ACCT 1201. Financial Accounting and Reporting. 4 Hours.
Covers the basic concepts underlying financial statements and the accounting principles followed in the preparation of the balance sheet, the income statement, and the statement of cash flows. Offers students an opportunity to become familiar with accounting terminology and methods designed to enable them to interpret, analyze, and evaluate published corporate financial reports. Wherever appropriate, the course relates current economic, business, and global events to accounting issues. Analyzes how financial reporting concepts affect the behavior of investors, creditors, and other external users. Emphasizes the importance of ethics in financial reporting. Requires second-semester-freshman standing or above.

ACCT 1202. Financial Accounting in a Global Context. 4 Hours.
Covers the basic concepts underlying financial statements and the accounting principles followed in the preparation of the balance sheet, the income statement, statement of equity, and the statement of cash flows. Compares and contrasts the International Financial Reporting Standards (IFRS) used in other countries with generally accepted accounting principles (GAAP) currently used in the United States. Relates current economic, business, and global events to accounting issues. Emphasizes the importance of ethics in financial reporting. Offers students an opportunity to become familiar with accounting terminology and methods and to understand how the information conveyed in financial reports affects the decision making of investors, creditors, and managers.

ACCT 1209. Financial Accounting and Reporting. 4 Hours.
Does not count as credit for business majors. Counts as ACCT 1201 for business minors only. Requires second-semester-freshman standing or above.

ACCT 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ACCT 2301. Managerial Accounting. 4 Hours.
Focuses on issues relevant to the public accounting profession and to internal auditors and managers in private or governmental organizations. Topics include legal liability and ethics, business and audit risk assessment, fraud detection and prevention procedures, planning of audit engagements, audit reports, other assurance services and reports, and the effect of information technology on the audit process. Offers students the opportunity to think critically about issues facing the auditing profession.

ACCT 2302. Managerial Accounting in a Global Context. 4 Hours.
Focuses on the development and use of information—especially financial information—for managerial decisions within the firm. Introduces managerial accounting concepts, analyses, and practices that support business decisions through class discussions, exercises, and case analysis. Topics include budgeting, cost management and behavior, cost-volume-profit analysis, relevant costs for decision making, cost allocation issues, and performance evaluation. Emphasizes the importance of ethics.

ACCT 2304. Business Law and Professional Ethics. 4 Hours.
Covers business law, professional code of conduct, and the importance of ethical behavior in today's business environment. Examines legal aspects of commercial transactions and business relationships. Specifically, laws relating to contracts and sale of goods under the Uniform Commercial Code, agency law, and product liability law are discussed. May not be used as an accounting concentration elective.

ACCT 3203. Auditing and Other Assurance Services. 4 Hours.
Focuses on issues relevant to the public accounting profession and to internal auditors and managers in private or governmental organizations. Topics include legal liability and ethics, business and audit risk assessment, fraud detection and prevention procedures, planning of audit engagements, audit reports, other assurance services and reports, and the effect of information technology on the audit process. Offers students the opportunity to think critically about issues facing the auditing profession.
ACCT 4414. Income Tax Determination and Planning. 4 Hours.
Provides a basic understanding of the structure of the federal income tax system. Taxes can have a significant impact on the viability of a number of personal finance and business decisions. Focuses on the individual taxpayer but also considers the implications for other entities. Tax return projects, research cases, and planning projects help demonstrate the potential impact of taxes on decision making.

ACCT 4501. Financial Reporting and Analysis 2. 4 Hours.
Continues ACCT 3401 with a more extensive study of financial statements and the financial reporting rules underlying them. Advanced topics include bonds, pensions, leases, earnings per share, and earnings management. Introduces more advanced financial statement analysis tools. Offers students an opportunity to continue to gain the ethical awareness and the knowledge necessary to analyze the impact of alternative reporting decisions on financial statements.

ACCT 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student's major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

ACCT 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student's major field. May be repeated without limit.

ACCT 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ACCT 4993. Independent Study. 1-4 Hours.
Allows students who have received approval to undertake independent study in lieu of any course required in the various concentrations. Students present proposals to an Independent Studies Committee for evaluation and approval. Every proposal requires a detailed outline of the objectives and plan of study and must be accompanied by a supporting statement from the supervising faculty member under whose direction the study takes place. A copy of the final report prepared by the student is presented to the appropriate Independent Studies Committee. Further information about the Independent Studies Program can be obtained from concentration coordinators. May be repeated without limit.

ACCT 5200. Financial Reporting and Managerial Decision Making 1. 3 Hours.
Continues ACCT 6200, offering the second of a two-course sequence that focuses on the acquisition, measurement, and management of firm resources. Students who do not meet course prerequisites or restrictions may seek permission of instructor.

ACCT 5201. Financial Reporting and Managerial Decision Making 2. 1.5 Hour.
Continues ACCT 6201, offering the second of a two-course sequence that focuses on the acquisition, measurement, and management of firm resources. Critical to the effective planning, implementation, and management of successful business strategies is the ability to measure and manage the commitment and utilization of entity resources. Focuses on contemporary methods and frameworks used in the process of measuring, analyzing, and allocating firm resources to achieve strategic and operating objectives. Required course for co-op MBA/part-time MBA.

ACCT 5232. Estate and Gift Taxation. 3 Hours.
Focuses on the study of the taxes common to the transfer of property and wealth. Topics include gift tax deductions and exclusions, estate valuation, state tax deductions and exemptions, and tax rates. Also explores planning opportunities for these wealth transfer taxes. Students who do not meet course prerequisites or restrictions may seek permission of instructor.

ACCT 5255. Forensic Accounting. 3 Hours.
Offers an overview of occupational fraud and the methodology of fraud examination (i.e., obtaining documentary evidence, interviewing witnesses and potential suspects, writing investigative reports, testifying to findings, and forensic document examination). Offers students an opportunity to learn how to detect the most common types of occupational fraud, determining how each type of fraud is committed, and implementing prevention strategies. Students who do not meet course prerequisites or restrictions may seek permission of instructor.

ACCT 5265. Internal Auditing. 3 Hours.
Offers an overview of the internal audit function and explores the duties and responsibilities of the internal auditor. Offers students an opportunity to learn about the planning and organizing of an internal audit department and its coordination with an outside auditor as well as to learn to analyze how the design of an internal control auditing process can reduce risk exposure and enhance internal controls. Students who do not meet course prerequisites or restrictions may seek permission of instructor.

ACCT 5576. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

ACCT 5978. Independent Study. 1-4 Hours.
Allows students who have received approval to undertake independent study in lieu of any course required in the various concentrations. Students present proposals to an Independent Studies Committee for evaluation and approval. Every proposal requires a detailed outline of the objectives and plan of study and must be accompanied by a supporting statement from the supervising faculty member under whose direction the study takes place. A copy of the final report prepared by the student is presented to the appropriate Independent Studies Committee. Further information about the Independent Studies Program can be obtained from concentration coordinators. May be repeated without limit.
ACCT 6204. Financial Reporting for Integrated Multinational Enterprises. 3 Hours.
Presents and discusses financial reporting practices for diversified, international business entities. In today's global business environment, many corporations operate diverse economic activities and often conduct those activities across geographic boundaries. Examines accounting and disclosure standards in the United States that are relevant to presenting consolidated financial statements. Also analyzes accounting and disclosure standards in other countries and those developed by international bodies with respect to their effects on reporting entities and the financial markets.

ACCT 6205. Auditing in a Big Data Environment. 3 Hours.
Intended for students with a prior course in assurance services and/or auditing. Focuses on the coverage of current significant issues in the assurance services and big data environment. Topics include the impact of technology on the audit process, client risk assessment and statistical data analysis, other assurance services and nonattestation engagements, and the use of complex decision aids. Emphasis is also on contemporary ethical and legal issues confronting the public auditing profession. Offers students the opportunity to think critically about a number of significant issues facing the auditing profession and also introduces impact of big data, the audit judgment, and decision-making process through the completion of a variety of audit cases.

ACCT 6206. Management Control Systems. 3 Hours.
Examines the systematic processes by which managers influence other members of the organization to implement the organization's strategies. Management control systems encompass both financial and nonfinancial measures used for planning, coordinating, communicating, evaluating information, and deciding actions. Topics include budgeting, capital budgeting, transfer pricing, performance measurement and evaluation, and performance-based incentives.

ACCT 6207. Contemporary and Emerging Issues in Financial Reporting. 3 Hours.
Focuses on the theoretical concepts of accounting with an examination of standards issued by various professional organizations including the FASB, SEC, and AICPA. Also examines emerging issues in corporate, governmental, and nonprofit financial reporting. Real-world cases are used to illustrate and discuss the complex financial reporting process and ethical issues confronted by the business community and accounting profession.

ACCT 6208. Financial Reporting and Managerial Decision Making. 4 Hours.
Offers students an opportunity to understand and utilize critical information in corporate financial reports to improve business decision making regarding the acquisition, measurement, and management of firm resources. Business managers make strategic decisions about acquiring and using a variety of resources. Effectively measuring and managing the acquisition and utilization of resources is critical to the implementation and management of successful business strategies. Teaches contemporary methods of financial reporting to external capital markets; analytic approaches used by external capital providers; and internal frameworks used to measure, analyze, and allocate firm resources to achieve strategic and operating objectives.

ACCT 6209. International Accounting and Reporting. 1.5 Hour.
Designed to enhance the ability of a manager in a global setting to understand the statements and be aware of issues that can make them incomparable or misleading. Many businesses operate in global markets, competing, hiring, purchasing, and selling across many country borders. International mergers and businesses not bound by geographic borders (banking, telecommunications) have accelerated globalization, challenging managers to understand how these developments influence business strategies and decision making. Financial reporting and accounting methods of financial performance differ across the world. The accounting choices and games differ, terminology and practices in disclosing the profits and asset values differ, and the interpretation of financial reports requires understanding of the cultures before one can assess the financial performance of a business.

ACCT 6210. Analyzing Financial Statements to Assess Firm Performance, Strategy, and Value. 3 Hours.
Provides students with the knowledge and skills necessary to assess the underlying economic condition and strategic direction of a firm through the analysis of its financial statements using a case-based approach. Identifies potential distortions contained in financial reports using techniques such as operating, financing, and investing cash flow analysis and through the examination of financial statement footnote disclosures. Performance measures are derived that eliminate distortions and improve the quality and comparability of financial information. These measures enable effective firm comparisons to key competitors and historical performance. Forecasted financial statements are utilized to make estimates of firm value.

ACCT 6211. Global Financial Statement Analysis. 1.5 Hour.
Designed to enhance the ability of a user of financial statements in a global setting to understand the statements and be aware of issues that can make them incomparable or misleading. Many businesses operate in global markets, competing, hiring, purchasing, and selling across many country borders. International mergers and the growing types of businesses not bound by geographic borders (banking, telecommunications, or Internet) have accelerated globalization, challenging managers, consultants, and investors to understand how these developments influence business strategies and decision making. Financial reporting and accounting methods that summarize financial performance of the business differ across the world. The accounting choices and games differ, terminology and practices in disclosing the profits and asset values differ, and the interpretation of financial reports requires understanding of the cultures before one can assess the financial performance of a business.

ACCT 6212. Fraud Detection and Prevention. 3 Hours.
Provides students with an awareness of a variety of frauds that affect business enterprises and individuals, such as fraudulent financial reporting, securities fraud, healthcare fraud, computer and Internet fraud, and identity theft. Occupational fraud and abuse cost U.S. organizations an estimated $400 billion annually. In addition to occupational fraud, such fraudulent schemes perpetrated against individuals as identity theft are also on the rise. Fraud awareness is a critical factor in its detection and prevention. Emphasizes fraud detection and prevention skills, and introduces students to the concepts of the fraud triangle, the fraud scale, and fraud risk management.
ACCT 6213. Managing Resources to Implement Strategy. 3 Hours.
Provides knowledge and skills to enable managers to design, implement, and evaluate systems used to manage the allocation of resources including time, energy, cash, and capital investment. To implement the organization’s strategy successfully requires managers to direct resources to key strategic tasks. Examines whether a firm’s existing management systems create the right incentives for managers and employees to support and advance its strategies by, for example, making appropriate capital investments, developing suitable new products, or providing effective customer support. Students integrate their knowledge of competitive strategy and organizational behavior with ideas about planning, budgeting, performance measurement, incentive compensation, and capital budgeting to determine how to design systems that increase strategic success.

ACCT 6215. Corporate Government Ethics and Financial Reporting. 1.5 Hour.
Deals with issues related to corporate governance and audit committee mechanisms in preventing financial reporting disasters and in providing high-quality financial reports to global capital markets. Emphasizes the role of the board of directors and its committees, management, shareholders, external auditors, and internal auditors in developing sound ethical practices and a good corporate governance culture. Examines efforts by legislative and regulatory bodies and the accounting profession in improving financial reporting transparency and auditor independence.

ACCT 6216. Financial Reporting for Governments and Nonprofit Entities. 2 Hours.
Covers business issues and financial reporting standards for state and local governments within the United States, as well as for nonprofit organizations. These organizations make up a large and growing share of the economy, and so it is important to consider whether the funds entrusted to them by taxpayers and donors are being used effectively. These entities have unique ways of reporting their financial results, based on their specific business purposes and the needs of their constituents. The course discusses these reporting methods and the use of the resulting financial reports in evaluating performance within the government and nonprofit contexts.

ACCT 6217. Corporate Governance, Ethics, and Financial Reporting. 3 Hours.
Deals with issues related to corporate governance and audit committee mechanisms in preventing financial reporting disasters and in providing high-quality financial reports to global capital markets. Emphasizes the role of the board of directors and its committees, management, shareholders, external auditors, and internal auditors in developing sound ethical practices and a good corporate governance culture. Examines efforts by legislative and regulatory bodies and the accounting profession in improving financial reporting transparency and auditor independence.

ACCT 6218. Financial and Management Accounting. 4.5 Hours.
Covers financial accounting and management accounting. Financial accounting offers an opportunity to develop an understanding of financial statements, the critical financial foundation and language of business. Management accounting offers an opportunity to develop the ability to use financial accounting, other financial information, and nonfinancial information to evaluate the impact of alternate business decisions on profitability and cash flow.

ACCT 6219. Advanced Business Law. 1.5 Hour.
Examines the key concepts of business law. Topics include agency issues, fundamentals of contracts, Uniform Commercial Code, debtor-creditor relationship, and the governmental regulation of business.

ACCT 6220. Corporate Financial Reporting and Decision Making 1. 3 Hours.
Examines the development of financial reports including their underlying concepts and measurement theories. Corporate financial reporting is a dynamic process in which information is provided to internal and external decision makers to assist them in the effective allocation of economic resources. Examines the legal, economic, and political processes that influence the financial reporting process.

ACCT 6221. Corporate Financial Reporting and Decision Making 2. 6 Hours.
Continues ACCT 6220. Examines corporate financial reporting in the decision-making process. Emphasis is on the economic consequences of alternative financial reporting practices. Provides students with the ability to understand and utilize critical information contained in corporate financial reports to improve business decision making.

ACCT 6222. Corporate and Governmental/Nonprofit Financial Reporting and Decision Making. 6 Hours.
Continues the study of corporate financial reporting, covering specialized topics that assume knowledge of the accounting principles covered in the first two courses. Topics include corporate reporting as equity instruments, executive compensation, reporting of fund flows, and reporting and disclosures for corporations engaged in diverse economic activities and those operating across geographic boundaries. Examines accounting and disclosure standards in the United States and in other countries, as well as standards developed by international bodies. Covers financial reporting models used by governmental and nonprofit entities.

ACCT 6223. Audit and Other Assurance Services. 6 Hours.
Introduces the attest function and its application to financial statement opinion audits and other assurance services common in today’s professional environment. Emphasizes a risk-based approach to audit planning, the internal control structure, and the control environment; the design of test of controls, substantive tests, and the resultant audit report. Topics include audit sampling, audit evidence, audit procedures, workpaper preparation, the impact of information technology on the audit process, and the auditor’s responsibility to detect fraud. A primary focus is on the auditor’s legal and ethical responsibilities. Emphasis is also on operational audits, compliance audits, reviews, compilation, and other attestation services.

ACCT 6224. Taxation of Individuals and Business Entities. 6 Hours.
Introduces the principles of taxation including income and expenses, tax accounting methods, and the tax implications of property transactions (including the calculation of basis as well as gains and losses). Emphasizes tax compliance, planning, and research as they impact the decision-making process for individuals, corporations, and flow-through entities.

ACCT 6225. Accounting Information Systems. 3 Hours.
Provides students with an opportunity to utilize basic management information systems concepts to examine typical business processes. Information systems play a critical role in all aspects of planning, organizing, and controlling an organization and in helping the organization to achieve its operational and strategic objectives. Topics include objectives and procedures of internal control, how to determine and satisfy the information requirements of system users, typical business documents and reports, system documentation and analysis, and the effect of e-commerce and Internet-based technologies on accounting information systems.
ACCT 6226. Strategic Cost Management. 3 Hours.
Examines the strategic decisions that managers need to make concerning the acquisition, measurement, and management of firm resources. Focuses on the strategic use of cost information for planning and controlling, and the use of cost analysis in making critical business decisions.

ACCT 6227. Accounting for Business Combinations. 3 Hours.
Examines the conceptual and practical aspects of business combinations. Topics include mergers and acquisitions, purchase accounting, cost vs. equity method, and accounting for intercompany transactions between a parent company and its subsidiaries.

ACCT 6228. Contemporary Issues in Accounting Theory. 3 Hours.
Offers a capstone course on the theoretical concepts of accounting, with a focus on standards issued by various professional organizations including the FASB, SEC, and AICPA. Examines emerging issues in financial reporting. Real-world cases are utilized to illustrate the complex financial reporting issues confronted by the business community and accounting profession.

ACCT 6229. Accounting for Foreign Currency Transactions. 1 Hour.
Examines the accounting and reporting issues facing multinational enterprises operating in foreign countries. Business transactions that are denominated in foreign currency may result in risk for the entity as a result of fluctuations in exchange rates. This course evaluates risk management techniques by use of forward exchange contracts and other financial derivatives. Covers reporting issues dealing with the translation of foreign entities financial statements into U.S. dollars and appropriate remeasurement techniques.

ACCT 6231. Corporations and Shareholders. 3 Hours.
Provides an in-depth study of the tax issues related to the corporate form and the corresponding tax implications for its shareholders. Given the importance of corporations in the federal income tax system, an understanding of the tax issues related to this type of business is essential for tax professionals. Topics include capital formation and structure, the operations of the corporation, distributions, dividends and redemptions, sales and liquidations, and taxable and tax-free reorganizations.

ACCT 6232. Tax Research Methodology. 1.5 Hour.
Provides an opportunity for students to develop and enhance their tax research skills. Success as a tax professional often hinges on the ability to find solutions effectively and efficiently. In addition to covering the creation of various sources of tax authority, also introduces students to a variety of research resources. Students are required to complete written research reports.

ACCT 6233. Tax Practice, Procedure, and Ethics. 1.5 Hour.
Investigates the procedures used in dealing with the Internal Revenue Service, with an emphasis on practitioner responsibilities. Reviews the organization of the IRS, filing requirements, appeal procedures, civil/criminal statutes, assessments, and protests. Also examines a study of the value and moral judgments inherent in the field of taxation including client confidentiality, disclosure of false or misleading information, and advice counter to the law or public good.

ACCT 6235. Partners and Partnerships. 3 Hours.
Provides an in-depth study of the tax issues related to one of the central flow-through entities, the partnership. The increasing popularity of flow-through entities as an organizational form has made an understanding of the tax issues related to this type of entity an important area of study for tax professionals. Topics include capital formation, operations, transactions between the partner and the partnership, distributions, sales of partnership interests, and liquidation of the partnership.

ACCT 6236. Reorganizations. 1.5 Hour.
Examines the tax impact of the transfer of stock, securities, and property in connection with acquisitions, divestitures, and other business ownership changes. Topics include the taxability of the transactions, the basis of property exchanged, corporate liquidations, tax attributes available to successors of an interest, and the overall impact to both the acquirer and the acquiree. Also discusses planning for the optimization of tax benefits.

ACCT 6237. Consolidated Returns. 1.5 Hour.
Focuses on the procedures and statutes of taxing a multicorporate entity as a single taxpayer. Particular attention is paid to eligibility requirements, intercompany transactions, accounting adjustments, the impact of net operating losses, excess loss accounts, and the basis of property.

ACCT 6238. Income Tax Accounting. 1.5 Hour.
Investigates the accounting treatment accorded current and deferred income tax liabilities and expenses. Topics include accounting methods and periods (particularly in cases where the accounting and tax records differ), special elections available to taxpayers, installment reporting, inventory methods, long-term contract accounting, and cash vs. accrual reporting.

ACCT 6239. State and Local Taxation. 3 Hours.
Addresses the most common types of taxes imposed by state and local governments. Examines state and local income, sales, excise, property, and city taxes. Emphasis is on the underlying principles governing the application of each type of tax and the interrelationships where they exist.

ACCT 6240. International Taxation: Inbound Transactions. 3 Hours.
Addresses the taxation of foreign individuals or corporations receiving income from sources, or conducting business, in the United States. With the globalization of the economy, a greater number of taxpayers must consider the impact of international taxation. Topics include the sourcing of income, taxation of passive income, taxation of income connected to a U.S. trade or business, branch-level taxes, issues of foreign-owned U.S. corporations, income tax treaties, and transfer pricing.

ACCT 6241. International Taxation: Outbound Transactions. 3 Hours.
Examines the federal taxation of U.S. individuals receiving income from sources or conducting business in foreign jurisdictions. An increase in the number of U.S. individuals and corporations operating in other countries has enhanced the importance of an understanding of international transactions for tax professionals. Examines sourcing of income, allocation and apportionment of deductions, foreign tax credits, taxation of U.S. citizens and residents abroad, controlled federal corporations, passive foreign investment companies, foreign currency translations and transactions, and special entities.

ACCT 6242. Taxation of Financial Instruments. 1.5 Hour.
Provides an overview of the federal taxation of financial instruments. Topics include transactions in stock, debt securities, commodities, options, futures and foreign currency transactions, taxation of the time value of money inherent in financial instruments, tax treatment of risk management strategies and investment entities, such as regulated investment companies, and tax information reporting.

ACCT 6243. Advanced Flow-Through Entities. 3 Hours.
Offers an in-depth look at the tax consequences of businesses formed as flow-through entities (including partnerships, S corporations, and LLCs). Discusses allocation rules, liability sharing rules, disguised sales rules, partnership debt workouts, the S corporation election, and tax treatment of shareholders in an S corporation.
ACCT 6244. Tax Exempt Entities. 1.5 Hour.
Examines organizations exempt from income tax under Subchapter F of the Internal Revenue Code. Focuses on the requirements for exemptions, feeder organizations, charitable organizations, private foundations, and business income of certain exempt organizations.

ACCT 6245. Strategic Tax Planning. 1.5 Hour.
Uses the life cycle of the firm as the framework for examining the strategic tax planning issues that tax professionals need to consider. Emphasis is on the legal, capital, and tax factors related to the formation of the new business enterprise, international and multinational considerations, executive compensation (including stock options and stock-related compensation programs), and succession planning for the family business.

ACCT 6246. Retirement Plans. 3 Hours.
Examines employee benefit plans including requirements for qualification, funding, coverage, and distribution requirements. Discusses a variety of plans including pension, profit-sharing, CODAs, IRAs, SEPs, TSAs, and stock plans.

ACCT 6247. Estate Planning. 1.5 Hour.
Examines strategies for maximizing personal goals (including probate avoidance, tax minimization, and asset protection) related to property passed from one generation to another. Emphasis is on wills and other vehicles for estate planning; the principles of estate taxation; the impact of employee benefits, trusts, and their taxation; and life insurance policies and associated annuities.

ACCT 6248. Income Taxation of Trusts and Estates. 3 Hours.
Examines the general rules for the taxation of estates and trusts. Topics include trusts that distribute current income only, grantor trusts, irrevocable trusts, charitable vehicles, income in respect of a decedent, estates and trusts that may accumulate income or may distribute corpus, and treatments of excess distributions and beneficiaries.

ACCT 6249. Financial Planning for Investments. 3 Hours.
Surveys the investment products that can be used for financial planning. Emphasis is on constructing the investment plan, the investment policy statement, the asset allocation strategy, and implementation recommendations.

ACCT 6250. Financial Planning for Insurance. 3 Hours.
Surveys insurance products used for financial planning. Topics include life, accident, health, disability, long-term care, homeowner, auto, and personal liability, with emphasis on personal risk management and the use of insurance products in the financial planning process.

ACCT 6251. Executive Compensation. 1.5 Hour.
Provides an understanding of the key tax concepts involved in the various compensation arrangements used to achieve the goal of attracting and retaining key executives, which is essential to the success of many companies. Topics include incentive stock options, nonqualified deferred compensation, golden parachute rules, and Internal Revenue Code Section 83 issues.

ACCT 6252. Taxation of E-Commerce. 1.5 Hour.
Provides an overview of the current state of Internet taxation including the Internet Tax Freedom Act and what proposals Congress and others are considering. Also examines how investment management firms can position themselves to optimize both their current and future Internet taxation position.

ACCT 6253. Ethics in the Accounting Profession. 3 Hours.
Focuses on the roles and ethical responsibilities in the accounting, auditing, and tax professions. Also covers ethical behavior by management as well as the legal guidelines that apply in a business setting.

ACCT 6254. Accounting Research and Communication. 3 Hours.
Requires students to research and analyze auditing issues by using quantitative and/or qualitative research methods. Offers students an opportunity to learn how to more effectively communicate those findings in a professional format.

ACCT 6257. Tax Research and Communication. 3 Hours.
Requires students to research and analyze tax issues by using quantitative and/or qualitative research methods. Offers students an opportunity to learn how to more effectively communicate those findings in a professional format.

ACCT 6260. Advanced Topics in Accounting. 3 Hours.
Offers an in-depth examination of selected issues and problems in accounting that are of current interest to faculty and students. Specific topics alternate depending on faculty availability and interest as well as student enrollment criteria. May be repeated without limit.

ACCT 6261. Advanced Topics in Accounting. 1 Hour.
Offers an in-depth examination of selected issues and problems in accounting that are of current interest to faculty and students. Specific topics alternate depending on faculty availability and interest as well as student enrollment criteria. May be repeated without limit.

ACCT 6262. Advanced Topics in Accounting. 1.5 Hour.
Offers an in-depth examination of selected issues and problems in accounting that are of current interest to faculty and students. Alternates specific topics depending on faculty availability and interest as well as student enrollment criteria. May be repeated without limit.

ACCT 6263. Government and Nonprofit Accounting. 3 Hours.
Covers the reporting methods government entities use to report their financial status, including the use of general fund accounting and special fund accounting. Also discusses the financial reporting standards for nonprofit entities. Governmental and nonprofit entities have unique ways of reporting their financial status, based on their specific business purposes and the needs of their constituents or donors.

ACCT 6264. Planning for Estate Tax Issues. 3 Hours.
Examines advanced strategies for maximizing personal goals (including probate avoidance, tax minimization, and asset protection) related to property passed from one generation to another. Emphasizes trust vs. will planning and other vehicles for estate planning; the principles of estate taxation; the impact of employee benefits, trusts, and their taxation; and life insurance policies and associated annuities.

ACCT 6265. Tax Accounting for Income Taxes. 3 Hours.
Investigates the reporting of uncertain positions and accounting treatment accorded current and deferred income tax liabilities and expenses. Topics include accounting for uncertain tax positions, accounting methods and periods (particularly in cases where the accounting and tax records differ), special elections available to taxpayers, installment reporting, inventory methods, long-term contract accounting, and cash vs. accrual reporting.

ACCT 6270. Financial Accounting and Decision Making. 4 Hours.
Offers students an opportunity to understand how an entity’s economic activity is measured and reported for internal decision making and external communication with capital providers. Thoroughly examines the underlying assumptions of enterprise financial statements as well as the accounting techniques employed to create them. Also addresses the analysis of financial statements for the purpose of predicting the future performance and growth of the firm. Explores the financial strategies, policies, and methods utilized by technology-driven organizations to measure and create shareholder value.
ACCT 6271. Managerial Accounting and Decision Making. 4 Hours. Addresses the concepts, problems, and issues related to the measurement and internal use of economic information regarding the resources used in the process of producing goods and providing services. Introduces the conventional methods of internal reporting used in planning, control, and decision making, with a constant focus on the efficient and effective use of enterprise resources. Also examines fundamental aspects of cost behavior and cost accounting, flexible budgeting, capital budgeting, variance analysis, and management control systems.

ACCT 6272. Financial Statement Preparation and Analysis. 2.25 Hours. Offers students an opportunity to understand how to prepare corporate financial reports and utilize critical information in these reports to improve business decision making. Introduces contemporary methods of financial statement analysis used by internal decision makers and external capital providers.

ACCT 6273. Identifying Strategic Implications in Accounting Data. 2.25 Hours. Focuses on developing and analyzing accounting information to identify strategic implications and, using that information, to make effective decisions in various business functions that must work together for overall strategic success. Introduces key management accounting concepts and techniques, including the impact of different cost behaviors, activity-based costing, evaluating profitability of products and customers, flexible budgeting, and variance analysis. Offers students an opportunity to learn about the data they develop to think objectively about the business, to ascertain why a situation occurs, to identify the implications of data for management decisions, and to use the data to discover strategically important opportunities and challenges.

ACCT 6280. Planning and Budgeting for Innovation. 3 Hours. Covers the fundamental methods by which the financial successes and failures of business enterprises are measured and reported to management and external capital providers. Offers students an opportunity to become proficient at analyzing financial statement information in order to assess the effects of business decision making on firm performance. Addresses analytics focusing on the identification of capital to fund innovation initiatives in conjunction with metrics to measure the potential value associated with new product and service offerings. Seeks to help students understand how management decisions and innovation initiatives affect enterprise financial statements and shareholder perceptions of value creation.

ACCT 6281. Measuring and Managing the Costs of Production and Growth. 3 Hours. Explores the information managers need to effectively and efficiently run their business operations. Offers students an opportunity to learn how to identify and analyze the information needed for decision making in diverse service-, product-, and manufacturing-oriented industries. Topics include determining the costs and profitability of products and services; analyzing the cost savings related to outsourcing opportunities; estimating and assessing the financial impact of new products, new marketing, and other programs; budgeting for operating businesses and new ventures; variance analysis; and cost management. Offers a fundamental managerial accounting skills course that seeks to enable students to make management decisions armed with specific and the most appropriate financial information.

ACCT 6282. Design and Management of Control Systems within Dynamic Organizations. 3 Hours. Deals with the design and utilization of control systems for fast-moving, innovative firms. Includes the policies, tools, metrics, and procedures an organization employs to manage the strategy-implementation process. Topics include responsibility accounting, transfer pricing, performance measurement and evaluation, as well as designing control systems for cost allocation, budgeting, and variance analysis systems. Also includes the linkage between performance measurement and enterprise resource planning systems. Asks students to evaluate effectiveness of a control system in their own companies to show how these concepts apply to practice.

ACCT 6290. Interpreting and Evaluating Financial Statements. 3 Hours. Offers students an opportunity to develop skills required to interpret, analyze, and evaluate the financial statements published in corporate annual reports. Also offers an opportunity to learn accounting terminology, basic accounting concepts, and the accounting principles underlying the preparation of financial statements. Understanding the structure that lies beneath financial statements is vital to being able to analyze and estimate the effects of events on the firm’s income and financial position.

ACCT 6291. Identifying Strategic Implications in Accounting Data. 3 Hours. Emphasizes developing and analyzing accounting information to identify strategic implications and, using that information, to make effective decisions in various business functions that must work together for overall strategic success. Introduces key management accounting concepts and techniques, including the impact of different cost behaviors, activity-based costing, evaluating profitability of products and customers, flexible budgeting, and variance analysis. Offers students an opportunity to learn about the data they develop to think objectively about the business, to drill down to ascertain why a situation occurs, to identify the implications of data for management decisions, and to use the data to discover strategically important opportunities and challenges.

ACCT 6292. Tax Research, Practice, and Ethics. 3 Hours. Offers students an opportunity to develop and refine their tax research skills through practical exercises. Covers the creation of various sources of tax authority. Exposes students to the procedures used in dealing with the Internal Revenue Service (IRS), with an emphasis on practitioner responsibilities. Reviews the organization of the IRS, filing requirements, appeal procedures, civil/criminal statutes, assessments, and protests. Includes a study of the value and moral judgments inherent in the field of taxation, including client confidentiality, disclosure of false or misleading information, and advice counter to the law or public good.

ACCT 6960. Exam Preparation—Master’s. 0 Hours. Offers the student the opportunity to prepare for the master’s qualifying exam under faculty supervision.

ACCT 6962. Elective. 1-4 Hours. Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ACCT 6964. Co-op Work Experience. 0 Hours. Provides eligible students with an opportunity for work experience. May be repeated without limit.

ACCT 7976. Directed Study. 1-4 Hours. Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.
ACC 0103. Managerial Accounting. 2 Hours.
Offers students an opportunity to learn how to perform a cost-benefit analysis, how to analyze cost-volume relationships, and how to apply ratio analysis to financial statements, such as the statement of cash flows. Knowledge or prior experience in accounting recommended.

Examines the development of financial statements, including the underlying concepts and measurement theories. Emphasizes the analysis and use of these statements to make decisions. Covers issues in financial reporting, valuation, and income measurement. Topics include inventories, plant and equipment, bonds, present value, and stockholders’ equity.

ACC 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ACC 2100. Financial Accounting. 3 Hours.
Examines the development, objective, and purpose of financial statements. Emphasizes the preparation, analysis, and use of these statements to make operating, financial, and investment decisions. Covers the underlying methods, concepts, principles, and measurement theories. Topics include understanding the operating cycle, receivables, inventories, plant and equipment, intangible assets, liabilities, bonds, ownership, and stockholders’ equity. Special topics include the mathematics of present value theory, calculations, and applications.

ACC 2200. Managerial Accounting. 3 Hours.
Examines the fundamental tools and principles of managerial accounting for decision-making purposes, including planning and control. Covers cost determination, assignment, definition, and behavior. Requires students to prepare management accounting reports and statements for internal decision-making purposes, including the preparation of budgets and contribution margin statements. Topics include job order, process costing, activity-based costing (ABC), inventory techniques, variance analysis, CVP analysis, and budgeting.

ACC 3103. Cost Accounting. 3 Hours.
Continues in greater depth the study of managerial accounting for decision-making purposes, including profitability, planning, and control. Studies cost analysis and explores statistical methods in measuring cost behavior, overhead, and fixed costs. Emphasizes capital budgeting techniques for equipment replacement and long-term asset management given the relevant range of productive capacity. Compares and analyzes decentralization, segment, and divisional management accounting. Topics include marginal cost relevancy, make-or-buy decisions, multiple product cost assignment and production methods, joint costs and by-products, responsibility accounting, activity-based costing, just-in-time cost systems, economic value added, residual income, the balance scorecard, and return on investment techniques.

ACC 3201. Financial Reporting and Analysis 1. 3 Hours.
Examines in greater depth the foundational principles, concepts, and measurement theories relating to financial reporting and stewardship. Focuses on the objectives of financial statements for various users such as lenders, investors, and various stakeholder groups. Emphasizes the accounting conceptual framework, including the guidance and standards promulgated by various standards-setting and regulatory bodies. Topics include the measurement, valuation, and disclosure of receivables, inventories, tangible and intangible assets, depreciation methods, revenue-recognition principles, and required footnotes.

ACC 3202. Financial Reporting and Analysis 2. 3 Hours.
Continues the examination in greater depth of the foundational principles, concepts, and measurement theories relating to financial reporting and stewardship. Focuses on the objectives of financial statements for various users such as lenders, investors, and various stakeholder groups. Emphasizes the accounting conceptual framework, including the guidance and standards promulgated by various standards-setting and regulatory bodies. Topics include the measurement, valuation, and disclosure of liabilities, bond obligations, retirement obligations, reconciliation of deferred taxes and required tax disclosures, various corporate ownership interests, stock options, accounting changes, statement of cash flows, and required footnotes.

ACC 3410. Principles of Taxation. 3 Hours.
Covers the objectives and principles of taxation, including the economic policy underlying various tax systems—property, consumption, value added, federal, and state income tax regimes. Explores the marginal tax structure and studies the component parts of the tax accounting equation in full, including the definitions and terminology described in the U.S. tax code. Emphasizes the tax compliance responsibilities and tax accounting methods and required reporting obligations for individuals, corporations, and various pass-through entities such as partnerships and subchapter S corporations.

ACC 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ACC 4320. Financial Statement Analysis. 3 Hours.
Explores the process, tools, principles, and concepts of financial reporting, financial statement analysis, and valuation used by investors and analysts. Covers analysis of financial information and firm-specific data, emphasizing the structure of financial statements. Focuses on use of this data for equity and debt valuation as part of security analysis and portfolio management. Studies analysis of individual investments, focusing on pricing shares of stock and creating valuation models and specific criteria used in lending decisions. Topics include models of intrinsic value; comparison of accrual accounting and discounted cash flow approaches to valuation; analysis of firm profitability, growth, risk analysis, and value generation; and assessment of accounting quality, forecasting earnings and cash flows, pro forma analysis for strategy and planning, and study of nonfinancial metrics.

ACC 4330. Principles of Auditing. 3 Hours.
Examines audit principles, concepts, and standards relevant to the attest function. Explores the objectives of audited financial statements performed by certified public accountants in compliance with AICPA auditing standards, PCAOB standards and guidelines, and SEC rules and regulations for publicly held companies. Also explores the objectives of audited financial statements and other lower-level services (such as reviews and compilations) performed for privately held nonprofit companies. Topics include ethical and legal liabilities of the auditor, including the independence and skepticism requirement, internal control, audit evidence, audit procedures, audit compliance and substantive testing, statistical sampling, transaction cycle testing, and the role of the audited reports on the efficiency of capital markets.
ACC 4410. Advanced Taxation. 3 Hours.
Continues the study of taxation, including tax-planning strategies, the tax legislative process, tax controversies and litigation, the hierarchy of tax authorities, and tax research and writing techniques. Emphasizes the tax-planning techniques and opportunities for individuals and businesses to avoid or minimize the present value of tax liabilities through property acquisitions; exchanges and disposions; deferred and installment sales; corporate reorganizations; liquidations; and other pass-through entity structures such as limited liability companies, trusts, estates, and personal holding companies. Integrates the analysis of legislative motives to provide incentives to promote desired economic and social behavior and to exact penalties to discourage undesirable economic and social activity.

ACC 4420. Advanced Accounting. 3 Hours.
Covers Securities and Exchange Commission reporting requirements, including segment and interim reporting requirements for large publicly held companies. Focuses on the equity method of accounting for investments; consolidations of financial information and consolidated reporting requirements for activities subsequent to the date of acquisition; consolidated financial statements as they pertain to outside ownership, intercompany asset transactions, and ownership patterns and income taxes; and intercompany debt, consolidated statement of cash flows, and other multi-entity issues. Other related matters covered include multinational accounting for foreign currency transactions and financial instruments, including the currency translation of foreign entity financial statements. Special advanced topics include accounting for partnerships, estates and trusts, fund accounting, bankruptcy liquidations and reorganizations, and accounting for governmental units and not-for-profit entities.

ACC 4896. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major.

ACC 4950. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

ACC 4955. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ACC 4983. Topics. 1-4 Hours.
Covers special topics in accounting. May be repeated without limit.

ACC 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ACC 4991. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

ACC 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ACC 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ACC 4994. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

ACC 4995. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

ACC 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ACC 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

ACC 6210. Forensic Accounting Principles. 4 Hours.
Seeks to provide students with a broad conceptual overview of the field of forensic accounting, the key internal controls required to deter/detect frauds or abuse, and the newly enacted corporate governance laws. Covers the roles, responsibilities, and requirements of a forensic accountant, basic legal and fraud examination theory; ethics in business; identifying the major types of cash, payroll, and other financial fraud schemes; detailed examination of the proper required internal audit controls (transaction authorization, segregation of duties, supervision, adequate documentation and records, physical safeguards, independent verification); and accounting/auditing standards and corporate governance needed to comply with the AICPA, SAS, CFE, government regulations, and Sarbanes-Oxley 2002 legislation. Discusses actual fraud cases to highlight the impact of auditing and forensic accounting on businesses and our society.

ACC 6220. Dissecting Financial Statements. 4 Hours.
Offers students an opportunity to learn how to review, detect, and investigate possible financial statement concerns of publicly and privately held businesses, as well as nonprofit organizations and family businesses. Financial records of the companies studied span a variety of industries. Topics include legal elements of financial statement fraud, management’s and auditor’s responsibilities, improper revenue/sales recognition, inadequate disclosure of related-party transactions, improper asset valuation, improper deferral of costs and expenses, financial statement red flags, and inadequacies in management’s discussion and analysis. Addresses such factors as off-balance-sheet activity, liquidity, financial performance indicators, unreported intangibles, and lease auditing. Typical cases could include WorldCom, Enron, Rite Aid, Crazy Eddie, and ESM Government Securities.

ACC 6230. Investigative Accounting and Fraud Examination. 4 Hours.
Offers students an opportunity to learn how to identify and investigate accounting frauds and irregularities. Includes the in-depth review of sophisticated fraud schemes; how fraudulent conduct can be deterred; how allegations of fraud should be investigated and resolved; the recovery of assets; methods of writing effective reports; complying with SAS 82 and other fraud standards; and recent antiterrorist and money-laundering regulations, including the Patriot Act of 2002. Sessions are interactive, with students working through actual cases, developing investigative strategies, and seeking to prove how the fraud was committed. Topics covered include acts of skimming, cash larceny, check tampering, register disbursement schemes, billing schemes, payroll and expense reimbursement schemes, improper accounting of inventory and other assets, corruption, bribery, conflicts of interest, security fraud, and insurance fraud.
ACC 6240. Litigation Support. 4 Hours.
Covers the litigation process and civil and criminal statutes used to prosecute white-collar crimes. Offers students the opportunity to learn the appropriate analytical tools to quantify values for future earnings or damages resulting from fraud, breach of contract, or insurance disputes and to perform business valuations, including those arising from hostile situations such as divorce. Topics covered include how to assist in obtaining documentation necessary to support or refute a claim, assist in the examination for discovery, formulate questions to be asked regarding the financial evidence, review an opposing expert’s damages report and report on both the strengths and weaknesses of the positions taken, assist with settlement discussions and negotiations, and provide assistance at trial in testimony or with cross-examination.
ACC 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.
ACC 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
ACC 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.
ACC 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.
ACC 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.
ACC 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.
ACC 6983. Topics. 1-4 Hours.
Covers special topics in accounting. May be repeated without limit.
ACC 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

AFRS 1180. African History. 4 Hours.
Explores the history of the African continent from 1000 C.E. to the present era. Topics include medieval kingdoms (Ghana, Mali, Songhai, Zimbabwe, the city-states of East Africa, and the Kongo kingdom); slave trades (Indian Ocean, trans-Saharan, and transatlantic); the partition of Africa and European colonization; and the decolonization process. Due consideration is given to the interactions of African peoples with the rest of the world, particularly the relations between Africa and Europe after 1500 C.E.
AFRS 1185. Gender in the African Diaspora. 4 Hours.
Studies variations in gender roles throughout the African Diaspora, from precolonial Africa to the modern United States. Areas of the African Diaspora include Africa, the West Indies, Latin America, Europe, and the Islamic world. Issues include sexuality, labor, reproduction, and social constructions of gender. AFRS 1185, INTL 1185, and WMNS 1185 are cross-listed.
AFRS 1270. Introduction to Global Health. 4 Hours.
Introduces global health in the context of an interdependent and globalized world focusing on four main areas of analysis: infrastructure of global health; diseases; populations; and terms, concepts, and theories. While the focus is on lower-income countries, the course examines issues in a broader global context, underscoring the interconnections between global health disparities and global health policy response. Applies case studies describing interventions to improve healthcare in resource-poor settings in sub-Saharan Africa and elsewhere to help illuminate the actors, diseases, populations, and principles and frameworks for the design of effective global health interventions.
AFRS 1270 and PHTH 1270 are cross-listed.
AFRS 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
AFRS 2307. Africa Today. 4 Hours.
Offers a basic survey of the latest innovations and cultural and socioeconomic trends of 21st-century Africa. Examining the political transformations of 54 nations, the course focuses on a culturally and ethnically diverse continent of five regions, linguistic and religious diversity, and tribal societies reflecting an ancient triple heritage—indigenous, Arab, and European. Presents complex and critical perspectives on topics including governance and civil strife, gender empowerment, the impact of globalization, trade and investment developments, public health challenges, the visual and performing arts, identity formation among a rising youth demographic to pervasive mobile technology, food security, and the new “African” passport.
AFRS 2348. Arts and Culture of Africa. 4 Hours.
Presents a multidisciplinary approach to the study of art and culture of an African nation taught in a specified African country. Students have the opportunity to interact with master artisans in the areas of music, art, dance, literature, and film. Offers students the opportunity to gain a more global understanding of the role of art and culture on the development of African countries. May be repeated without limit.
AFRS 2390. Africa and the World in Early Times. 4 Hours.
Addresses the place of Africa in the world, from human evolution to the establishment of large-scale iron-making societies. Examines debates on the evolution of man in Africa and migrations to other regions. Traces the formation and spread of language groups, the rise of agriculture, formation of family and political structures, and patterns of trade up to 1000 C.E.

AFRS 1181. Introduction to African Studies. 4 Hours.
Uses a multidisciplinary approach to offer an introduction and overview of the geographical, demographic, socioeconomic, and political conditions of the African continent, emphasizing sub-Saharan Africa. Africa, “the cradle of humankind,” is a vast, complex continent of diverse peoples that has fascinated observers and evoked multiple images. Topical areas of interest range from ethnic relations, politics, colonial experience, and international relations to religion, environment, health, economic development, gender, culture, and literature. Course materials aim to provide contemporary African perspectives and analyses that offer students an opportunity to acquire and interpret broad knowledge about the continent.
AFRS 1182. The African Experience through Music. 4 Hours.
Surveys various African musical traditions with respect to their historical, social, and cultural heritage. Examines traditional and contemporary African music, instruments, and performance traditions. Not open to students who have taken MUSC 1128.
AFRS 2391. Modern African Civilization. 4 Hours.
Explores African history and culture from the early 1500s to the present era. Emphasizes the relationship between Europe and Africa, the circumstances surrounding the imperialist partition of Africa, and the decolonization process.

AFRS 2392. African Diaspora. 4 Hours.
Explores the creation and transformation of the African Diaspora-connections among communities of African descent in Africa, the Americas, Europe, and Asia. Centers on the years from 1500 to the present and emphasizes connections among themes of migration, identity, and popular culture.

AFRS 2414. Global Revolution. 4 Hours.
Introduces and immerses students in Kenyan African culture, the Swahili languages; and cultural dynamics. Exposes students to the major local population. Offers students an opportunity to learn Swahili, which is critical thinking.

AFRS 2465. The Scope and Dynamics of Conflicts in Africa. 4 Hours.
Surveys the faces, character, and manifestations of violent and nonviolent conflicts across the landscape of continental Africa. Addresses the causes/sources of conflict, types of conflicts and their impact on society, and the conflict resolution mechanisms. The contemporary history of the continent of Africa is defined most markedly by conflict that has impacted heavily on the continent’s diverse multicultural societies, politics, and economies. The structure of conflicts in the continent is complex and, indeed, exhibits diverse faces; conflicts differ in their roots, causes, and explanations and between the different regions and population groups in the south, east, central, west, and north. The course critically analyzes this broad range of aspects with specific focus on sub-Saharan Africa using country- and case-based analyses and critical thinking.

AFRS 2900. Swahili, Culture, and Politics in Kenya. 4 Hours.
Introduces and immerses students in Kenyan African culture, the Swahili language and politics, and studies their impact on the everyday life of the local population. Offers students an opportunity to learn Swahili, which is the national language of Kenya; its use in a context of varied indigenous languages; and cultural dynamics. Exposes students to the major issues that characterize everyday life in rural and urban settings through visits to and stays in the rural areas and transect walks in villages and urban communities. Students visit projects run by community-based organizations, observing the everyday life of ordinary Kenyans and attending formal and informal classes and settings on Swahili language, culture, and the local politics.

AFRS 3310. Applied Research in the African Diaspora. 4 Hours.
Introduces students to three major types of evidence used in basic and applied research in Africa and its worldwide Diaspora: written documentation; orally gathered information; and visual materials, artifacts, and material culture. Covers methods of data gathering such as archival research, participant observation, interviews, and archaeological excavation. Discusses various qualitative and quantitative techniques of verifying, analyzing, interpreting, and reporting or displaying the research findings. Emphasis is on selecting types of evidence and techniques of analysis appropriate to the topics selected. In addition to reading examples of research on Africa, and on the African Diaspora in Europe, Asia, Latin America, and the Caribbean, students usually develop their own research projects.

AFRS 3410. Religion and Spirituality in the African Diaspora. 4 Hours.
Examines religious thought and rituals and the Diaspora in a comparative context. Topics include traditional religions, Islam, Christianity, and Judaism in Africa, and the Diaspora. Emphasizes the transformation of religions practiced in Africa when African captives were forced into the three slave trades affecting the continent of Africa: trans-Saharan, Indian Ocean, and transatlantic.

AFRS 3424. Epidemiology of Pandemic Diseases and Health Disparities in the African Diaspora. 4 Hours.
Examines the epidemiology and determinants of diseases and the public health practice among continental African peoples and African-derived populations in the Americas and elsewhere in the African Diaspora. Emphasizes such epidemic diseases as malaria, yellow fever, tuberculosis, smallpox, the current AIDS pandemic, obesity, and cancer. The course also aims to critically address the breadth of factors behind these pandemics, such as socioeconomic, political, health system, behavioral, and genetic. A cross-cutting theme throughout the course is the entrenched health disparities in society.

AFRS 3428. African Languages. 4 Hours.
Seeks to prepare students for serious theoretical and practical study of the West African language and literature known as Kwa, the largest language subgroup in the Niger-Congo family. Explores the classification of African languages, the application of basic linguistics, and the history of these languages in Africa and the Western hemisphere, all leading to an introduction to spoken Yoruba and Igbo.

AFRS 3460. Contemporary Government and Politics in Africa. 4 Hours.

AFRS 3464. Natural Resources and Sustainable Development. 4 Hours.
Examines the social dimensions of resource extraction. Focusing mainly on developing nations, studies global issues, including developments in industrial nations, to assess their impact on resource extraction and living and working conditions in resource-rich regions. Uses case studies of key countries producing oil/gas, minerals, and forest/agricultural commodities to illustrate the past/current causes of resource mismanagement; their social consequences; and how public policies, legislation, and financial and human resource management with industrialization can be used to avert or reduce the adverse effects of resource extraction, especially in poor countries.
AFRS 3467. Diaspora in Motion: Contemporary African and Caribbean Migration. 4 Hours.
Offers an introduction to the contemporary international migration of African and Caribbean people to North American and European countries. Emphasizes a sociological understanding of contemporary international migration, while drawing knowledge from multiple disciplines that influence the study of international migration. Focuses on these migrants’ social position as Black, foreign-born persons in contemporary Western societies. Introduces key topics, debates, categories, concepts, and theories of international migration and immigrant assimilation. Offers students an opportunity to read empirical research on Black African and Caribbean migrants in the United States, Canada, England, and France and to research African and Caribbean immigrants in Boston.

AFRS 3470. Identity and Nationalism in Africa. 4 Hours.
Studies how centuries of imperialism, the struggle for national unity, and the continuing problems of racism and rivalry between factions have affected the present identities and nationalist movements in Africa. Explores problems peculiar to Africa and to any group of nations struggling against colonial ideas. Tribalism and the effects of European colonial partition on African identity are discussed.

AFRS 3645. National Model African Union. 4 Hours.
Offers students the opportunity to participate in teams and conduct research on political issues in assigned nations and then represent those nations in a model African Union role-playing exercise in Washington, D.C. Focuses on intra-African relations and the roles of Africans in international affairs, emphasizing the new African Union (AU) that replaced the Organization of African Unity (OAU). Examines the Pan-Africanist origins, challenges, and achievements of the African Union.

AFRS 4500. Arts of the African Diaspora. 4 Hours.
Traces the historical development of the art forms and production practices of the African Diaspora, from traditional to contemporary styles in Africa, the Americas, and elsewhere in the African Diaspora. Emphasizes the study of art objects, the historical and social context in which aesthetic issues are shaped, and the impact of religion and external forces on creativity. Uses lectures, critiques, discussions, fieldwork, and hands-on interaction with art objects.

AFRS 4585. Current Issues in the African Diaspora. 4 Hours.
Introduces students to present-day issues and problems that confront various segments of the worldwide African Diaspora. Includes the social, political, and economic aspects of the experiences of Africans in the Diaspora. Students are asked to assess the validity of several social theories in relation to the African Diaspora.

AFRS 4690. Topics in African History. 4 Hours.
Covers special topics in African history. May be repeated without limit.

AFRS 4939. Community Health, Culture, and Development in Kenya. 4 Hours.
Introduces the community health and development arena in Kenya. Community development has been presented as the panacea to many of Africa’s problems, including leadership, democracy, conflict, disease, and poverty. Through teaching, research, and action, the course seeks to expose and sensitize students to the global and local debate on poverty, primary healthcare, and community development. Offers students an opportunity to gain hands-on experiences in some of the major determinants and solutions to poverty and disease by interacting with community stakeholders and organizations in a variety of cultural, rural, and urban settings and through visits to, and participating in, projects run by community-based organizations.

AFRS 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

AFRS 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

AFRS 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

AFRS 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

AFRS 4994. Internship. 4 Hours.
Offers students an opportunity for internship work. May be repeated without limit.

AFRS 4996. Experiential Education Directed Study. 4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. May be repeated without limit.

African-American Studies (AFAM)

AFAM 1101. Introduction to African-American Studies. 4 Hours.
Explores several of the possible historical, sociological, cultural, and political avenues of study in the broad interdisciplinary spectrum of African-American studies. Provides an introductory overview of the field and offers an opportunity to identify areas for more specific focus.

AFAM 1102. Research and Writing in the African Diaspora 1. 4 Hours.
Introduces students to academic research, college-level writing techniques, and scholarly inquiry. Offers students an opportunity to develop critical-thinking skills. Focuses on the interpretation and analysis of current events and the diverse topics and scholarly texts of the African Diaspora through writing. Emphasizes identifying patterns of organization, providing supporting evidence, documenting sources, and practicing editing techniques and the process of revisions. Requires students to produce multiple written drafts to build a comprehensive writing portfolio.

AFAM 1103. Research and Writing in the African Diaspora 2. 4 Hours.
Designed to expand students’ grasp of diverse styles and genres of writing from among the African Diaspora. Explores fiction, nonfiction, and writing for multimedia. Expands upon the analysis and interpretation of scholarly texts, with a particular focus on the interpretation and analysis of literature of the African Diaspora through writing. Offers students an opportunity to expand their writing portfolio as well as deliver oral presentations. Requires students to develop original, qualitative research through a semester-long research project.

AFAM 1104. The African-American Experience through Music. 4 Hours.
Explores the various musical traditions of African Americans, with a specific focus on the United States. Examines the impact of African, European, and Native American traditions on African-American music as well as the role of music as an expression of African-American aesthetics, traditions, and life. Considers historical and contemporary forms of African-American music, with selected video presentations. Not open to students who have taken MUSC 1104.

AFAM 1109. Foundations of Black Culture 1. 4 Hours.
Studies music, literature, visual and performing arts, and other cultural and artistic traditions as they have evolved among African, African-American, and Caribbean peoples.
AFAM 1113. Black Popular Culture: Music, Movies, and More. 4 Hours.
Surveys Black popular culture from the mid-1950s to the present through music, movies, music videos, and other forms of multimedia, paying close attention to social commentary, political critique, economic inference, cultural formation, explications of religious and spiritual beliefs, and the like. Issues of representation, identity, values, and aesthetics are pondered and discussed. Seeks to cause students to rethink and reexamine the intent and impact of Black popular culture as a method and means of expression and communication.

AFAM 1135. John Coltrane and Black America’s Quest for Freedom. 4 Hours.
Studies the life of John Coltrane, one of the greatest musicians of all time. Presents his growing up in a Black North Carolina community during the era of U.S. apartheid to becoming a world-class artist whose music touched listeners around the globe and continues to be a major influence in current times. His advanced and innovative conceptions (melodic, rhythmic, and harmonic) and stylistic contributions to African-American creative improvisation changed the way to play the music forever. Emphasizes his immense impact on jazz and other improvisational music and expressive art forms, as well as his spiritual legacy, which focused on using music for the improvement of humanity. Not open to students who have taken MUSC 1135.

AFAM 1140. Introduction to African-American History. 4 Hours.
Surveys the development of African Americans in the United States from their African background to the present. Covers medieval and early modern societies in West and Central Africa; the transatlantic slave trade; the evolution of slavery from the colonial period through the Civil War; free blacks; Reconstruction; migration; civil rights; and black nationalism. Considers gender relations throughout the entire period and emphasizes how an historical perspective helps to inform discussions of contemporary issues.

AFAM 1220. African-American Theatre. 4 Hours.
Surveys the history of African-American theatre artists in the United States from the time of Ira Aldridge to the present day. Also examines the works of African-American playwrights from the Harlem Renaissance to the present, with an emphasis on the period beginning with Baraka’s *Dutchman*.

AFAM 1225. Gender, Race, and Medicine. 4 Hours.
Examines the basic tenets of “scientific objectivity” and foundational scientific ideas about race, sex, and gender and what these have meant for marginalized groups in society, particularly when they seek medical care. Introduces feminist science theories ranging from linguistic metaphors of the immune system, to the medicalization of race, to critiques of the sexual binary. Emphasizes contemporary as well as historical moments to trace the evolution of “scientific truth” and its impact on the U.S. cultural landscape. Offers students an opportunity to develop the skills to critically question what they “know” about science and the scientific process and revisit their disciplinary training as a site for critical analysis. AFAM 1225, HIST 1225, and WMNS 1225 are cross-listed.

AFAM 1270. Economic Status of Ethnic Minorities. 4 Hours.
Examines the economic conditions and processes as they impact minorities within the U.S. economy. Considers the role of national economic policies undertaken to address general economic and social conditions, as well as policies targeted at minority markets and institutions. Emphasis is on empirical analysis; historical and cultural materials may be incorporated.

AFAM 1300. The African-American Experience through Short Fiction and Black Cinema. 4 Hours.
Surveys the expressions of African-Americans through the lens of short fiction and black cinema. Engages both the traditional and contemporary forms of cultural expression, grounding the lineages through numerous African forms, contributions from the West and Far East, and looking toward futuristic engagement.

AFAM 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

AFAM 2301. Foundations of Black Culture 2. 4 Hours.
Continues AFAM 1109. Provides an interdisciplinary approach to the cultural production of African-based traditions in the Americas and elsewhere in the African Diaspora. Forms of cultural production include film, theatre, the visual arts, literary arts, and dance. While several issues in theory and practice in the arts are discussed, emphasis is on the ways in which an African-based tradition is rooted in the intellectual and cultural histories of African descendants in the United States, the Caribbean, South and Central America, and Great Britain.

AFAM 2312. Black History of Boston. 4 Hours.
Examines the social, economic, political, and educational history of Boston’s black community in the nineteenth and twentieth centuries. The development of the black community and its institutions is a major focus, and students are encouraged to study the past in an attempt to understand the present and interpret the future. Research data include participant observation, oral history, interviews, and primary and secondary source materials.

AFAM 2320. The Black Family. 4 Hours.
Studies how the black family functions, both interpersonally and as a social unit. Anthropological and sociological theories deal with variations in family structure and the function of the black family in black society. The effects of slavery and colonization on the black family structure and functions are also explored. Discusses some of the differences and similarities between African, African-American, and African-Caribbean families.

AFAM 2325. African-American Women. 4 Hours.
Examines themes and topics in the history of African-American women using an interdisciplinary approach. Themes and topics include women’s lives in precolonial Africa, their role in the transatlantic slave trade, women and American slavery, community and institution building after Emancipation, black women and labor, stereotypes of black women, black women and civil rights, and black women today.

AFAM 2337. African-American History before 1900. 4 Hours.
Covers the development of black America from slavery through the Booker T. Washington-W. E. B. DuBois controversy, with emphasis on the historical links between Africa and America that have shaped the African-American experience. Includes in-depth discussion of slavery’s impact, the role of the antebellum free black, the Civil War and Reconstruction, and the black response to the new racism of the late nineteenth century.

AFAM 2338. African-American History since 1900. 4 Hours.
Examines the modern development of black America, with major emphasis on the twentieth century and the rising tide of African-American nationalism. Provides an historical perspective regarding key contemporary issues including the founding of the National Association for the Advancement of Colored People (NAACP), the Marcus Garvey back-to-Africa movement, the Harlem Renaissance, the Black Muslims, the impact of Martin Luther King, Jr., and the idea of Black Power.
AFAM 2339. Analysis of American Racism. 4 Hours.
Discusses the cycle by which racism in our institutions helps form our attitudes and the manner in which our attitudes, in turn, shape our institutions. Emphasizes the practical, day-to-day aspects of racism, rather than the theoretical and historical.

AFAM 2344. Contemporary Black Politics. 4 Hours.
Analyzes the evolution of black political thought in the United States and examines the sociopolitical contexts that have served as catalysts to modern black political movements.

AFAM 2345. The Black Experience in the Caribbean. 4 Hours.
Offers a descriptive and interpretive analysis of the growth of the modern black community in the Caribbean. Although the focus is the contemporary period, the course examines that period in the context of colonialism and slavery in the Americas. Important racial, social, political, economic, and religious issues are addressed.

AFAM 2350. History of Blacks in the Media and the Press. 4 Hours.
Offers a historical and visual examination of the development of the African-American experience in the U.S. mass media and press. Analyzes contemporary and historical literature, films, and people with respect to history, racism, images, psychology, and social movements. Newspapers, film, television, and radio are prime focal points, and are used to help form strategies for the future of black Americans.

AFAM 2360. Politics of Poverty. 4 Hours.
Explores how and why there is poverty, how it affects people's lives, and how it can be eliminated. Examines the relations between poverty, racial and ethnic factors, and the economic, political, and administrative systems. Evaluates a number of alternatives and provides an opportunity for clarifying individual assumptions and feelings about poverty.

AFAM 2365. Blacks and Jews. 4 Hours.
Compares the black and Jewish experiences in the United States. Themes include remembered slavery and commemoration of freedom; Holocaust and genocide; religious expressions of politics; black-Jewish relations; and black Judaism.

AFAM 2367. Race and Social Identity. 4 Hours.
Provides an interdisciplinary look at the social, political, and psychological factors shaping contemporary African-American identity. Explores several different factors that interact with blackness to shape the diversity of African-American experience, such as skin color, gender, and class. Studies black identity as it has been conceptualized, measured, and researched by psychologists. Readings include essays written by important African-American thinkers, fiction, and autobiographical narratives, as well as empirical research in the field of psychology.

AFAM 2399. Black Community and Social Change. 4 Hours.
Explores the dynamic changes experienced by black communities in the United States since the civil rights era in the 1950s and 1960s. Includes discussions and applications of key concepts and methods in several fields of the social sciences, and seeks to understand the relationship of race, class, gender, and social change in addressing the current search for policies and programs for community development.

AFAM 2455. American Women Writers. 4 Hours.
Surveys the diversity of American women's writing to ask what it means to describe writers as disparate as Phillis Wheatley, Edith Wharton, Toni Morrison, and Alison Bechdel as part of the same "tradition." With attention to all genres of American women’s writing, introduces issues of genre and gender; literary identification; canons, the politics of recuperation, silence and masquerade; gender and sexuality; intersectionality; sexual and literary politics, compulsory heterosexuality, and more. AFAM 2455, ENGL 2455, and WMNS 2455 are cross-listed.

AFAM 2549. Public Policy and Black America. 4 Hours.
Examines the impact of public policy on African Americans and the role of African Americans in the formulation of public policy. These roles include protest, interest-group politics, electoral politics, and blacks as policy researchers and advisers. The process of public policy formulation as it affects blacks is explored through a series of case studies ranging from the formulation and enforcement of fugitive slave laws in the pre–Civil War era to strategic military and foreign policy, affirmative action, welfare reform, and reparations in our own time.

AFAM 2600. Contemporary Issues: Race, Science, and Technology. 4 Hours.
Examines the social impact of diverse forms of technological development and application that will have sweeping effects on the everyday lives of individuals, groups, governments, and societies in the twenty-first century. The global, transforming effects of technology as it affects communities of color in the United States and internationally are explored in three main areas: the computer, DNA, and quantum revolutions. Topics include the digital divide, minority media ownership, human cloning, the "dot.com" phenomenon, race and cultural representations in cyberspace, and biopiracy. Lectures, class discussions, fieldwork, and interaction with leaders in these various fields are integral elements of the course.

AFAM 2639. Globalism, Racism, and Human Rights. 4 Hours.
Explores the historical stages of globalization as a geopolitical and social phenomenon having significant impact on social change. Focuses on multiple effects of racism and the gradual emergence of human rights as an extension of basic freedoms internationally. Topics and themes include the African and Latino Diaspora, North-South debates, gender, Third World countries, democratization, poverty, healthcare/pandemic disease, censorship, political repression, new development strategies, and the role of the United Nations and other international organizations in increasingly complex societies.

AFAM 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

AFAM 2991. Research Practicum. 2-4 Hours.
Involves students in collaborative research under the supervision of a faculty member. Offers students an opportunity to learn basic research methods in the discipline. Requires permission of instructor. May be repeated once for up to 4 total credits.

AFAM 3402. African-American English. 4 Hours.
Addresses topics in the study of African-American English or Ebonics. Investigates the hypotheses about the origins of African-American English as well as arguments about the relationship of the dialect to English and other languages. Considers issues regarding the use of the dialect in schools.

AFAM 3422. Blacks in Science and Medicine. 4 Hours.
Studies the contributions that African Americans have made to the development of science and technology in America. Examines the cultural and social factors that have encouraged blacks to work in the fields of science (biology, chemistry, physics, and medicine) and technology (engineering). Certification of blacks within the U.S. scientific community and the availability of science to the past and contemporary African-American communities are also explored. Uses readings, discussions, individual research topics, and interviews with black scientists, inventors/engineers, and doctors.
AFAM 3441. Third World Political Relations. 4 Hours.
Offers a comparative regional analysis of the political systems of Third World nations of Africa, Asia, Latin America, and the Caribbean. Emphasis is on development strategies; problems of development, including national identity, political socialization and participation, national defense, and urbanization; and the positions of Third World nations in the international community.

AFAM 3454. Black Elderly in the Americas. 4 Hours.
Examines in historical context the economic, healthcare, and cultural issues surrounding the aging process among blacks in the Americas, with emphasis on the United States. Identifies the treatment of elders in traditional African societies, major diseases with differential incidence among the black elderly (such as cardiovascular disease and diabetes), racial health disparities, and institutions that African Americans have developed to cope with the conditions of elderly blacks.

AFAM 3458. Labor, Unions, and Work in Black Society. 4 Hours.
Focuses on the nature and meaning of work in black society in the United States, especially the interface between black workers and organized labor. Explores the long-term exclusion of black workers from many unions affiliated with the American Federation of Labor (AF of L) in the late nineteenth and early twentieth centuries; the efforts of industrial unions affiliated with the Congress of Industrial Organizations (CIO); the rise of such black unions as the Brotherhood of Sleeping Car Porters; and more recent efforts to organize public employees.

AFAM 3485. Education Issues in the Black Community. 4 Hours.
Focuses on some of the important issues in today's urban elementary and secondary education systems. Examines the historical development of these issues, and students are encouraged to think about and discuss the issues' future significance.

AFAM 3653. The Black Novel. 4 Hours.
Focuses on the black novelist's place in the history of American fiction. Emphasis is given to Chesnutt, Toomer, Wright, Ellison, and contemporary novelists, and to their different perceptions of the black experience in America.

AFAM 3664. Black Poetry and the Spoken Word. 4 Hours.
Focuses on the black poet's place in the history of American poetry. Considers black poetry as both written words and spoken words.

AFAM 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

AFAM 4501. Contemporary Issues: Hip-Hop Culture. 4 Hours.
Surveys the global impact of hip-hop culture on a new generation of young people. Begun in the 1970s and 1980s in the United States as a cross-cultural expression of black and Puerto Rican traditions, it has become a major force worldwide. Using an interdisciplinary and practice-oriented approach, addresses such issues as youth identity formation, the role of women and gender in rap music, and the use of novel expressive forms. The combination of fieldwork and weekly critiques on contemporary public debates (such as censorship and the U.S. Constitution, violence and aggression, and sexism and misogyny) yield a final document to be presented to the University community and to be deposited in the Twenty-First Century Hip-Hop Library and Archive Project.

AFAM 4507. Afro-Cuban Culture—International Study. 4 Hours.
Offers students an opportunity to obtain fundamental knowledge of the legacy of African-based cultures in Cuba, from historical to contemporary times. Examines origins of Africans in Cuba, including study of plantation culture, transculturation, African-derived religions, the visual arts, music literature, images of blacks in film and the mass media, and African-derived culture in Cuban daily life. Also includes visits to temples and other ritual spaces, meetings with writers, encounters with artistic troupes, meetings with priests or priestesses, visits to cultural organizations, and possible participation in rituals or ceremonies (tambor, cajón, violin).

AFAM 4533. Field Research Seminar. 4 Hours.
Enables advanced students to design and execute research studies in the field utilizing such methods as community surveys, courtroom observation, archival research, archaeological excavation, and participant observation. Includes performance studies.

AFAM 4544. Seminar in Black Leadership. 4 Hours.
Enables students to conduct in-depth studies of significant black leaders-male and female-in a wide range of fields. Focuses on black leadership in the political arena as elected officials, leaders of pressure groups, leaders of protest organizations, black nationalist organizations, and feminist/womanist groups, and as advisers to political parties and presidential administrations.

AFAM 4588. Literature in Context. 4 Hours.
Places writers in the context of a special theme; for example, students might discuss a group of writers influenced by their common interest in psychoanalysis, by the social consciousness, or by an interest in the settlement of America.

AFAM 4618. Laboratory in Community Psychology. 4 Hours.
Familiarizes students with some of the research methods employed by psychologists and other scientists working in the area of community psychology. Community psychologists study people in their social contexts, with emphasis on the mutual influences that individuals and communities have upon each other. Rather than attempt to understand and treat problems at the individual level, research in community psychology aims to offer practical solutions to social problems, focusing on prevention. Familiarizes students with a particular community, which they utilize for data collection. Students develop survey instruments/interview schedules, collect data, and analyze and interpret the findings with a qualitative design if possible.

AFAM 4640. Topics in African-American History. 4 Hours.
Covers special topics in African-American history. May be repeated without limit.

AFAM 4642. Topics in African-American Art History. 4 Hours.
Explores special topics in African-American art history in this advanced seminar. May be repeated without limit.

AFAM 4663. Early African-American Literature. 4 Hours.
Surveys the development and range of black American writers, emphasizing poetry and prose from early colonial times to the Civil War.

AFAM 4670. Modern African-American Literature. 4 Hours.
Surveys the development and range of black American writers in poetry and prose from the post-Civil War period to the present.

AFAM 4700. Advanced Seminar. 4 Hours.
Offers students the opportunity to prepare a professional research paper under the close supervision of a scholar interested in students' particular research areas. The senior thesis is required of all African-American studies majors. Fulfills experiential education requirement.
AFAM 4710. Field and Lab Methods for Researching Afro-Caribbean Music. 4 Hours.
Designed to provide students with principles and practices of ethnomusicological field techniques and research focused on selected African-based music cultures throughout the Caribbean. Offers students an opportunity to obtain a firm foundation so that they may be able to explore research in various genres, forms, and styles of Black music across the globe. Combines theory and practice in an experiential course. May be repeated without limit.

AFAM 4900. Seminar: Authors in the African Diaspora. 4 Hours.
Enables students to conduct in-depth studies of significant bodies of work—both fiction and nonfiction—by individual authors of the African Diaspora such as Chinua Achebe, W. E. B. DuBois, Toni Morrison, Richard Wright, Zora Neale Hurston, Frantz Fanon, and Leopold Senghor. May be repeated without limit.

AFAM 4939. Afro-Caribbean Music Research. 4 Hours.
Examines the highly diverse and unique African-based music cultures of the Caribbean. Exposes students to musical repertories, ideas about music, relationship of music to culture, musical instruments, musical contexts, musicians, dancers, and musical syncretism. Examines the roles and functions of music within human life. Taught as part of the Afro-Caribbean Music Research Project while in the field in various Caribbean contexts and takes advantage of firsthand aspects of the specific music culture being studied. Activities include study of historical and contemporary musical history of the Caribbean as well as applied ethnomusicological field research methods, techniques, approaches, and procedures. May be repeated without limit.

AFAM 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

AFAM 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

AFAM 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

AFAM 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

AFAM 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

AFAM 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

AFAM 4994. Internship. 4 Hours.
Offers students an opportunity for internship work. May be repeated without limit.

AFAM 4995. AAMARP Practicum. 4 Hours.
Offers students mentoring by artists-in-residence at the African-American Master Artists in Residency Program (AAMARP). Students gain hands-on studio experience mainly in the graphic and visual arts and in the preparation and management of artistic exhibitions mounted at the AAMARP gallery and other local and regional venues where AAMARP artists exhibit their work. May be repeated without limit.

AFAM 4996. Experiential Education Directed Study. 4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. May be repeated without limit.

Air Force ROTC (AIRF)

AIRF 1110. Foundations of the U.S. Air Force 1. 1 Hour.
Examines the role of the United States Air Force in the contemporary world. Surveys background, mission, and organization of the Air Force and functions of United States strategic forces. Also emphasizes development of written nonfictional communication skills.

AIRF 1111. Leadership Laboratory 1. 0 Hours.
Introduces the customs, traditions, and courtesies of the Air Force through guest speakers, seminars, and a field trip to an Air Force base.

AIRF 1120. Foundations of the U.S. Air Force 2. 1 Hour.
Continues study of the contemporary Air Force by examining general-purpose forces, aerospace support forces, and the total force structure.

AIRF 1121. Leadership Laboratory 2. 0 Hours.
Continues AIRF 1111. Emphasizes the role and responsibilities of an Air Force company grade officer.

AIRF 1210. Evolution of U.S. Air Force Air and Space Power 1. 1 Hour.
Traces the historical development of air power and its uses starting before the Wright brothers and extending through the Korean War. Concentrates on the advent of the air age, the airplane at war (1914-1918), the interwar years, air power in World War II, the Berlin Airlift, air-power in the Korean War, and the evolution of air power concepts and doctrine. Emphasizes student participation and presentations to enhance communication skills.

AIRF 1220. Evolution of U.S. Air Force Air and Space Power 2. 1 Hour.
Traces the historical development of air power and its uses starting after the Korean War and continuing through its present role in international policies. Emphasizes experiences from the Vietnam conflict and Operations Desert Shield and Desert Storm. Continues emphasis upon student participation and presentations to enhance communication skills.

AIRF 2211. Leadership Laboratory 3. 0 Hours.
Emphasizes development of techniques used to direct and inform. Assigns students to leadership and management positions in the AIRF 1111 programs previously described.

AIRF 2221. Leadership Laboratory 4. 0 Hours.
Continues AIRF 2211. Adds a special program in preparation for field training.

AIRF 2310. U.S. Air Force Leadership Studies 1. 3 Hours.
Examines management and leadership from the point of view of the Air Force junior officer. Covers the individual motivational and behavioral processes, leadership, communication, and group dynamics to provide a foundation for the development of the junior officer’s professional skills as an Air Force officer.

AIRF 2320. U.S. Air Force Leadership Studies 2. 3 Hours.
Continues AIRF 2310. Offers special emphasis on the basic managerial processes that involve decision making, and the use of analytical aid in planning, organizing, and controlling in a changing environment. Discusses organizational and personal values, management of forces in change, organizational power, politics, and managerial strategy and tactics in the context of the military organization. Uses actual Air Force cases to enhance the learning and communication processes.
AIRF 3311. Leadership Laboratory 5. 0 Hours.
Focuses on exercise of management functions in planning, supervising, and directing cadet group activities. Provides students the opportunity to acquire proficiency in military leadership skills.

AIRF 3321. Leadership Laboratory 6. 0 Hours.
Continues AIRF 3311. Offers students the opportunity to prepare themselves for professional duties.

AIRF 3410. National Security Affairs. 3 Hours.
Studies the role of the military in maintaining the security of the United States. Examines the international environment, the background of defense policy, strategy, and forms of conflict. Addresses specific issues including weapons acquisition, arms control, nuclear deterrence, and the national military decision-making process. Emphasizes developing communication skills through student presentations.

AIRF 3420. Preparation for Active Duty. 3 Hours.
Studies the military’s role as an institution in a democratic society. Topics include civil-military interaction and the military as a profession. Emphasizes developing communication skills through student presentations.

AIRF 4411. Leadership Laboratory 7. 0 Hours.
Provides supervisory practice and exercise of leadership functions in controlling and directing activities of the cadet group. Develops leadership potential in a practical, supervised training lab.

AIRF 4421. Leadership Laboratory 8. 0 Hours.
Continues AIRF 4411. Emphasizes supervisory and leadership skills. Discusses advantages of an Air Force career.

American Sign Language (AMSL)

AMSL 1101. Elementary ASL 1. 4 Hours.
Introduces students to American Sign Language (ASL). Students develop expressive and receptive competence in using ASL to fulfill various social functions (such as introductions, explanations of personal history, and descriptions of simple narratives). Additional topics include the use of signing space and further use of nonmanual components including facial expression and body postures.

AMSL 1102. Elementary ASL 2. 4 Hours.
Continues AMSL 1101. Continues development of expressive and receptive competence in using American Sign Language to fulfill various social functions (such as introductions, explanations of personal history, and descriptions of simple narratives). Emphasizes further development of receptive and expressive skills, finger spelling, vocabulary building, grammatical structures; encourages more extensive use of nonmanual behaviors, classifiers, body postures, and signing space. Students are also introduced to regional and ethnic sign variations and political and educational institutions of the Deaf community.

AMSL 1401. Elementary ASL 1 for Healthcare Professionals. 4 Hours.
Focuses on the development of basic conversational skills using a variety of conversational strategies in ASL. This is the first course in a sequence of American Sign Language (ASL) courses offered for students in the Bouvé College of Health Sciences at Northeastern University. ASL is the primary sign language of the Deaf community throughout the United States and much of Canada. Addresses those conversational skills most often used in medical settings. Emphasizes basic rules of grammar, finger spelling, and cultural behaviors of the Deaf community, as well as the ASL vocabulary and phrases needed for a variety of medical situations. Guest speakers share their experiences in various medical settings.

AMSL 1402. Elementary ASL 2 for Healthcare Professionals. 4 Hours.
Continues AMSL 1401 or AMSL 1101. Offers students an opportunity to continue to develop the conversational skills used in medical settings. Constitutes the second course in a sequence of American Sign Language (ASL) courses designed for students in the Bouvé College of Health Sciences and in the premed program. Emphasizes further development of receptive and expressive skills, finger spelling, vocabulary building, and grammatical structures.

AMSL 1511. ASL Classifiers. 4 Hours.
Seeks to improve understanding of and use of ASL classifiers, including appropriate nonmanual grammatical features and other nonmanual markers. Discusses classifier hand shapes and how movement, location, and orientation of classifiers affect meaning in ASL. Covers eight types of ASL classifiers: semantic, instrumental, descriptive, locative, plural, body part, sport, and elemental. Offers students an opportunity to build on existing classifier vocabulary and eventually use an expanded range of classifiers to express narratives.

AMSL 1512. ASL Numbers and Fingerspelling. 4 Hours.
Offers students an opportunity to improve receptive and expressive skills in the specific areas of fingerspelling and numbers. Includes a brief history of fingerspelling. Focuses on strategies for understanding fingerspelling/word phrases and number recognition; recognizing number patterns (e.g., ordinal and cardinal numbers, height, age, time); and additional strategies for understanding and using numbers and fingerspelling in context. Uses drills to improve speed, clarity, and fluency skills.

AMSL 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

AMSL 2101. Intermediate ASL 1. 4 Hours.
Continues the student’s development of expressive and receptive competence in using American Sign Language to fulfill various communicative functions, such as making and responding to inquiries, constructing and comprehending narratives, and engaging in debates. Students also continue to expand their ASL lexicon.

AMSL 2102. Intermediate ASL 2. 4 Hours.
Continues AMSL 2101. Emphasizes further development of receptive and expressive skills, finger spelling, vocabulary building, grammatical structures; encourages more extensive use of nonmanual behaviors, classifiers, body postures, and signing space. Continues exposure to regional and ethnic sign variations and political and educational institutions of Deaf people. Offers intensive practice involving expressive and receptive skills in storytelling and dialogue. Introduces language forms used in American Sign Language poetry and the features of culture as they are displayed in art.

AMSL 2900. Specialized Instruction in ASL. 1-4 Hours.
Designed for individuals whose language skills are at the intermediate level and who seek specially focused language instruction. Such instruction might be the use of the language in specific settings (e.g., media, medical, legal, mental health), or it might be focused on specific conversational nuances of the language. May be repeated without limit.

AMSL 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

AMSL 3101. Advanced ASL 1. 4 Hours.
Focuses on continued development of syntactic competence in American Sign Language with particular attention to the use of ASL in formal discourse. Also focuses on lexical semantics and semantic equivalents for multiple meaning English lexical items.
AMSL 3102. Advanced ASL. 2. 4 Hours.
Continues AMSL 3101. Focuses on further development and refinement of American Sign Language competence in various discourse settings, predominantly formal and consultative. Continues development of lexical semantics and uses individual diagnostic assessment of ASL competence to determine individual competency goals.

AMSL 3900. Specialized Instruction in ASL. 1-4 Hours.
Designed for individuals whose language skills are at the advanced level and who seek specially focused language instruction. Such instruction might be the use of the language in specific settings (e.g., media, medical, legal, mental health), or it might be focused on specific conversational nuances of the language. May be repeated without limit.

AMSL 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

AMSL 4900. Specialized Instruction in ASL. 1-4 Hours.
Designed for individuals whose language skills are at the advanced level and who seek specially focused language instruction. Such instruction might be the use of the language in specific settings (e.g., media, medical, legal, mental health), or it might be focused on specific conversational nuances of the language. May be repeated without limit.

AMSL 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

AMSL 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

AMSL 4992. Directed Study. 1-4 Hours.
Offers students a way of going beyond work given in the regular curriculum; may also enable students to complete major requirements in certain situations. Priority is given to American Sign Language majors and to juniors and seniors. May be repeated without limit.

AMSL 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

AMSL 5901. Gallaudet University Program. 20 Hours.
Offers students an opportunity to study at an officially bilingual university, with American Sign Language and English used for instruction and by the university.

AMSL 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

AMSL 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

AMSL 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

AMSL 6978. Independent Study. 1-4 Hours.
Offers an opportunity to conduct research under the direction of members of the department on a chosen topic.

AMSL 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

AMSL 6210. Foundations in Teaching Meaning Transfer: Translation. 4 Hours.
Explores theories and trends in discourse-based meaning transfer for interpreting and teaching translation and consecutive interpreting. Offers students the opportunity to design and prepare one or more teaching units that incorporate reflective teaching practices related to translation and consecutive interpreting.

AMSL 6215. Time-Shifted Meaning Transfer. 3 Hours.
Builds on the work of ASL 6210. Offers students an opportunity to design, prepare, and present teaching units that incorporate reflective teaching practices related to translation and consecutive interpreting. Also offers students an opportunity to “teach” their units, either to each other or to the attending students, to begin work on their capstone portfolios, and to observe instructors during the symposium.

AMSL 6217. Introduction to Interpreting in Video Settings. 4 Hours.
Offers the first known academic treatment of this unique interpreting venue. Discusses the history, theory, practice, and ethos of video interpreting. Course topics include the history of interpreting via telecommunications, ethical considerations in video interpreting, models of video interpreting, future directions, and insights from the industry.

AMSL 6310. Research Foundations for Teaching Second Languages. 3 Hours.
Explores current research in teaching second languages and interpreting, with a focus on discourse analysis in ASL/English. Emphasizes approaches to understanding and presenting/explaining qualitative and quantitative research.

AMSL 6320. Assessment Approaches in Teaching Interpreting. 3 Hours.
Offers students an opportunity to explore and apply theories and approaches of assessment in teaching interpreting. Includes authentic assessment, diagnostics, feedback, and self-assessment.

AMSL 6325. Ethical and Professional Foundations. 3,4 Hours.
Explores approaches to teaching interpreting content courses, including such topics as preparing professional and ethical practitioners, topics and settings in interpreting, issues in the field of interpreting, and other content-related topics. Offers students an opportunity to design and prepare teaching units (workshops, modules, courses) that incorporate reflective teaching practices and to apply action research practices in their work.

AMSL 6330. Real-Time Meaning Transfer. 3 Hours.
Offers students an opportunity to explore and synthesize the various approaches for teaching interpreting that culminate in skills for successful simultaneous interpreting in a variety of discourse styles. Incorporates reflective practices, assessment, and action research into these activities and topics and combines this study with preparation for ASL 6966.
ASL 6332. Program Assessment for Language Learning. 3 Hours.
Designed specifically for students interested in teaching world languages and interpreting. Program assessment is critical to quality assurance and continuous improvement. Mechanisms that demonstrate value added are also important to organizations that sponsor training and development efforts. Offers students an opportunity to learn how to establish goals based on measurable outcomes, how to set benchmarks for performance measurement, and how to demonstrate the impact of a program on an organization's bottom line. Examines issues related to accreditation and other academic program reviews.

ASL 6835. Foundations of Action Research. 3 Hours.
Seeks to guide students in the theory and reflective practice of applied action research in their work as educators and interpreters. Offers students an opportunity to prepare for the teaching practicum experience by exploring and ultimately designing an action-research project to be carried out during the practicum.

ASL 6961. Internship. 1-4 Hours.
Implements a supervised mentoring project designed in ASL 6102. Offers students the opportunity to apply knowledge and skills acquired and to integrate them with real-world experiences in mentoring. May be repeated without limit.

ASL 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ASL 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

ASL 6966. Practicum. 3,4 Hours.
Offers students an opportunity to apply and practice reflective teaching in courses, workshops, and other educational settings.

ASL 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

ASL 6980. Capstone. 1-4 Hours.
Offers the opportunity to finalize their capstone portfolios, which includes demonstrating the mastery of teaching competencies and research methodologies. The course culminates with a defense before faculty and other reviewers.

ASL 6983. Topics. 1-4 Hours.
Covers special topics in American Sign Language. May be repeated without limit.

ASL 6995. Project. 1-4 Hours.
Focuses on an in-depth project in which a student conducts research or produces a product related to the student's major field. May be repeated without limit.

ALY 6000. Introduction to Analytics. 3 Hours.
Offers an overview of analytics concepts and practices across a diverse range of industries and organizational contexts. Case studies of successful analytics initiatives from fields including retail, government, education, and the arts provide opportunities to examine how the collection and analysis of data impacts decision making within a variety of contexts. Offers students an opportunity to engage with the current theories, practices, and debates in the field of analytics to critically examine its practice. Distinctions among specific analytical techniques and tools, including the use of Excel for fundamental data analysis methods, provide context essential to preparing students to engage more deeply with the individual courses that follow.

ALY 6010. Probability Theory and Introductory Statistics. 3 Hours.
Introduces statistics for business analytics from an analysis-of-data viewpoint. Topics include frequency distributions; measures of location; mean, median, mode; measures of dispersion; variance; graphic presentation; elementary probability; populations and samples; sampling distributions; categorical data; regression and correlation; and analysis of variance. Explores the use of statistical software in data analysis. Lab sessions emphasize hands-on application of probability and statistics in Excel and data problem solving with advanced Excel techniques.

ALY 6015. Intermediate Analytics. 3 Hours.
Builds on the foundation laid in ALY 6000 and ALY 6010 by introducing fundamental data due diligence, data correction and recoding processes and practices, in addition to expanding upon the earlier introduced approaches to discerning and validating patterns in data through sound applications of the scientific method. Emphasizes hypothesis testing, the notion of statistical significance, and tests of difference. The goal of this course is to endow students with the fundamental data management, review, reengineering, and exploration skills as necessary data analytical competencies.

ALY 6020. Predictive Analytics. 3 Hours.
Introduces the end-to-end data-driven statistical modeling and predictive modeling approach in R with applications and case studies. Includes all the data and modeling steps in a full modeling cycle, including data ETL process, exploratory data analysis and data cleansing for outlier imputation and data normalization, commonly applied modeling techniques such as linear regression and logistic regression, modeling steps such as model training, and validation and testing. R is introduced as the data processing, analysis, and modeling tool and is used in the case studies.

ALY 6030. Data Warehousing and SQL. 3 Hours.
Focuses on the management, mining, and interpretation of patterns in large databases. Offers students an opportunity to learn how organizations construct data warehouses from operational databases, about different data warehouse architectures, how to build a data warehouse, and how to structure databases for efficient data mining. Discusses relational databases and Structured Query Language (SQL) for the fundamentals in data modeling, database management, and SQL queries. Introduces other modern database systems such as NoSQL (non SQL) and column-based databases.

ALY 6040. Data Mining Applications. 3 Hours.
Introduces the theories and tools for intensive data analysis methods and data mining techniques such as rule-based learning, decision trees, clustering, and association-rule mining. Also covers interpretation of the mined patterns using visualization techniques. Offers students an opportunity to gain the knowledge and experience to apply modern data-mining techniques for effective large-scale data pattern recognition and insight discovery. Introduces data analysis software; student teams evaluate, analyze, and report data for the methods used and insights discovered during case studies.
ALY 6050. Introduction to Enterprise Analytics. 3 Hours.
Introduces the field of enterprise data analytics, which is defined as the extensive use of data, statistical and quantitative analysis, exploratory and predictive models, and fact-based decision making to drive business strategies and actions. Discusses a few widely practiced data analytics areas, such as marketing analytics, retail analytics, financial analytics, people analytics, as well as general industry practices in end-to-end analytics development cycles, including data management, data engineering, analytics modeling, and strategy development. Offers students an opportunity to learn how to use quantitative techniques for strategic business decision making. Introduces specific analysis techniques including forecasting, simulation, linear programming, and optimization.

ALY 6060. Decision Support and Business Intelligence. 3 Hours.
Introduces current and emerging business analytical concepts and information technologies to support decision making and business intelligence. Commercial decision support systems in various application areas are introduced and discussed using case studies, including CRM (customer relationship management) for customer management, web analytics applications, sales force management systems, etc. Introduces business intelligence technology and applications, such as OLAP (Online Analytical Processing), OBIEE (Oracle Business Intelligence Enterprise Edition), and IBM Cognos. Offers students an opportunity to gain hands-on experience using business intelligence tools, including Tableau or QlikView.

ALY 6070. Communication and Visualization for Data Analytics. 3 Hours.
Offers an interdisciplinary examination of design concepts and cognitive and communication theories that support effective practices for data visualization and communication. Considers the relationship between information and audience and studies effective techniques in the written, spoken, and visual communication of complex quantitative information. Project-based activities offer students opportunities to apply these techniques in a manner that makes data understandable, compelling, and actionable. Introduces R Shiny in the lab sessions as the tool for data visualization.

ALY 6080. Integrated Experiential Learning. 3 Hours.
Offers a practicum in the development and delivery of predictive data analysis for strategic decision making in organizations. Offers students an opportunity to apply the principles and tools of analytics to real-world problems in business organizations and to develop and present analytical insights and recommendations for successful implementation of their capstone project.

ALY 6100. Data-Driven Decision Making. 3 Hours.
Designed to provide an in-depth focus on data-driven decision making in organizations. Examines the models, tools, techniques, and theory of data-driven decision making that can improve the quality of business leadership decisions through solution-based case studies.

ALY 6110. Data Management and Big Data. 3 Hours.
Designed to provide the student with the core concepts of data collection and management. Topics include systems for collecting data and implications for practice; types of data (textual, quantitative, qualitative, etc.); and storing data with privacy and security issues in mind. Offers students an opportunity to obtain a high-level understanding of big data technologies for data accessibility, efficiency, and security of data management at scale, including big data storage and computing technologies and big data analytics applications. Students create a working system for data acquisition and management using publicly available data sets and evaluate traditional data warehouse platforms as well as cloud-based big data storage and computing technologies. Azure is also introduced and used in the lab sessions.

ALY 6120. Leadership in Analytics. 3 Hours.
Covers analytical leadership principles for the structure and dynamics of organizations, combining relevant research to offer students an opportunity to deepen their understanding of effective change in business analytical decision making.

ALY 6130. Risk Management for Analytics. 3 Hours.
Seeks to provide a conceptual overview of analytic risk management. Offers students an opportunity to evaluate and analyze financial, technical, and other business risk-assessment and risk-modeling techniques and tools.

ALY 6980. Capstone. 3 Hours.
Offers an advanced practicum in the development and delivery of predictive data analysis for strategic decision making in organizations. Students apply the principles and tools of analytics to a comprehensive real-world problem or project within a sponsoring organization. Expect students to present analytical insights and recommendations for successful implementation of their capstone project.

ALY 6983. Topics. 3 Hours.
Discusses contemporary topics in analytics for a rotating variety of industries (nonprofit and for-profit).

**Anthropology (ANTH)**

ANTH 1000. Anthropology at Northeastern. 1 Hour.
Intended for first-year students in the College of Social Sciences and Humanities. Introduces students to liberal arts; familiarizes them with their major; develops the academic skills necessary to succeed (analytical ability and critical thinking); provides grounding in the culture and values of the University community; and helps to develop interpersonal skills—in short, familiarizes students with all skills needed to become a successful university student.

ANTH 1101. Peoples and Cultures. 4 Hours.
Surveys basic concepts in cultural anthropology by looking at a range of societies and the issues they face in a globalizing world. Examines the manner in which cultures adapt to, reject, or modify all of the changes they face. These changes impact everything from traditional family structure, to religion, gender, all the way to patterns of joking and concepts of beauty the world over.

ANTH 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ANTH 2300. Reading Culture through Ethnography. 4 Hours.
Examines culture by reading some of the discipline’s best-known ethnographic works and by revisiting core anthropological themes and methods. Emphasizes critical reading practices within anthropology, how ethnographies and their subjects are constructed, and how anthropologists bring their perspectives to bear upon the study of culture.

ANTH 2302. Gender and Sexuality: A Cross-Cultural Perspective. 4 Hours.
Examines popular and scientific notions about sex, gender relations, family, and kinship. Examines why our images of family, masculinity, and femininity are not universal by analyzing the patterns of sex roles, sexual practices, and kinship in other cultures. Discusses how and why relations between men and women change during times of socioeconomic and political change. ANTH 2302 and WMNS 2302 are cross-listed.
ANTH 2305. Global Markets and Local Culture. 4 Hours.  
Examines selected topics in the socioeconomic transformation of other cultures, including urbanization, industrialization, globalization, commodity production, and international labor migration. Focuses on the impact of global capitalist development on contemporary developing and postcolonial societies as well as local responses and/or resistances to those changes.

ANTH 2306. Global Markets and Local Cultures Abroad. 4 Hours.  
Examines selected topics in the socioeconomic transformation of other cultures, including urbanization, industrialization, globalization, commodity production, and international labor migration. Focuses on the impact of global capitalist development on contemporary developing and postcolonial societies as well as local responses and/or resistance to those changes. To be taken as part of a Dialogue of Civilizations. May be repeated without limit.

ANTH 2312. The Anthropology of Masculinity. 4 Hours.  
Provides a cross-cultural examination of the ways in which social and cultural institutions shape men, and how men respond to those institutions. After studying the ways in which gender is constructed, the ways in which women are distinguished from men, and a history of masculinity, the course explores the range of masculinities that compete with one another for expression. Uses case studies from Latin America, Melanesia, North America, and Africa.

ANTH 2315. Religion and Modernity. 4 Hours.  
Introduces a cross-cultural, comparative perspective on religious practice and belief. Explores theoretical definitions of and methodological approaches to the study of religion, as well as more specific concepts of ritual, myth, healing, and identity. Select case studies allow for an in-depth look at the unique formations of a few religious practices and groups.

ANTH 2330. Environmental Anthropology. 4 Hours.  
Introduces the study of human-environment interactions over time and across cultures. Drawing on a range of scholarship from ecological anthropology, environmental history, political-economy, and environmental justice, this class examines transitions in subsistence systems and cultural factors from early hunting-gathering societies through to industrial giants in a globalizing world.

Introduces the social studies of science. How and why is science vital to contemporary public controversies? Whose expertise and data should we trust and why? How do scientific facts and practices change over time? Examines public controversies in which science and scientists play a determining role (e.g., climate change, endocrine disruption, smoking and cancer, and genetic engineering). Studies how and why scientific practice creates social and ethical challenges by looking at controversies produced through scientific research, including model organisms, stem cells, and cell lines. Offers students an opportunity to learn how scientific cultures develop by performing ethnographic fieldwork within laboratories and in class projects that engage students in how scientific facts and figures are made and unmade.

ANTH 2350. Urban Anthropology. 4 Hours.  
Introduces students to the anthropological literature on cities and their subjects. Explores the ways in which cities are seen as places of cultural fascination and exchange, as well as spaces of modernity and futurity. Analyzes the urban character of contemporary cultural, political, economic, and global processes that take place in cities, and provides foundational concepts to understand urban spaces, the construction of urban identities, the complexities of urban living, and the local and global significance of cities.

ANTH 2365. Sport, Culture, and Society. 4 Hours.  
Looks at the ways in which sport reflects and obscures social and cultural institutions. Half of the course focuses upon American sport, and the rest upon the global character that modern sport has taken on. Case studies are used from the United States, Dominican Republic, Japan, Brazil, and elsewhere.

ANTH 2990. Elective. 1-4 Hours.  
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ANTH 2991. Research Practicum. 2-4 Hours.  
Involves students in collaborative research under the supervision of a faculty member. Offers students an opportunity to learn basic research methods in the discipline. Requires permission of instructor. May be repeated once for up to 4 total credits.

ANTH 3120. Consumer Cultures. 4 Hours.  
Introduces students to anthropological theories of consumption and debates about the "social life of things." Explores the politics invested in material objects ranging from hijab fashions in Teheran to forms of global hipsterism, debates about nationalism and commodity cultures, as well as the political economy of production and consumption. Includes, but is not limited to, commodity fetishism, value, social/cultural capital, distinction, neoliberalism, consumerism, and materiality.

ANTH 3410. Ethnographic Field Experience. 4 Hours.  
Offers students an opportunity to experience fieldwork while studying current ethnographic methods and theory and to design a semester-long ethnographic field research project. Field sites may include public and outdoor spaces, online communities, cultural centers, schools, immigrant neighborhoods, sports organizations, social service agencies, nonprofit groups, religious institutions, etc.

ANTH 3415. Anthropology of Travel and Tourism. 4 Hours.  
Examines the rationale and functions of tourism around the world. Explores the relationship between tourist and hosts from the following perspectives: kinds of tourism, the tourist “desire”; the tourist “gaze”; and the ways in which hosts manipulate the relationship. Examines the nature of what constitutes satisfaction and sustainability of tourism.

ANTH 3417. Political Anthropology. 4 Hours.  
Examines the anthropology of politics, focusing on the anthropology of the state. Studies the history of political anthropology with its roots in British structural-formalism and contextualizes it within the anthropology of Africa and witchcraft. Explores the linkages between the nation and the state, using classic works of Benedict Anderson on nationalism, before commencing an in-depth study of the problems of the state, classical theories of the state and statecraft, and how these ideas are traced to contemporary ethnographies of politics. Students interested in the study of resistance, displacement, social exclusion, citizenship, state violence, and communities may find this course relevant to their interests.

ANTH 3418. Wired/Unwired: Cybercultures and Technopolitics. 4 Hours.  
Explores the impacts of technology and new media on politics, society, and culture. Emphasizes the socioeconomic and political frameworks within which technologies are embedded as well as the role of technology and the Internet in contemporary political and cultural movements. Topics may include the political and cultural effects of the census, the radio, and the camera; the history of the Internet; virtual worlds and communities; online politics and activism; as well as blogging, gaming, and social networking.
ANTH 3421. Foundations of Anthropological Theory. 4 Hours.
Introduces the foundations of anthropological theory. Examines recurring themes surrounding structure and agency, culture and power, and the tension between the individual and society. Addresses these questions by returning to anthropology’s Enlightenment roots, early evolutionary thought, classic and contemporary theories, as well as ongoing critiques of the discipline. Explores different schools of thought, including functionalism, structural functionalism, symbolism, interpretivism, and more recent theoretical developments that address history, political economy, reflexivity, poststructuralism, and feminism, as well as transnational/global and activist approaches. Requires prior completion of two ANTH courses numbered 1000 or above.

ANTH 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ANTH 4350. Ethnography of Southeast Asia. 4 Hours.
Offers a seminar on the societies and cultures of Southeast Asia. Uses an interdisciplinary approach to this diverse and dynamic geopolitical region, with readings from anthropology, history, political science, and literature. Covers the major political and cultural changes that have shaped Southeast Asia in relation to the world—from the age of colonial expansion, to the rise of nation-states, to the present global era. Examines central questions in the ethnography of Southeast Asia, emphasizing the postcolonial legacies of Southeast Asia, states and violence, culture and mobility, and pressing contemporary issues in globalizing Southeast Asia. ANTH 4530 and INTL 4530 are cross-listed.

ANTH 4500. Latin American Society and Development. 4 Hours.
Explores the processes of social, economic, and cultural change in Latin America. While concentrating on the present, traces class formation, agrarian structures, ethnic identity, ceremonial organization, gender roles, and political conflict since the colonial era in a range of countries. Emphasizes the relationship of communities and national political and economic systems. May emphasize Central America and Mexico or countries in South America through case studies. ANTH 4500 and INTL 4500 are cross-listed.

ANTH 4505. Native North Americans. 4 Hours.
Examines Native American cultures and their reactions to Anglo-American attempts to, first, remove them from their lands and, then, incorporate them into the contemporary framework of modern America. Selects specific groups to explore contemporary issues, including native gaming, racism, gender, cultural appropriation, and economic development.

ANTH 4510. Anthropology of Africa. 4 Hours.
Explores Africa's changing place in the world. Studies the history of Africa and explores the role of ethnography in the making of colonial Africa and the cultural transformations and continuities produced by the emergence of African cities during and after colonialism. Studies postcolonial Africa to critically and comparatively engage with contemporary issues facing African societies. Considers the efflorescence of new cultural forms of music, art, film, and literature, in conjunction with new sources of identity such as nationality, religion, ethnicity, consumption, and migration. ANTH 4510 and INTL 4510 are cross-listed.

ANTH 4515. Culture and Politics in Modern India. 4 Hours.
Introduces the histories, cultures, and peoples of India. Seeks to convey a sense of how knowledge has been constructed about the region and how the subcontinent has been shaped by its engagements with the world through such processes as colonization, state building, and globalization. Uses readings, films, and class discussions to examine themes and topics that include Orientalism, postcolonialism, caste and community, gender and sexualities, conflict and violence, development and resistance, and transnational structures and processes. Critically evaluates some commonly held assumptions, including classical understandings of tradition and modernity, cohesion and conflict, and nation and identity. ANTH 4515 and INTL 4515 are cross-listed.

ANTH 4580. Special Topics in Anthropology. 4 Hours.
Designed as a specialized themes course for students with prior experience in anthropology and/or sociology. Offers unique opportunities—visiting guests, special thematic interests— which are not part of the regular curriculum. May be repeated without limit.

ANTH 4600. Senior Seminar. 4 Hours.
Designed to deal with anthropological theory and work with students who are asked to apply these theories to some of their own work. Content may vary.

ANTH 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8-credit honors project. May be repeated without limit.

ANTH 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ANTH 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ANTH 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

ANTH 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ANTH 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ANTH 4994. Internship. 4 Hours.
Offers students an opportunity for internship work. May be repeated without limit.

ANTH 4996. Experiential Education Directed Study. 4 Hours.
Offers independent work on a chosen topic under the direction of a member of the department. May be repeated without limit.

ANTH 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.
ARAB 1101. Elementary Arabic 1. 4 Hours.
Designed for students with very little or no prior knowledge of Modern Standard Arabic. Provides a lively introduction to basic oral expression, listening comprehension, and elementary reading and writing. Uses practical vocabulary drawn from realistic situations, and aims at good pronunciation and ease in response. Laboratory practice complements class work, enables students to work aloud at their own speed, reinforces their acquisition of essential structures, and acquaints them with various audio-visual resources.

ARAB 1102. Elementary Arabic 2. 4 Hours.
Continues ARAB 1101. Reviews and continues the study of grammar and basic language skills. Offers progressively more intensive practice in oral and written communication. Laboratory practice complements class work, enables students to work aloud at their own speed, reinforces their acquisition of essential structures, and acquaints them with various audio-visual resources.

ARAB 1301. Elementary Arabic Immersion 1. 4 Hours.
Designed for students who are in an Arabic-speaking country, this is an off-campus immersion course. Focuses on standard Arabic. Offers students an opportunity to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

ARAB 1302. Elementary Arabic Immersion 2. 4 Hours.
Designed for students who are in an Arabic-speaking country, this is an off-campus immersion course. Focuses on standard Arabic. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

ARAB 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARAB 2101. Intermediate Arabic 1. 4 Hours.
Emphasizes further vocabulary building. Offers students an opportunity to master the fine points of grammar through written composition, prepared oral reports, and reading and discussion from current standard Arabic materials.

ARAB 2102. Intermediate Arabic 2. 4 Hours.
Builds on ARAB 2101 and focuses on further development of vocabulary. Offers students an opportunity to continue to master grammar and conversation through written composition, prepared oral reports, and reading and discussion from current standard Arabic materials.

ARAB 2301. Intermediate Arabic Immersion 1. 4 Hours.
Designed for students who are in an Arabic-speaking country, this is an off-campus immersion course. Focuses on standard Arabic. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

ARAB 2302. Intermediate Arabic Immersion 2. 4 Hours.
Designed for students who are in an Arabic-speaking country, this is an off-campus immersion course. Focuses on standard Arabic. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

ARAB 2701. Intensive Arabic 2. 4 Hours.
Offers students an opportunity to develop proficiency in modern standard Arabic and in developing knowledge of spoken Arabic, especially the Egyptian and Levantine dialects. Focuses on building language skills and mastering more vocabulary and grammar. Includes short readings, composition exercises, review of basic Arabic grammar, and extensive training in listening and conversation. The textbook is supplemented with material that includes print media, audios, and videos. Some of the material is available on the companion Web site for the textbook, Al-Kitaab; other material is prepared by the instructor. Requires students to purchase access to the Web site. Seeks to complete all thirteen units of Al-Kitaab by the end of the course. Preq. ARAB 1701 or ARAB 1102.
ARAB 2900. Specialized Instruction in Arabic. 1-4 Hours.
Designed for individuals whose language skills are at the intermediate level and who seek specially focused language instruction. Such instruction might be the use of the language in specific settings, or it might be focused on specific conversational nuances of the language. Students must have at least an elementary level of competence in the language. May be repeated without limit.

ARAB 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARAB 3101. Advanced Arabic 1. 4 Hours.
Continues further development of vocabulary. Offers students an opportunity to continue to master grammar and conversation through advanced reading, composition, grammar review, and listening skills. Whenever possible, offers students an opportunity to engage in local community activities to enhance communication skills and cultural knowledge.

ARAB 3102. Advanced Arabic 2. 4 Hours.
Builds on ARAB 3101 and continues further development of vocabulary. Offers students an opportunity to continue to master grammar and conversation through advanced reading, composition, grammar review, and listening skills. Whenever possible, offers students an opportunity to engage in local community activities to enhance communication skills and cultural knowledge.

ARAB 3301. Advanced Arabic Immersion 1. 4 Hours.
Designed for students who are in an Arabic-speaking country, this is an off-campus immersion course. Focuses on standard Arabic as well as the local dialect. Offers students an opportunity to continue to develop grammatical and conversational competence.

ARAB 3302. Advanced Arabic Immersion 2. 4 Hours.
Designed for students who are in an Arabic-speaking country, this is an off-campus immersion course. Focuses on standard Arabic as well as the local dialect. Offers students an opportunity to continue to develop grammatical and conversational competence.

ARAB 3701. Intensive Arabic 3. 4 Hours.
Offers students an opportunity to build language skills and master more advanced vocabulary and grammar. Focuses on developing proficiency in standard and spoken Arabic to a degree where similarities and differences between the two are analyzed and assimilated. Includes readings of medium length, composition exercises, review of Arabic grammar, listening skills, and conversation practice in standard Arabic and in one of the two dialects introduced in ARAB 1701 and ARAB 2701 (ARAB 4701 focuses on the other dialect). Begins with a brief review of Al-Kitaab 1 and moves on to the first half of Al-Kitaab 2. To prepare students for ARAB 4701, the class devotes at least one full weekly meeting to media Arabic.

ARAB 3800. Special Topics in Arabic. 1-4 Hours.
Focuses on a unique aspect of the Arabic language. The specific topics are chosen to reflect current developments in the language and expressed student interests. Focuses on the use of the language for specific purposes or its use in specialized settings (e.g., media, business, health). Requires at least an intermediate level of skill in the language. May be repeated up to three times.

ARAB 3900. Specialized Instruction in Arabic. 1-4 Hours.
Designed for individuals whose language skills are at an advanced level and who seek specially focused language instruction. Such instruction might be the use of the language in specific settings, or it might be focused on specific conversational nuances of the language. Requires at least an advanced level of competence in the language. May be repeated without limit.

ARAB 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARAB 4701. Intensive Arabic 4. 4 Hours.
Continues with the approaches of ARAB 3701 to build language skills toward higher proficiency in both standard and spoken Arabic. Offers students an opportunity to use their knowledge in one to enhance their skills in the other by studying and analyzing the similarities and differences between the two. Includes readings, composition exercises, review of Arabic grammar, listening skills, and conversation practice in standard Arabic and in one of the two dialects introduced in ARAB 1701 and ARAB 2701—Egyptian or Levantine. Continues with and finishes Al-Kitaab 2. Offers students an opportunity to achieve proficiency equivalent to “advanced intermediate.”

ARAB 4800. Special Topics in Arabic. 1-4 Hours.
Focuses on a unique aspect of the Arabic language. The specific topics are chosen to reflect current developments in the language and expressed student interests. Focuses on the use of the language for specific purposes or its use in specialized settings (e.g., media, business, health). Requires at least an advanced level of skill in the language. May be repeated up to four times.

ARCH 1000. Architecture at Northeastern. 1 Hour.
Introduces students pursuing a major in the School of Architecture to the intellectual and extracurricular opportunities within the school and within the College of Arts, Media and Design. Exposes students to the cultural vibrancy of Boston with the goal of building networks to facilitate the creation of a vibrant and supportive learning community.

ARCH 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARCH 4990. Specialized Instruction in Architecture. 1-4 Hours.
Continues with the approaches of ARCH 3900 to build multidisciplinary skills toward higher proficiency in the field of architecture. Offers students an opportunity to use their knowledge in one to enhance their skills in the other by studying and analyzing the similarities and differences between the two. Includes readings, composition exercises, review of architecture principles, listening skills, and conversation practice in standard Arabic and in one of the two dialects introduced in ARCH 1701 and ARCH 2701—Egyptian or Levantine. Continues with and finishes Al-Kitaab 2. Offers students an opportunity to achieve proficiency equivalent to “advanced intermediate.”

ARCH 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

ARCH 4992. Directed Study. 1-4 Hours.
Offers students a way of going beyond work given in the regular curriculum; may also enable students to complete major or minor requirements in certain situations. Priority is given to language majors and to juniors and seniors. May be repeated without limit.

ARCH 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ARCH 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ARCH 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ARCH 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
ARCH 1030. Introduction to Architectural Education, Practice, and Culture. 2 Hours.
Seeks to answer the question of how architects work as problem solvers on a variety of scales and in collaboration with a variety of disciplines. Studies how architects frame problems, iteratively test options, and implement solutions that are both both practical and creative. Considers both traditional and emerging modes of practice. Comprised of lectures, small-group discussions, readings, case studies, visits to local design offices, and field trips to important buildings and landscapes in the greater Boston area.

ARCH 1050. Introduction to Architectural Design. 4 Hours.
Offers students an opportunity for hands-on investigations in the design process. The course begins with instruction on representational techniques such as drawing and sketching, model making, diagramming, and collage, using Boston as a laboratory for investigation. Individual and group design work seeks to encourage the development of skills in critical thinking, leadership, collaboration, and graphic communication. Emphasizes a solutions-based approach to design problem solving. Also introduces students to studio culture, including regular individual desk critiques with instructors, collaborative working pinups, and formal reviews with guest critics.

ARCH 1110. Fundamental Architectural Representation. 6 Hours.
Introduces students to architectural representation as a form of documentation, experimentation, and communication, through a series of exercises in orthographic, axonometric, and perspectival projection as well as physical modeling. Emphasizes the development of an iterative design methodology. Includes workshops in introductory digital media.

ARCH 1120. Fundamental Architectural Design. 6 Hours.
Introduces architectural design. Examines a number of approaches to spatial organization, massing, and envelope articulation through the analysis of pertinent case studies as well as through a series of fast-paced design exercises. Offers students an opportunity to develop a single design through a series of design studies that deal with issues of site planning, program, user input, and collective negotiation. Requires a portfolio demonstrating the student’s representational abilities and iterative design process.

ARCH 1310. Architecture and Global Cultures, Prehistory to 1400. 4 Hours.
Offers a chronological history of civilizations from prehistory to 1400. Global in scope, introduces key themes including housing, the vernacular, materials and techniques, sacred architecture, architecture and power, and urban planning. Emphasizes the relationship between architectural works and the cultures that produce them.

ARCH 1311. Recitation for ARCH 1310. 0 Hours.
Offers a small-group discussion format to cover material in ARCH 1310.

ARCH 1320. Architecture and Global Cultures, 1400 to Present. 4 Hours.
Offers a chronological history of early modern architecture. Focuses on significant moments in Western culture as well as the architecture and planning of Mughal India, Ottoman Empire, and Japan. Continues major themes from ARCH 1310. Also covers ideal cities and urban planning, the relationship between theory and practice, the Enlightenment, the emergence of the professional architect, trade, colonization, and landscape.

ARCH 1321. Recitation for ARCH 1320. 0 Hours.
Offers a small-group discussion format to cover material in ARCH 1320.

ARCH 1350. American Architecture. 4 Hours.
Offers an introduction to the history, theory, and criticism of American architecture and urban planning from the mid-1600s to the 1930s. Explores the social and cultural forces that shape the built environment. Examines European influences as well as uniquely American contributions. Emphasizes the work of Louis Sullivan, H. H. Richardson, and Frank Lloyd Wright.

ARCH 1450. Understanding Design. 4 Hours.
Introduces undergraduates at all levels to the importance of design thinking as a method of inquiry and problem solving. Each class meeting includes a short presentation on a different kind of design problem (houses, furniture, electronics, automobiles, apparel, tools, interiors, cities, typography, information, tall buildings, networks, etc.) and then an interview with a leading practitioner at a roundtable on the stage. Evaluation is based on quizzes and student presentations. Seeks to expose students to the power of design thinking as a tool for multi-variable problem solving.

ARCH 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARCH 2130. Site, Space, and Program. 6 Hours.
Studies how to analyze, draw, and model the built environment. Students engage in issues of program, composition, type, and material. Offers students the opportunity to think conceptually about architectural design.

ARCH 2140. Urban Institutions. 6 Hours.
Studies how to analyze, model, and intervene in the city. Offers students an opportunity to engage in urban analysis, urban massing strategies, and architectural design of urban institutions.

ARCH 2170. Urban Research Studio: Context, Sustainability, Development. 6 Hours.
Seeks to develop students’ technical skills and critical thinking in the studio environment through a semesterlong research and design project. Offers students an opportunity to investigate an urban site in the Boston area: investigating possible solutions, focusing on strengthening conceptual strategies, and articulating a developed argument through their research and design process.

ARCH 2240. Architectonic Systems. 4 Hours.
Introduces the theory of materials and structures. Examines basic structural elements in masonry and wood construction. Uses historical and current building types to explore the relationship between structure, materials, construction process, and architectural space. Includes lectures, discussions, field trips, and student presentation of structural models and diagrams.

ARCH 2250. Introduction to Sustainable Design in Architecture. 4 Hours.
Explores the issues and practices of architectural design as it relates to natural systems, using critical readings of seminal and current texts, lectures, films, field trips, and projects that use both design and analysis as means of inquiry. Examines varied approaches to sustainable design, including using nature and wilderness as models; biophilia; biomimicry; material sources and reuse; accounting systems such as LEED, Zero Net Carbon, and the 2030 Challenge; and the Living Building Challenge. Course work couples these thematic explorations with projects that investigate the application of the ideas in built form. Designed to offer both a broad understanding of sustainable design and a deep understanding of the varied ways one might approach green as a design professional.
ARCH 2260. Introduction to Building Systems. 4 Hours.
Introduces fundamentals of building technology and explores technology as means and manifestation of architecture in the world. Using a systems approach, studies the interactions among natural forces, material properties, technological capabilities, and human cultural values and the ways these relationships give rise to architecture. Considers a series of physical principles—including gravity, moisture, heat, light, and air—to reveal specific architectural possibilities and material responses. Explores the ways design shapes the interaction of materials and forces to provide for human safety, shelter, comfort, and delight through a combination of hands-on workshops, seminars, readings, and design exercises.

ARCH 2310. Chinese Architecture 1: Premodern. 4 Hours.
Covers the development of the built environment in China from prehistory to the nineteenth century. Emphasizes technological transformation, structural and stylistic evolvement, cultural exchange, and ideological engagement.

ARCH 2320. Chinese Architecture 2: Modern. 4 Hours.
Covers the development of the built environment in China from 1840 to the present. Emphasizes educational and professional shifts in architectural practice, political engagement in the design process, structural and technological transformation, conceptual background, and global impact.

ARCH 2330. Architecture, Modernity, and the City, 1800 to 1910. 4 Hours.
Focuses on architecture and urban design in the United States and Europe from 1800 to 1910. Major topics include the birth of the modern city and urban planning, capitalism and industrialization, modern typologies, infrastructure, urban parks and early suburbs, materials and technology, Western architecture in colonial India and Asia, architectural education, and modern architectural theory.

ARCH 2341. Recitation for ARCH 2340. 0 Hours.
Offers a small-group discussion format to cover material in ARCH 2340.

ARCH 2340. Architecture, Modernity, and the City, 1910 to 1980. 4 Hours.
Examines the forms and principles of European and American architecture of the twentieth century in the context of society's changing conditions. Major topics include craft vs. industry, avant-garde and "other" modernisms, the architect and critical positions, suburbs, new concepts of space, modernism and its critique, and global extensions of modernism.

ARCH 2341. Recitation for ARCH 2340. 0 Hours.
Offers a small-group discussion format to cover material in ARCH 2340.

ARCH 2360. Design Thinking and Architecture. 4 Hours.
Exposes students to the key principles of design thinking, focusing in particular on its relationship to architecture and how the specific skills of the architects are integral to its definition. At its core, design thinking offers a specific framework for innovation. By exposing students to the ways in which design thinking has been theorized and defined, offers students an opportunity to develop a more detailed understanding.

ARCH 2550. Real Estate Development and Design. 4 Hours.
Introduces the challenges and opportunities in real estate development for design professionals. Offers students an opportunity to obtain the knowledge and skills necessary to engage meaningfully in real estate development, which is exercised through application to real-life problems. Reviews the property types, terminology, and core concepts in the real estate industry; introduces a set of analytical tools and techniques for evaluating real estate investment and development; and explores innovation and entrepreneurship in real estate development practice models.

ARCH 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at consortium institutions. May be repeated without limit.

ARCH 3155. Studio Abroad. 6 Hours.
Offers students an opportunity to understand the challenges of designing contemporary building types in parallel situations—the dense historic fabric of a city with ancient origins that has been manipulated over centuries and the more diffused, diverse, and irregular landscape typically found on the edge of the modern city. Offered only abroad.

ARCH 3165. Suburban Types. 6 Hours.
Explores the important differences in designing for dense cities vs. more automotive suburbs in a studio format. Offers students an opportunity to study existing urban and suburban building types and then design for similar use in the two different settings.

ARCH 3170. Architecture, Infrastructure, and the City. 6 Hours.
Offers a studio course addressing the architectural and urbanistic consequences at the intersection of large-scale infrastructure and the contemporary city. Focuses on how to integrate buildings and neighborhoods with highways, rail lines, storm water management, bus, bike, parking, rivers, watersheds, and industrial networks.

ARCH 3350. American Houses and Housing. 4 Hours.
Examines the architecture of American houses from first settlements of European colonists in the sixteenth century to issues in the twentieth century. Aims to uncover the ways that architecture, seen through the lens of a particular building type, responds to the demands of materials, climate and geography, ethnic traditions, artistic expression, and changing societal forms. Requires prior completion of architectural history course or permission of instructor.

ARCH 3351. Architecture Topics Abroad: Theory. 4 Hours.
Explores, defines, and analyzes the embodied time within urban artifacts (ruins, buildings, urban landscape and space, infrastructure) of a historic context. Focuses on the architecture and urban artifacts that are the consequence of the evolutionary forces of urban civilization over long durations of time rather than focusing on iconographic examples of architecture and urbanism produced within a specific moment in history. Students engage in theoretical readings, group discussions, site visits, analyses of evolutionary urban artifacts, writing, and drawings. Assigned readings cover a broad range of theories about analyzing and interpreting the urban context and its history. These readings are complemented by both required writing assignments and site visits to many urban artifacts, buildings, and spaces. May be repeated without limit.

ARCH 3352. Architecture Topics Abroad: Drawing. 4 Hours.
Examines and engages historic architecture and urbanism through freehand drawing. Offers students an opportunity to learn how to draw in freehand like an architect—drawing in a creative, interpretive, precise, and analytical manner—as well as to learn about the history and cultural context of the great architectural monuments and urban spaces that they are analyzing and drawing, including major architectural monuments. Studies new skills of drawing, the conventions of architectural representation, and the cultural history of the built environment. May be repeated without limit.

ARCH 3361. Architecture and Urbanism Abroad. 4 Hours.
Covers the detailed history of architecture and urban development in the host city, from its founding to the present. Offered only abroad.

ARCH 3362. Seminar Abroad. 4 Hours.
Offers students an opportunity to learn and discuss historical and contemporary European theory and criticism, from Vitruvius and Alberti to contemporary figures. Raises and addresses architectural questions of composition, society, politics, and environment. Offered only abroad.
ARCH 3364. Architecture and Planning in 21st-Century China. 4 Hours.
Offers real-world insight into the fastest-growing urbanization process in the world. Offers students an opportunity to learn about the physical history of Chinese cities, especially Shanghai, Beijing, and Hangzhou. Explores the differences in scale of both contemporary and historic urban fabric, building types, and development types. Students are encouraged to produce case studies comparing and contrasting these elements. May be repeated up to three times.

ARCH 3370. Topics in Architectural History. 4 Hours.
Covers a variety of topics in architectural history and theory with the aim of offering students a greater degree of choice in shaping their curriculum and the opportunity to study subjects that interest them in greater detail. Course topics encompass a wide range of themes and complement the mission of the department, the college, and the university. Taught by a number of different faculty members according to their interests and expertise.

ARCH 3450. Advanced Architectural Communication. 4 Hours.
Builds on CAD (computer-aided design) skills to develop ability to model in three dimensions and develop surfaces and lighting. Also addresses strategies in design communication for effective presentation of digital material.

ARCH 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at consortium institutions. May be repeated without limit.

ARCH 4850. Urban and Architectural History Abroad. 4 Hours.
Offers an on-site study of architecture and urban history conducted abroad. Instructors accompany students to visit and lecture about the most significant sites in the history of architecture, art, and urban development of a specific country. In comparison to a traditional on-campus course, the number of examples covered is smaller; however, each example is discussed in much greater detail. Encourages students to discover problems and aspects in art, architecture, and urbanism that have not been raised before, something only possible through direct survey and observation. Offers students an opportunity to obtain a real sense of architectural research without neglecting the basics of the field. Interactions with practicing architects, city planners, policymakers, preservationists, museum professionals, and artists are integral parts of this course. May be repeated without limit.

ARCH 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

ARCH 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ARCH 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at consortium institutions. May be repeated without limit.

ARCH 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

ARCH 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ARCH 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ARCH 4994. Internship. 4 Hours.
Offers students an opportunity for internship work. May be repeated without limit.

ARCH 4996. Experiential Education Directed Study. 4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using the course to fulfill their experiential education requirement. May be repeated without limit.

ARCH 5110. Housing and Aggregation. 6 Hours.
Provides an understanding of multiunit housing in the United States and Europe. Working in teams, students develop new patterns of housing for Boston-area sites and develop those sites with their own individual interventions.

ARCH 5115. Option Studio. 6 Hours.
Offers an upper-level design studio that covers new studio topics, content, and studio instructors each semester. The studio instructors offer topical content that best aligns with their research and practice expertise, which provides students with the latest concepts in architectural design, theory, and research on a consistently updated and rotating basis. Students select their top choices of studio topics and instructors, giving them more flexibility in the areas for which they would like to focus their education.

ARCH 5120. Comprehensive Design Studio. 6 Hours.
Focuses on the materials and making of architecture. Considers architectural connections at all scales, from the nut and bolt to the scale of a door or window to the scale of the whole building and the city. Grounds design proposals upon a tectonic strategy, unlike traditional design studios that produce a schematic design before considering constructional ideas.

ARCH 5210. Environmental Systems. 4 Hours.
Explores the ways in which architectural form can create particular conditions of light and shadow; provide shelter from heat, cold, and rain; and incorporate systems that provide for water, electricity, and sanitation. Provides a series of simple and straightforward small-scale design projects.

ARCH 5211. Recitation for ARCH 5210. 0 Hours.
Offers a small-group discussion format to cover material in ARCH 5210.

ARCH 5220. Integrated Building Systems. 4 Hours.
Studies how to integrate into students’ building designs all the environmental and tectonic systems that they have covered in previous architecture courses.

ARCH 5230. Structural Systems. 4 Hours.
Introduces the fundamental concepts of structural analysis and design for architecture. Examines the nature of forces and their effects on different types of structural elements; the structural properties of shapes and materials; and the selection, analysis, and design of efficient structural systems that resist the loads acting upon them. Uses historical and contemporary examples to illustrate how the changing context of architectural ideas drives structural form and the selection of structural systems. Includes field trips and student presentations of structural models and diagrams. Restricted to students in the architecture BS program and to students in the three-year MArch program.

ARCH 5231. Recitation for ARCH 5230. 0 Hours.
Provides a small-group discussion format to cover examples from the material in ARCH 5230.
ARCH 5310. Design Tactics and Operations. 4 Hours.
Encourages students to develop the connections between critical attitudes and techniques in design, through important historical texts. Offers a kind of "great books" approach to the integration of design and history, introducing the writings and seminal designs of Alberti, Palladio, Wright, Le Corbusier, Semper, Sitte, Rowe, Colquhoun, Moneo, Koolhaas, Rossi, Frampton, Venturi and Scott Brown, Scarpa, and Lynch.

ARCH 5320. Applications of Architectural Design Methods. 4 Hours.
Explores the different means through which we analyze, interpret, and ultimately understand the built environment and how, in turn, the built environment contributes to our understanding of the world itself. Offers students an opportunity to learn how to think critically themselves, to learn to ask questions, and to develop their own perspectives on the production of architecture and design. Students who do not meet course prerequisites may seek permission of instructor.

ARCH 5530. Innovative Models in Real Estate Development and Design. 4 Hours.
Addresses advanced topics in real estate development and finance and examines innovative models of practice in real estate development available to design professionals. Studies a set of advanced analytical tools and techniques for evaluating the cash flows and economic returns of real estate investment and development. Introduces advanced methods of financing real estate and the structure of capital markets involved in property assets. Uses the case instruction method and includes active, discussion-oriented learning.

ARCH 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ARCH 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ARCH 5984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

ARCH 6100. Graduate Skills Studio. 6 Hours.
Focuses on the design studio with ample studio access outside class meetings. Taught as a hands-on design studio (with ample studio access outside class meetings).

ARCH 6200. Graduate Studio 1: Architectural Design. 6 Hours.
Focuses on a series of increasingly complex assignments that emphasize the fundamentals of architectural design. Offers students an opportunity to propose and test proposals through an iterative process using a wide variety of tools and media, including design software, physical models, and freehand sketches. Explores spatial definition, the orchestration of a spatial sequence, modulation of natural light, and responsiveness to existing conditions (whether natural or man-made). Taught as a hands-on design studio (with ample studio access outside class meetings).

ARCH 6210. Graduate Studio 2: Urbanism. 6 Hours.
Focuses on a mixed-use building program proposed for an urban infill site in Berlin. Covers not only the conception and design of a complex work of architecture but also the broader urban design issues raised by the problem. Offers students an opportunity to test and recommend urban design proposals for the district where their proposed building is located. The course is taught as a hands-on design studio in the Berlin studio as part of the School of Architecture's Berlin program.

ARCH 6330. Seminar in Modern Architecture. 4 Hours.
Examines the state of architecture and urbanism in the two decades leading up to 2000. Explores contemporary issues in architectural theory and urban design. Examines a broad range of ideas affecting contemporary developments in architectural practice. Engages cultural and historical forces as well as contemporary criticism to define the nature of modernism, late modernism, postmodernism, and deconstruction. Case studies, analysis of theoretical models, and application of methods of history provide students with support for their own design work in studio and co-op experiences.

ARCH 6340. Graduate Topics in Architecture. 4 Hours.
Explores focused research topics relevant to the graduate program curriculum. The professor presents his or her research related to a particular urban, architectural, or technical topic. This exposes the students to methods of research and topics in current and ongoing research in the field. The students have an opportunity to engage in related and parallel research projects during the course of the semester. May be repeated without limit.

ARCH 6430. Case Studies 1. 4 Hours.
Focuses on how architectural practice occurs and must be understood within a larger social context. The cultures-interests and objectives of the constellation of participants in the bringing of a building to completion are dynamic, diverse, and complex, especially in an urban environment. Seeks to make sense of this broader social contract from within the perspective of professional design practice. As one of many participants in the process of bringing a building to completion, students review the roles, responsibilities, and interests of each contributor. Our task is to understand the obligations and constraints that constitute these relationships. Examines the products of design as manifestations of these relationships and situates them within a discourse of value-determined actions. Investigates normative and critical professional practices through selected readings and individual field research. Develops project case studies that provide examples of excellent design results achieved through the application of expert professional practices.
ARCH 6440. Case Studies 2. 4 Hours.
Continues ARCH 6430. Builds on the understanding of professional practice developed in the previous course and investigates the array of “artful ways in which some practitioners deal competently with the indeterminacies and value conflicts of practice.” These indeterminacies, uncertainties, and value conflicts are part of a rapidly changing, dynamic world. There is an unprecedented need for flexible and responsive practices that can bridge the gap between traditional professional techniques and these situations. Requires core competencies that are not mismatched with the changing situations of practice. Requires new skills as well as traditional analytic techniques to respond adequately to these unique conditions of work. Through a closer examination and development of an in-depth project case study, students speculate on possible approaches to a revised and restructured model of professional knowledge and guidelines for reflective practice that can sustain a culture of design excellence.

ARCH 6960. Exam Preparation—Master’s. 0 Hours.
Offers the student the opportunity to prepare for the master’s qualifying exam under faculty supervision.

ARCH 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARCH 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

ARCH 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

ARCH 7000. Qualifying Exam. 0 Hours.
Provides eligible students with an opportunity to take the master’s qualifying exam.

ARCH 7130. Master’s Research Studio. 6 Hours.
Offers the research portion of a two-part graduate project focused on the complex issues facing the postindustrial landscape of the contemporary city. Examines in detail the design elements of everyday building types, such as office buildings, labs, parking garages, and retail spaces, with an eye toward creating new prototypes for urban architecture that are informed by the realities of contemporary market forces. Provides the foundation for the more speculative design proposals of ARCH 7140. May be repeated without limit.

ARCH 7140. Master’s Degree Project. 6 Hours.
Offers the second of a two-part degree project focused on manipulating contemporary market-driven building types. Seeks to invent new variations and hybrids from the existing store of urban building types to address new challenges, such as irregular sites, new adjacencies, and other unmet demands in cities. Based on research, analysis, and modeling of different types done in the first semester, offers students an opportunity to propose synthetic solutions to the complex problems of postindustrial development, housing, and identity facing the contemporary city. May be repeated without limit.

ARCH 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at consortium institutions. May be repeated without limit.

ARCH 7976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

ARCH 7978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ARCH 7996. Thesis Continuation. 0 Hours.
Offers thesis supervision by members of the department.
ARMY 2211. Leadership and Decision Making Lab. 0 Hours.
Accompanies ARMY 2201. Introduces basic soldier skills and squad-level tactical operations in leadership lab. Includes participation in physical fitness training.

ARMY 2212. Army Doctrine and Team Development Lab. 0 Hours.
Accompanies ARMY 2202. Introduces basic soldier skills and squad-level tactical operations in leadership lab. Includes participation in physical fitness training.

ARMY 3301. Training Management and the Warfighting Functions. 4 Hours.
Focuses on training management and the warfighting functions. Constitutes an academically challenging course where the cadet is required to study, practice, and apply the fundamentals of training management and how the Army operates through the warfighting functions. At the conclusion of this course, the successful cadet should be capable of planning, preparing, and executing training for a squad conducting small-unit tactics. Requires students to apply their knowledge and leadership competencies outside the classroom in a hands-on performance-oriented environment during leadership labs and other field activities (team-building exercises, leadership development exercises). Requires prior completion of ARMY 1101, ARMY 1102, ARMY 2201, and ARMY 2202 or equivalent military experience.

ARMY 3302. Applied Leadership in Small Unit Operations. 4 Hours.
Focuses on applied leadership in small-unit operations. Constitutes an academically challenging course where the cadet is required to study, practice, and apply the fundamentals of direct-level leadership and small-unit tactics at the platoon level. At the conclusion of this course, the successful cadet should be capable of planning, coordinating, navigating, motivating, and leading a platoon in the execution of a mission. Seeks to prepare the cadet for the ROTC Cadet Leader Course (CLC), which the cadet attends in the summer at Fort Knox, KY. Requires students to apply their knowledge and leadership competencies outside the classroom in a hands-on performance-oriented environment during leadership labs and other field activities (team-building exercises, leadership development exercises). Requires prior completion of ARMY 1101, ARMY 1102, ARMY 2201, and ARMY 2202 or equivalent military experience.

ARMY 3311. Training Management and the Warfighting Functions Lab. 0 Hours.
Accompanies ARMY 3301. Introduces basic soldier skills and introduces squad-level tactical operations in leadership lab. Includes participation in physical fitness training.

ARMY 3312. Applied Leadership in Small Unit Operations Lab. 0 Hours.
Accompanies ARMY 3302. Introduces basic soldier skills and introduces squad-level tactical operations in leadership lab. Includes participation in physical fitness training.

ARMY 3503. American Military History. 4 Hours.
Focuses on the employment of the armed forces while examining the underlying factors that affected warfare, starting in the seventeenth century. Begins with European warfare and concludes with the issues facing the United States military today. Provides significant coverage of military operations and innovations to warfare. Encourages new ideas, thoughts, and creative discussion from students. ROTC students are expected to register concurrently for ARMY 3513.

ARMY 3504. Contemporary Army Operations. 2 Hours.
Introduces the roles and organization of the United States Army's Active, Reserve, and National Guard components. Uses these concepts as building blocks to discuss United States Army doctrine and tactics, and examines recent and ongoing military operations around the world. ROTC students are expected to register concurrently for ARMY 3514.

ARMY 3513. American Military History Lab. 0 Hours.
Offers a leadership lab introducing basic soldier skills and squad-level tactical operations.

ARMY 3514. Contemporary Army Operations Lab. 0 Hours.
Offers a leadership lab introducing basic soldier skills and squad-level tactical operations.

ARMY 4011. The Army Officer. 4 Hours.
Focuses on development of the Army officer. Constitutes an academically challenging course where the cadet has an opportunity to develop knowledge, skills, and abilities to plan resources and assess training at the small-unit level and to learn about Army programs that support counseling subordinates and evaluating performance, values, and ethics; career planning; and legal responsibilities. At the conclusion of this course, the successful cadet should be familiar with how to plan, prepare, execute, and continuously assess the conduct of training at the company or field-grade officer level. Requires students to apply and refine their leadership competencies as they develop and plan outside the classroom in hands-on performance-oriented environments during leadership labs and other field activities (team-building exercises, leadership development exercises).

ARMY 4012. Mission Command and the Company Grade Officer. 4 Hours.
Offers cadets an opportunity to develop knowledge, skills, and abilities required of junior officers pertaining to the Army in unified land operations and company-grade officer roles and responsibilities. Includes small-group assignments, briefings, case studies, practical exercises, and an oral practicum. The oral practicum explores the cadet's knowledge of preparation for the 20 Army warfighting challenges covered throughout the advanced course. Seeks to assist the cadet in preparing for the BOLCB course and is a mandatory requirement for commissioning. Requires students to apply and refine their leadership competencies as they develop and plan outside the classroom in hands-on performance-oriented environments during leadership labs and other field activities (team-building exercises, leadership development exercises).

ARMY 4401. Developing Adaptive Leaders. 4 Hours.
Develops student proficiency in planning and executing complex operations, functioning as a member of a staff, and mentoring subordinates. Students explore training management, methods of effective staff collaboration, and developmental counseling techniques. ROTC students are expected to register concurrently for ARMY 4411.

ARMY 4402. Leadership in a Complex World. 4 Hours.
Covers case study analysis of military law and practical exercises on establishing an ethical command climate. Students complete a semester-long Senior Leadership Project that requires them to plan, organize, collaborate, analyze, and demonstrate their leadership skills. ROTC students are expected to register concurrently for ARMY 4412.

ARMY 4411. The Army Officer Lab. 0 Hours.
Introduces basic soldier skills and squad-level tactical operations in leadership lab. Includes participation in physical fitness training.

ARMY 4412. Mission Command and the Company Grade Officer Lab. 0 Hours.
Introduces basic soldier skills and squad-level tactical operations in leadership lab. Includes participation in physical fitness training.
ART 0904. Plein Air Painting in Pastels. 6.8 Hours.
Encourages K–12 art educators to expand their knowledge and explore painting with pastel. Pastels are a wonderful medium for painting en plein air. Demonstrations and discussions offer students an opportunity to explore pastel while developing their own style, followed by daily critiques. Discussions focus on the role artists have in working with the environment. Art teachers can use lessons to teach students about the influence artists have in promoting public awareness of preserving wildlife and the environment. Connections are made to the Massachusetts Frameworks, including lesson plans and assessment.

ART 0906. Earth Sculptures: Working with Tides and Time. 6.8 Hours.
Focuses on the creation of artworks that have no negative impact on the environment in which they are a part. Uses films and short slide presentations as catalysts toward the creation of exciting environmental works in two, three, and four dimensions. Covers works by numerous environmental artists such as Andy Goldsworthy, Ana Mendieta, Christo and Jeanne-Claude, Mel Chin, Steven Siegel, Robert Smithson, and Nils-Udo, among others.

ART 0907. Abstract Painting. 6.8 Hours.
Offers students an opportunity to work in a variety of media, including pencil, charcoal, watercolor, acrylics, wax, and oils. Invites students to consider the interrelations of realism, abstraction, and nonrepresentational painting. Begins by focusing on a realistic painting and, through a variety of steps, demonstrates how to transform this work into an abstraction. From the abstract painting, students have an opportunity to take the next steps into nonrepresentational work. Encourages students to explore the connections of their own evolving work to the Massachusetts Department of Education Frameworks.

ART 0908. Explore Drawing and Printmaking. 6.8 Hours.
Offers students an opportunity to explore and develop an understanding of how to conceptualize, compose, and produce two-dimensional finished works in a variety of drawing and printmaking techniques such as oil pastel, ink wash, and traditional dry-media drawing, as well as collagraph, monoprint, and alternative-plate etching. The course is structured around miniprojects that allow the student to experiment with a given technique but culminate in a final, self-designed project in either media.

ART 0910. Narrative Ceramic Boxes. 6.8 Hours.
Offers students an opportunity to develop a facility in a variety of hand-building techniques using the box form. In connecting to the 10,000-year heritage of making pots based on containers, students study and apply forming and finishing techniques and develop a critical vocabulary and way of thinking about ceramic forms. Features daily demonstrations of hand-building techniques. Explores the full range of possibilities in creating functional, decorative, and narrative boxes.

ART 0920. Harmonious Color Mixing. 6.8 Hours.
Focuses on color and value and how these elements interact with each other to make an expressive statement in a painting. Working in the medium of choice—watercolor, acrylics, water mixable oils, and traditional oils—offers participants an opportunity to embark on a journey of making a passionate personal statement in their paintings with a unique approach to color mixing to create beautiful, harmonious paintings. Scenic natural locale serves as inspiration. This approach may be helpful to the participant as an artist and as an art teacher and may be an important tool for teaching art at the K–12 level.

ART 0926. Color Theory and Beyond: Understanding and Perceiving Color. 6.8 Hours.
Explores the powerful role that color plays in painting en plein air. Discusses the properties of color and how to create harmonies using various color schemes, such as complementary, monochromatic, and triadic, in order to achieve atmospheric perspective. Explores the impact exciting color has on a painting and the importance of colorful underpainting, the interaction of warm and cool colors, and the power of complementary colors. References the Massachusetts Curriculum Frameworks in order to make connections to classroom experiences and is designed for all levels of experience.
ART 0927. Contemporary Art Encounters. 6.8 Hours.
Introduces contemporary ideas in the arts through visiting contemporary visual art, theatre, and dance events and venues to better understand relationships between contemporary art and contemporary life. Discusses hands-on art activities and personal responses to the concepts reflected in the works visited. The objective is that, by the end of the course, participants should be better able to plan ways to integrate contemporary art into their teaching by identifying themes, approaches, and techniques utilized by contemporary artists. Offers participants an opportunity to develop a plan for incorporating contemporary art into their classrooms within the context of the Massachusetts Curriculum Frameworks.

ART 0929. Plein Air Landscape: The Color of Light and Shadow. 6.8 Hours.
Examines the colors the sun emits and how that light interacts with all parts of the landscape, including shadows. Landscape painters are always challenged by introducing sunlight into their paintings and struggle with the use of value and color relationships to achieve those results. Painting on location is about the simplification of the subject as well as the quick, spontaneous individual interpretation of the landscape. Focusing on small, plein air paintings in both morning and evening and then using these quick sketches as a jumping-off point for the further development of larger paintings is the dominant theme. Discusses how to integrate this effect into the art classroom by making connections with the Massachusetts Curriculum Frameworks.

ART 1101. Introduction to Art. 3 Hours.
Introduces the language of the visual arts with an emphasis on style, techniques, and content in painting, sculpture, graphic arts, and architecture. Includes slide lectures, discussions, and student visits.

ART 1145. American Cinema. 3 Hours.
Explores the uniquely distinguishing characteristics of American cinema. Covers camera angles, lighting, editing, sound, acting, narrative structure, and construction of point of view. Analyzes such recurring concerns of American cinema as the individual and community, issues of masculinity and violence, urban alienation, uprootedness, and adolescence.

ART 1200. Digital Photography. 3 Hours.
Designed to acquaint the beginner with the use of digital tools to manipulate and create digital imagery. Offers students an opportunity to learn to create a 360-degree panoramic photograph, digital slideshows, photographs for the web, and advanced techniques for negative scanning and advanced RAW file manipulation. Requires weekly assignments, demonstrations, hands-on experience, and a final portfolio. Students must supply their own 4-megapixel or greater camera. Intended as an entry-level course for visual artists and amateur photographers who wish to learn to express themselves using digital imaging.

ART 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ART 2000. Typography: Communicating Content with Form. 3 Hours.
Offers students an opportunity to obtain an understanding of effects produced by fonts and typographic techniques used in contemporary visual design. Uses computer-based graphic design software to present a historical overview of typography and to explore formal qualities of characters and typefaces through applied projects. Seeks to guide students' understanding of how successful graphic design that includes letters and words depends on clear and appropriate typography to express and communicate information.

ART 2100. Foundation in Visual Communication. 3 Hours.
Offers students an opportunity to gain knowledge of the fundamental elements of 2D design in order to explore the concept of pictorial order and to understand the principles of organization and form of elements of 2D design as communication tools.

ART 2200. Fundamentals of Computer Graphics and Desktop Publishing. 3 Hours.
Introduces the terminology, concepts, and applications of computer graphic software, including vector-based, raster-based, page layout, and PDF (Portable Document Format) creation programs. Offers students an opportunity to formulate and implement applications of computer graphics through assignment projects. Explores options available to students when creating files, along with advantages and limitations of graphic software and computers as design and production tools.

ART 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ART 3100. Visual Foundations: Color. 3 Hours.
Explores the transient nature of color by studying properties of, and relationships between, colors. Uses class work and projects to examine major theories and laws of color, its harmonies, special characteristics, color psychology, symbolism, and orchestration as these concepts apply to communication goals. Also studies the psychology of color and current trends in communication usage. Offers students an opportunity to discover their intuition for color and to develop its application in art and design.

ART 3110. Electronic Publishing and Design. 3 Hours.
Applies digital publishing tools to the solving of communication problems in a selected area of publishing. Focuses on an area of current importance in digital publishing and explores that area through individual projects. Offers students an opportunity to use page layout programs to create documents and to learn the correct procedure to import from various graphic programs, apply design and page layouts, and use typography. Discusses hardware options, output options, and management issues of actual publications.

ART 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ART 4100. Graphic Communication 1. 3 Hours.
Builds on students' understanding of elements of design, spatial relationships, typography, and imagery. Guides development of graphic design skills using traditional and digital tools, along with materials and procedures employed in the communication arts industry. Offers students an opportunity to learn to solve problems in graphic design, including typographic and pictorial elements and their integration with verbal content to communicate ideas.

ART 4110. Graphic Communication 2. 3 Hours.
Continues the examination of elements of design, spatial relationships, typography, and imagery. Offers students an opportunity to engage in creative work in graphic design with an emphasis on design concepts for client presentations. Explores effective problem-solving techniques by taking a variety of projects from concept to finished presentation. Introduces students to operating procedures in the art department, design studio, and printing plant.
ART 4120. Advertising Design. 3 Hours.
Studies principles and concepts of layout and design as applied to a variety of advertising and graphic design assignments such as ads, brochures, logos, posters, book jackets, and sales promotion material. Offers students an opportunity to obtain an understanding of marketing fundamentals and issues for different media. Presents creative work in advertising research analysis, layout, and preparation of client presentations. Covers advanced concepts and design principles used in planning visualizations and layouts for advertising and editorial presentations using art, photography, type, color, and illustrations.

ART 4896. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major.

ART 4950. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

ART 4955. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ART 4983. Topics. 1-4 Hours.
Covers special topics in visual arts. May be repeated without limit.

ART 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ART 4991. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

ART 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ART 4993. Independent Study. 1-4 Hours.
Offers students the opportunity to undertake special research.

ART 4994. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

ART 4995. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

ART 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ART 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ART 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

ART 6501. Landscape Painting. 4 Hours.
Designed for intermediate and beginning painters. Explores landscapes, urbanscapes, and seascapes. Participants use acrylic, water mixable, and traditional oil paints. Includes daily critiques, demonstrations, and discussions. Local history is a daily topic. Discusses “art vocabulary” that is useful in the classroom when assessing student art, including the use of an art rubric and the connection to the Massachusetts Art Frameworks. Further development of drawing and seeing skills is ongoing, as is the study of color and composition.

ART 6504. Plein Air Painting in Pastels. 4 Hours.
Encourages K–12 art educators to expand their knowledge and explore painting with pastel. Pastels are a wonderful medium for painting en plein air. Demonstrations and discussions offer students an opportunity to explore pastel while developing their own style, followed by daily critiques. Discussions focus on the role artists have in working with the environment. Art teachers can use lessons to teach students about the influence artists have in promoting public awareness of preserving wildlife and the environment. Connections are made to the Massachusetts Frameworks, including lesson plans and assessment.

ART 6505. Faces and Figures. 4 Hours.
Designed for all levels of art instructors. Offers students an opportunity to explore and develop an understanding of how to render the human face and figure in oil paint. Begins from square one but moves quickly into more advanced techniques. As a means of connecting artistic practice to classroom instruction, discusses the Massachusetts state art standards and how they apply to the process used in this class. Also addresses assessment of those standards using specifically designed rubrics.

ART 6506. Earth Sculptures: Working with Tides and Time. 4 Hours.
Focuses on the creation of artworks that have no negative impact on the environment in which they are a part. Uses films and short slide presentations as catalysts toward the creation of exciting environmental works in two, three, and four dimensions. Covers works by numerous environmental artists such as Andy Goldsworthy, Ana Mendieta, Christo and Jeanne-Claude, Mel Chin, Steven Siegel, Robert Smithson, and Nils-Udo, among others.

ART 6507. Abstract Painting. 4 Hours.
Offers students an opportunity to work in a variety of media, including pencil, charcoal, watercolor, acrylics, wax, and oils. Invites students to consider the interrelations of realism, abstraction, and nonrepresentational painting. Begins by focusing on a realistic painting and, through a variety of steps, demonstrates how to transform this work into an abstraction. From the abstract painting, students have an opportunity to take the next steps into nonrepresentational work. Encourages students to explore the connections of their own evolving work to the Massachusetts Department of Education Frameworks.

ART 6508. Explore Drawing and Printmaking. 4 Hours.
Offers students an opportunity to explore and develop an understanding of how to conceptualize, compose, and produce two-dimensional finished works in a variety of drawing and printing techniques such as oil pastel, ink wash, and traditional dry-media drawing, as well as collagraph, monoprint, and alternative-plate etching. The course is structured around miniprojects that allow the student to experiment with a given technique but culminate in a final, self-designed project in either media.

ART 6509. Creating Art with Mixed Media. 4 Hours.
Offers students an opportunity to explore a variety of mixed-media techniques through hands-on activities. Explores the use of mixed-media and collage techniques through demonstrations and discussion while providing an opportunity for students to develop their own style. Time is provided for creating works of art and keeping personal art journals.

ART 6510. Narrative Ceramic Boxes. 4 Hours.
Offers students an opportunity to develop a facility in a variety of hand-building techniques using the box form. In connecting to the 10,000-year heritage of making pots based on containers, students study and apply forming and finishing techniques and develop a critical vocabulary and way of thinking about ceramic forms. Features daily demonstrations of hand-building techniques. Explores the full range of possibilities in creating functional, decorative, and narrative boxes.
ART 6511. Institute in Art. 4 Hours.
Offers students an opportunity to identify and analyze content, curriculum, and instruction in the light of current research; to identify problems and design and implement solutions to such problems; to evaluate and field-test various curriculum approaches; and to apply new knowledge and skills to classroom practice.

ART 6512. Black-and-White Photography. 4 Hours.
Offers students an opportunity to gain experience in all aspects of black-and-white photography, including how to use the basic camera controls, the fine points of metering, exposure and development of film, and creative composition and camera techniques. Supplements technical information with critique and discussion of selected famous photographic images.

ART 6513. Finding Your Visual Voice: An Exploration. 4 Hours.
Offers students an opportunity to work in a variety of two-dimensional materials to embark on an exploration of how to bring a more personal voice and their own feelings to a representational or abstract approach. Focuses on developing an individual line of inquiry, a personal authenticity, and maximizing the use of intuition in making art, regardless of whether the subject comes from outside or inside themselves.

ART 6514. Ceramic Vessels with Attitude: Exploring Narrative Forms. 4 Hours.
Offers students an opportunity to explore historical and contemporary narrative through hand-building and decorative techniques in clay. From Grecian urns to Chinese hill jars to Peruvian stirrup bottles, clay artists have been telling the stories of their lives and communities through the 10,000 years of ceramic history. Explores the historical objects as inspiration for personal stories.

ART 6515. Boston through the Arts. 4 Hours.
Offers students an opportunity to explore inspiring landscapes and cityscapes in and around the Northeastern University campus through the use of watercolors, water mixable, and traditional oil paints. Examines atmospheric perspective, as well as one-, two-, and three-point linear perspective.

ART 6516. Landscapes and Cityscapes. 4 Hours.
Offers students an opportunity to explore inspiring landscapes and cityscapes in and around the Northeastern University campus through the use of watercolors, water mixable, and traditional oil paints. Examines atmospheric perspective, as well as one-, two-, and three-point linear perspective.

ART 6517. Improvisation and the Art of the Harlem Renaissance. 2 Hours.
Offers students an opportunity to learn through listening, observing, improvising, and creating to become familiar with voices, sounds, rhythms, and improvisations found in music, poetry, and prose from the Harlem Renaissance. Uses videos, photographs, books, and artwork to examine the history, heritage, and contributions of artists from this time and place. Using this information as a touchstone, explores personal stories, sites, and situations through the use of color, line, rhythm, texture, light, sound, words, and movement.

ART 6518. Landscape to Abstract Painting. 4 Hours.
Offers students an opportunity to move from representational landscape to abstraction and to use the painting medium of their choice to explore the connections between representational landscape images and abstract and nonrepresentational expressions. Provides a variety of 2D materials from charcoal to mixable oils. Taking advantage of the seasonal New England weather, students begin with plein air landscapes. At the end of each class, students are encouraged to critique their work and discuss adaptations to their K–12 classroom art curriculum. One goal of the course is that, when the course ends, students have a body of work comprised of landscape and abstract paintings.

ART 6522. The Art of Illustration: Communicating a Vision. 4 Hours.
Examines illustration, an art that visually communicates ideas and feeling to its audience. Designed to allow participants to envision how this learning experience transfers to the classroom. Teaching strategies such as viewing examples of professional works, completing projects with a focus on process, and participating in informal critiques seek to positively impact participants’ artwork and educational practices. References the Massachusetts Curriculum Frameworks throughout the course. Encourages participants to design a lesson based on the illustrative process.

ART 6523. Painting with Passion. 4 Hours.
Offers a workshop-format immersion art experience that explores landscapes and seascapes. Emphasizes supporting individuals in developing a personal line of inquiry and working toward the development of individual forms of expression in their work. Designed for people with a wide range of experience from beginners to advanced. References the Massachusetts Curriculum Frameworks in order to connect to classroom experience.

ART 6524. Taking a Painterly Approach. 4 Hours.
Offers students an opportunity to use pastel, acrylic, or oils to capture picturesque landscapes. Provides an opportunity to record an emotional response to the landscape and to move toward achieving a looser, more painterly approach while painting en plein air. Explores how to translate this approach to students in the classroom.

ART 6526. Color Theory and Beyond: Understanding and Perceiving Color. 4 Hours.
Explores the powerful role that color plays in painting en plein air. Discusses the properties of color and how to create harmonies using various color schemes, such as complementary, monochromatic, and triadic, in order to achieve atmospheric perspective. Explores the impact exciting color has on a painting and the importance of colorful underpainting, the interaction of warm and cool colors, and the power of complementary colors. References the Massachusetts Curriculum Frameworks in order to make connections to classroom experiences and is designed for all levels of experience.

ART 6527. Contemporary Art Encounters. 4 Hours.
Introduces contemporary ideas in the arts through visiting contemporary visual art, theatre, and dance events and venues to better understand relationships between contemporary art and contemporary life. Discusses hands-on art activities and personal responses to the concepts reflected in the works visited. The objective is that, by the end of the course, participants should be better able to plan ways to integrate contemporary art into their teaching by identifying themes, approaches, and techniques utilized by contemporary artists. Offers participants an opportunity to develop a plan for incorporating contemporary art into their classrooms within the context of the Massachusetts Curriculum Frameworks.

ART 6529. Plein Air Landscape: The Color of Light and Shadow. 4 Hours.
Examines the colors the sun emits and how that light interacts with all parts of the landscape, including shadows. Landscape painters are always challenged by introducing sunlight into their paintings and struggle with the use of value and color relationships to achieve those results. Painting on location is about the simplification of the subject as well as the quick, spontaneous individual interpretation of the landscape. Focusing on small, plein air paintings in both morning and evening and then using these quick sketches as a jumping-off point for the further development of larger paintings is the dominant theme. Discusses how to integrate this effect into the art classroom by making connections with the Massachusetts Curriculum Frameworks.
ART 6920. Harmonious Color Mixing. 4 Hours.
Focuses on color and value and how these elements interact with each other to make an expressive statement in a painting. Working in the medium of choice—watercolor, acrylics, water mixable oils, and traditional oils—offers participants an opportunity to embark on a journey of making a passionate personal statement in their paintings with a unique approach to color mixing to create beautiful, harmonious paintings. Scenic natural locale serves as inspiration. This approach may be helpful to the participant as an artist and as an art teacher and may be an important tool for teaching art at the K–12 level.

ART 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

ART 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ART 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

ART 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

ART 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

ART 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

ART 6983. Topics. 1-4 Hours.
Covers special topics in visual arts. May be repeated without limit.

ART 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ARTG 1250. Design Process Context and Systems. 4 Hours.
Explores common design practices, principles, and vocabularies, introducing the design process as a method of inquiry and problem solving through studio projects. Emphasizes the importance of an awareness of audience and context in the creation of meaningful communications and experiences. Explores the practice of design as an iterative process, offering students an opportunity to obtain an understanding of the value of systems thinking and the importance of feedback and exchange as a means for assessing the quality of design’s effectiveness in helping users achieve their goals.

ARTG 1255. Design Process Context and Systems Abroad. 4 Hours.
Explores common design practices, principles, and vocabularies, introducing the design process as a method of inquiry and problem solving through studio projects. Emphasizes the importance of an awareness of audience and context in the creation of meaningful communications and experiences. Explores the practice of design as an iterative process, offering students an opportunity to obtain an understanding of the value of systems thinking and the importance of feedback and exchange as a means for assessing the quality of design’s effectiveness in helping users achieve their goals. Taught abroad. May be repeated without limit.

ARTG 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTG 2250. Typography 1. 4 Hours.
Introduces typography as the basis of graphic design and visual communication. Guides students through an understanding of letterforms, words, sentences, and text as both image and information. Studies form, context, and visual meaning. Introduces use of the typographic grid and issues of hierarchy and legibility through assigned projects, readings, and lectures. Includes the historical evolution of typefaces and their classification as a rational system.

ARTG 2251. Type Tools. 1 Hour.
Offers students an opportunity to acquire technical software skills used in typesetting, such as Adobe InDesign, in this introductory lab.

ARTG 2252. Graphic Design 1. 4 Hours.
Explores graphic form and vocabulary through the development of icons and symbols. Applies graphic design principles to the correlation of forms with their function, content, and context. Incorporates a variety of media as visual communication elements.

ARTG 2260. Programming Basics. 4 Hours.
Explores student to basic programming design for user interfaces. Offers students an opportunity to become familiar with the logical elements of programming languages. Through lectures, hands-on in-class exercises, and modular projects, explores Web-based design and programming solutions for managing interaction and animation.

ARTG 2300. Business Literacy for Design and Media. 4 Hours.
Provides students with a toolkit that offers insight into how companies operate, what their managements do, and how success is measured. Exposes students to creative rights issues and professional paths they might pursue—employee, freelancer, and entrepreneur. Evaluates various company cultures and offers students an opportunity to assess their personal career fit.

ARTG 2400. Interaction Design 1: Responsive. 4 Hours.
Applies information design principles to Web and mobile interface design. Explores user-centered interface and programming design strategies for the delivery of responsive data-driven websites. Discusses audience definition, content development, information structuring, and navigation. Emphasizes tools and strategies for design, such as site maps, wireframes, prototypes, usability testing, and iterative development. Offers students an opportunity to obtain meaningful interactive experiences through team-based projects.

ARTG 2401. Interaction Design Tools. 1 Hour.
Introduces skills and software used in designing and developing Web-based interactive environments. Explores Web-page scripting and tagging, CSS-based design coding, options for front- and back-end page design connections, and alternative technologies.

ARTG 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTG 3250. Physical Computing. 4 Hours.
Explores the communication between the physical world and the interactive, computer-based interface. Examines the potential of reactive analog and digital devices embedded within the physical realm. Offers students an opportunity to use simple kit sensors and indicators designed to enable student teams to create interfaces triggered by gesture, bodily movement, physical forces, and other tangible actions. Concludes with discussions of more complex interactive devices, the relationship between physical computing and robotics, and possible future directions.
ARTG 3350. Typography 2. 4 Hours.
Continues ARTG 2250, exploring structures and hierarchies through increasing typographic complexity. Investigates meaning, legibility, and readability with an emphasis on voice, organization, sequence, and the typographic grid.

ARTG 3351. Time-Based Design. 4 Hours.
Introduces principles of time-based media—such as anticipation, interval, succession, and rhythm—through a series of analog and digital projects. Explores the potential of communicating information over time with a focus on kinetic typography and visual/sonic narratives. Examines concepts from film, music, and other related time-based arts through assignments, lectures, and student presentations.

ARTG 3450. Graphic Design 2. 4 Hours.
Investigates the range of conceptual possibilities inherent in the merging of words/text with images/symbols through the understanding of how their relationship can enhance meaning and comprehension. Explores visual poetry, choices in mark and form, and applied semiotics through projects, readings, and lectures/discussions.

ARTG 3451. Information Design 1. 4 Hours.
Introduces basic concepts, methods, and procedures of information design with a focus on mapping information. Students investigate visual systems and information structures such as maps, graphs, charts, and diagrams. Emphasizes the creative process of organizing, visualizing, and communicating data by making complex information easier to understand and use.

ARTG 3460. Identity and Brand Design. 4 Hours.
Addresses the origins, significance, and consequence of identity and branding expressions, in diverse media, in terms of personal, cultural, and commercial values. Using design research and studio methods, a series of exercises explores expressions of individual and collective identity. Offers students an opportunity to work in teams to develop branding projects in a process designed to increase their capacity to create effective brand expressions and analyze semiotic significance and cultural and economic value. Critique of work and presentation of concepts of identity and brand seek to sharpen students’ skills and challenge their ideas about brand. External critique seeks to create valuable tests of bias and assumptions, while principles of managing attention and trust seek to build the ability to function as a brand steward in actual practice.

ARTG 3461. Service Design. 4 Hours.
Addresses the challenges and opportunities in designing human-centered, memorable services. Uses case studies from diverse industries such as healthcare, transportation, banking, and retail. Introduces research and design methods such as scenario mapping, prototyping, and service enactment as means to observe and craft touchpoints throughout the service experience.

ARTG 3462. Experience Design 1. 4 Hours.
Investigates a wide range of design research methods and means of representing user intentions and actions in order to develop coherent designs based on the needs of the user. Includes use of context assessment, user experience audits, and scenario development as means to understand the motivations, behaviors, and values of audiences and participants.

ARTG 3463. Experience Design 2. 4 Hours.
Continues ARTG 3462 processes and strategies for creating compelling human-centered experiences. Offers students an opportunity to use design processes from multiple disciplines to develop real-world solutions.

ARTG 3465. Experience Design 1 Abroad. 4 Hours.
Investigates a wide range of design research methods and means of representing user intentions and actions in order to develop coherent designs based on the needs of the user. Includes use of context assessment, user experience audits, and scenario development as a means to understand the motivations, behaviors, and values of audiences and participants. Taught abroad. May be repeated without limit.

ARTG 3500. Transmedia Design. 4 Hours.
Examines how marketing, advertising, and media strategies developed across multiple media inform design and communication strategy. Topics include advertising narratives, brand development, management, and translation of branding across multiple media.

ARTG 3700. Interaction Design 2: Mobile. 4 Hours.
Explores user-centered interface design for information exchanges using handheld and mobile devices. Studies the potentials for leveraging both the social and locative possibilities of mobile devices through research, discussions, and project assignments.

ARTG 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTG 4500. Portfolio Workshop. 1 Hour.
Designed to provide guidance in defining criteria for professional presentation of art and design work, including considerations for portfolio organization and form. Lectures and discussions are designed to give an overview of best practices in the creation of digital as well as physical portfolios.

ARTG 4550. Design Degree Project 1. 4 Hours.
Draws on a range of theoretical and critical texts that address current issues and research methodologies in graphic design. This course is writing intensive and offers students an opportunity to complete weekly writing assignments and to visit local design studios, galleries, and museums. Writings and discussions are designed to lead to identification of a focus for ARTG 4551.

ARTG 4551. Design Degree Project 2. 4 Hours.
Forms the graphic design major capstone together with ARTG 4550. This intensive research-driven studio explores the realm of designing authorship. A single project theme extends in phases through an entire term to mirror the development sequence of complex professional design projects. Essential to the process is that the medium is not predetermined. Offers students an opportunity to investigate a topic of their choice, author and edit content, and determine the most effective medium for their message, which they design to resonate with a specific audience. Central to the course is a substantive written problem definition and proposal designed to integrate each student’s academic and design experience.

ARTG 4552. Information Design 2. 4 Hours.
Builds on concepts from ARTF 2223 and ARTG 3451. Offers students an opportunity to develop strategies for structuring and communicating complex information to increase understanding through dynamic states, which are controlled through the interaction of end users. Explores possibilities offered by interfaces that mediate between a person and information space through research, projects, readings, and discussions.

ARTG 4553. Environmental Design. 4 Hours.
Explores visual communication as experienced in the time-space continuum. Projects investigate social issues that contribute to shaping the concept of spaces, such as public art installations, interpretive exhibits, and wayfinding.

ARTG 4554. Typography 3. 4 Hours.
Offers an advanced course exploring a variety of typographical solutions, including expressive formal and complex content-based projects.
ARTG 4700. Interaction Team Degree Project 1. 4 Hours.
Offers the first course in a two-term capstone sequence. Offers students an opportunity to work in interdisciplinary teams to define, research, design, plan, and implement a large-scale interactive project. The project concept and preliminary work are completed in this course, and the final project is produced in ARTG 4701.

ARTG 4701. Interaction Team Degree Project 2. 4 Hours.
Continues ARTG 4700. Realizes the interactive project that was planned and designed in ARTG 4700.

ARTG 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTG 5100. Information Design Studio 1: Principles. 4 Hours.
Explores the theories and practices of information design through studio projects. Investigates visual systems and information structures such as maps, timelines, charts, and diagrams. Emphasizes the creative process of organizing, visualizing, and communicating data by seeking to make complex information easier to understand and use. Requires graduate standing or permission of program coordinator or instructor.

ARTG 5110. Information Design History. 4 Hours.
Investigates the history of visualization practices across disciplines and in relation to technology developments. Critically examines seminal visualizations in social, cultural, and technological contexts by means of discussions and writing activities in a seminar format. Requires graduate standing or permission of program coordinator or instructor.

ARTG 5120. Information Design Research Methods. 4 Hours.
Examines qualitative and quantitative research methods pertinent to information communication systems. Through discussion and writing activities, offers students an opportunity to investigate varied inquiry toward the development of researchable questions, argument formation, and assessment methodologies. Requires graduate standing or permission of program coordinator or instructor.

ARTG 5130. Visual Communication for Information Design. 4 Hours.
Explores graphic and typographic theory, principles, and practices. Introduces students to visual communication design with a primary focus on typography as the fundamental means of conveying content. Readings locate design and typography within the larger history of visual art and writing development. Covers methods of organizing content through hierarchy and spatial organization of grid structures. Considers relationships between positive and negative space, depth perception, transparency, and color theory. Requires graduate standing or permission of program coordinator or instructor.

ARTG 5300. Visual Cognition. 4 Hours.
Introduces human visual cognition as it applies to information design and visualization. Focuses on perception, attention, pattern recognition, information acquisition, memory, and creation of mental models. Explores reasoning, cognition, decision making, and problem solving in relation to visual artifacts. Requires graduate standing or permission of program coordinator or instructor.

ARTG 5320. Statistics Basics for Designers. 4 Hours.
Offers design students an opportunity to obtain the necessary skills to collect, summarize, analyze, and interpret data. Introduces concepts and methods in statistical reasoning and analysis. Topics include data mining, comparison, assessment, and delivery. Requires graduate standing or permission of program coordinator or instructor.

ARTG 5330. Visualization Technologies. 4 Hours.
Introduces programming languages that allow computational analysis and digital delivery of dynamic information. Examines implications of environmental and personal sensor data sources, mobile collection and analysis of data, real-time networked data sets, and social use of shared data visualization tools. May be repeated once.

ARTG 5600. Experience Design Studio 1—Principles. 4 Hours.
Explores a systems-based perspective on our environment by addressing questions that are fundamental to design practice: What is a system, and what are the different types? How do we observe, analyze, and represent systems? What interactions can we have with systems and what are the different types of interaction? Explores structures and processes for the design of systemic relationships between people, artifacts, environments, and activities. Systems may be physical, virtual, social, or a combination. Through discussion, writing, diagramming, and project exercises, offers students an opportunity to learn principles of systems theory and explore the connection between design methods and systems thinking. Undergraduate seniors admitted with permission of instructor.

ARTG 5610. Design Systems. 4 Hours.
Explores a systems-based perspective on our environment by addressing questions that are fundamental to design practice: What is a system, and what are the different types? How do we observe, analyze, and represent systems? What interactions can we have with systems and what are the different types of interaction? Explores structures and processes for the design of systemic relationships between people, artifacts, environments, and activities. Systems may be physical, virtual, social, or a combination. Through discussion, writing, diagramming, and project exercises, offers students an opportunity to learn principles of systems theory and explore the connection between design methods and systems thinking. Undergraduate seniors admitted with permission of instructor.

ARTG 5620. Notational Systems for Experience. 4 Hours.
Examines theoretical foundations, concepts, and methods of visual notational systems used in the effective analysis and communication of existing experiences and in the envisioning of conditions for future experiences. Notational systems are sets of graphic signs and codes that denote or prescribe specific actions, forces, operations, events, or performances that occur over time. Students engage with concepts and models through readings, discussion, case study analyses, and speculative design projects. Evaluates the role that notational systems play in documenting, analyzing, and understanding the human goals, actions, behaviors, and perceptions key to experience and assesses their value in designing for agency and new experiences. Undergraduate seniors admitted with permission of instructor. Understanding a design process and knowledge of studio critique practices recommended.

ARTG 6100. Information Design Studio 2: Dynamic Mapping and Models. 4 Hours.
Continues the exploration of data representations in a variety of media. Focuses on interactive and time-based techniques. Emphasizes computational methods of data collection, manipulation, and encoding. Requires graduate standing or permission of program coordinator or instructor. May be repeated once.

ARTG 6110. Information Design Theory and Critical Thinking. 4 Hours.
Examines various theoretical models of information visualization and delivery systems. Evaluates the concepts and effectiveness of the models through discussions and writing activities. Students who do not meet course prerequisites or restrictions may seek permission of program coordinator or instructor.
ARTG 6200. Information Design Studio 3: Synthesis. 4 Hours.
Continues the exploration of theories of information design and visualization through focused projects that are intended to lead to development of a thesis project. Requires graduate standing or permission of program coordinator or instructor.

ARTG 6310. Design for Behavior and Experience. 4 Hours.
Examines the potential of interfaces as mediators between information and users. Explores iterative prototyping and research methods to analyze patterns of behavior and implications of interface on effective communication. Utilizes observation, empathy, ethnography, and participatory design methods to offer students an opportunity to increase their understanding of audiences' and stakeholders' motivations and expectations. Requires graduate standing or permission of program coordinator or instructor.

ARTG 6320. Design of Information-Rich Environments. 4 Hours.
Explores methods of information organization, presentation, and navigation in physical space. Introduces concepts of wayshoming and embodiment and examines the bridging of physical and virtual spaces through the use of mobile and locative technologies. Encourages collaborative studio projects exploring interventions in public or urban environments and in exhibit-based learning environments. Undergraduate students may seek permission of instructor.

ARTG 6330. Information Design Mapping Strategies. 4 Hours.
Examines the relationships between content and context through mapping methods. Emphasizes the impact of geographic information systems, evolving technologies, community mapping tools, globalization, and delivery systems. Undergraduate students may seek permission of instructor.

ARTG 6900. Special Topics in Design. 4 Hours.
Explores focused research topics relevant to the graduate program curriculum. Undergraduate students may seek permission of program coordinator or instructor. May be repeated up to three times.

ARTG 7100. Information Design Thesis Seminar. 4 Hours.
Examines emerging research and critical practices in information design and visualization. Offers students an opportunity to develop the visual and verbal expression of the thesis through writing, discussion, presentation, and critique.

ARTG 7990. Thesis. 8 Hours.
Offers students an opportunity to develop and produce a written and project-based thesis that integrates and applies their accumulated knowledge to a specific real-world situation. Encourages student participation within a practice and research community consisting of classmates, advisor(s), and external professionals.

ARTG 7996. Thesis Continuation. 0 Hours.
Offers students continuing thesis supervision by members of the department.

Art - Fundamentals (ARTF)

ARTF 1000. Art and Design at Northeastern. 1 Hour.
Introduces students to the intellectual and extracurricular opportunities within the Department of Art + Design and the College of Arts, Media and Design. Exposes students to the cultural vibrancy of Boston with the goal of building networks that facilitate a supportive learning community. Familiarizes students with their major and introduces them to the resources at the university and across the city to help them succeed academically. Provides grounding in the culture and values of the university community and seeks to help students develop interpersonal skills.

ARTF 1102. Color 1 Foundation. 1 Hour.
Examines subtractive color. Introduces optical phenomena of color pigment, reflected color. Studies hue, value, and saturation and their implications for color interaction, legibility, and spatial illusion.

ARTF 1104. Color 2 Foundation. 1 Hour.
Focuses on the optical phenomena of color activity, legibility, and spatial illusion in traditional and electronic media as well as the differences between subtractive and additive color.

ARTF 1120. Observational Drawing. 4 Hours.
Focuses on developing an understanding of the structure of object and figure through freehand drawing. Offers students an opportunity to explore a wide range of materials, including wash, charcoal, and pencil.

ARTF 1121. Conceptual Drawing. 4 Hours.
Seeks to expand the student's knowledge and skills through a mark-making process. Offers students an opportunity to begin to understand the relationship between form and meaning while relating the drawing process to broader concepts of communication.

ARTF 1122. 2D Fundamentals: Surface and Drawing. 4 Hours.
Offers an opportunity to discover and research basic principles, language, and concepts inherent in two-dimensional visual systems. Offers students an opportunity to learn to think critically, analyze, and apply basic principles to design and art projects. In a studio workshop setting, three primary phases explore art, design, and photography.

ARTF 1123. 2D Tools. 1 Hour.
Introduces skills and software, such as Adobe Photoshop and Illustrator, used in creating and manipulating pixel- and vector-based images, in a technology workshop format.

ARTF 1124. 3D Fundamentals: Structure and Drawing. 4 Hours.
Continues ARTF 1122. Explores three-dimensional form. Examines principles including mass, volume, line, plane, and texture. Introduces basic materials and structure through constructing models and prototypes. Presents sequential exercises with simple eye/hand skills and form recognition. Explores complex projects that require an understanding of context, content, and developing original forms.

ARTF 1125. 3D Tools. 1 Hour.
Introduces skills and software used in creating 3D forms with the computer. Explores basics of 3D modeling, surfaceing, lighting, and rendering in this technology workshop.

ARTF 1140. Understanding Art. 4 Hours.
Offers an introduction to the characteristics of the visual arts including painting, sculpture, graphic arts, and architecture. Studies various examples of works of art as means of understanding style and techniques. Includes visits to museum collections and contemporary art galleries.

ARTF 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTF 2220. 4D Fundamentals: Sequence and Drawing. 4 Hours.
Explores time-based art and design in an introductory lecture/studio format. Introduces formal, narrative, and alternative concepts for creative time-based communication. Assignments investigate video, animation, and a mixture of media in a screen based context.

ARTF 2221. 4D Tools. 1 Hour.
Introduces skills and software used in animating 2D and 3D images, graphics, and forms. Explores the basics of key framing, layering, parenting, 3D modeling, surfaceing, and rigging in this technology workshop.
ARTF 2223. 5D Fundamentals: Experience and Drawing. 4 Hours. 
Explores the language of interactive experience as a compelling medium to communicate meaning. Examines how variables within the environment can change how we inhabit an experience physically, conceptually, and emotionally. Studies historical and contemporary examples of art and design projects designed as exchanges or experiences. Incorporates drawing as a means to understand the present and project potential future experiences.

ARTF 2224. 5D Tools. 1 Hour. 
Introduces skills and software used in creating basic Web-based content. This technology workshop introduces software using HTML and style sheets such as Adobe Dreamweaver.

ARTF 2990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTF 3990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTF 4990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTF 2223. 5D Fundamentals: Experience and Drawing. 4 Hours. 
Explores the language of interactive experience as a compelling medium to communicate meaning. Examines how variables within the environment can change how we inhabit an experience physically, conceptually, and emotionally. Studies historical and contemporary examples of art and design projects designed as exchanges or experiences. Incorporates drawing as a means to understand the present and project potential future experiences.

ARTF 2224. 5D Tools. 1 Hour. 
Introduces skills and software used in creating basic Web-based content. This technology workshop introduces software using HTML and style sheets such as Adobe Dreamweaver.

ARTF 2990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTF 3990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTF 4990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTF 1135. Visual Literacy. 4 Hours. 
Examines the ways we create, use, interpret, and analyze images within cultural contexts. Explores the power of visual imagery through readings, discussions, written assignments, and visual projects encouraging purposeful seeing.

ARTF 1990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

Offers eligible students an opportunity for practical experience. May be repeated without limit.

ARTF 2101. Introduction to Co-op. 1 Hour. 
Offers students an opportunity to explore the basics of cooperative education through a careful exploration of aspects of preparation, activity, and reflection—the core of the co-op learning model. Each week students are asked to delve into different areas of self-assessment, career exploration, goals setting, and skill building. Covers résumé and cover letter writing, interviewing, self-marketing, and brand identity as well as portfolio basics and how to use the University’s online listing of jobs and other services. Guests include professionals from Career Services and employers and alumni who seek to give students insights into various arts professions.

ARTF 2301. The Graphic Novel. 4 Hours. 
Explores the word-and-image relationship in a narrative form. Offers students an opportunity to learn how to read comics—and what they teach us about reading—in addition to the creative practices that go into making them. Examines antecedents including “engraved novels,” newspaper comic strips, “wordless novels,” underground comic books, and punk fanzines to understand the graphic novel’s rise in the 1970s. Explores current directions in production. Includes visits from artists to discuss the craft of this verbal-visual form. ARTE 2301 and ENGL 2301 are cross-listed.

ARTF 2500. Art and Design Abroad: Studio. 4 Hours. 
Offers an intensive studio course taken abroad and taught by an art and design faculty member. Exposure to regional artists, history, culture, museums, architecture, and physical geography provide focus of study and creative exploration. May be repeated without limit.

ARTF 2501. Art and Design Abroad: History. 4 Hours. 
Offers an intensive history course taken abroad and taught by an art history, design, or art faculty member. Exposure to regional and international artists, history, culture, museums, landscape architecture, galleries, material culture, and architecture provide a rich context for studying the history of art and design. Offers students an opportunity to understand narrative and visual components through detailed hands-on workshops and detailed creation of artistic formats, including design, text essays, photographic essays, temporary exhibitions, video art projections, and live performances as artifacts. May be repeated without limit.

ARTF 2990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTF 2995. Practicum. 1-4 Hours. 
Offers eligible students an opportunity for practical experience. May be repeated without limit.

ARTF 3901. Art and Design Special Topics. 4 Hours. 
Offers an art and design course in which format and content are determined by the instructor. May be repeated once.

ARTF 3902. Recitation for ARTE 3901. 0 Hours. 
Convenes for additional viewing, discussion, study, and project-based application of course content.

ARTF 3990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTF 3995. Practicum. 1-4 Hours. 
Offers eligible students an opportunity for practical experience. May be repeated without limit.

ARTF 4901. Special Topics in Art and Design Studio. 4 Hours. 
Offers an art and design studio in which format and content are determined by the instructor. May be repeated without limit.

ARTF 4902. Special Topics in Art and Design History. 4 Hours. 
Offers a seminar in art and design history in which format and content are determined by the instructor. May be repeated without limit.

ARTF 4970. Junior/Senior Honors Project 1. 4 Hours. 
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

ARTF 4971. Junior/Senior Honors Project 2. 4 Hours. 
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ARTF 4990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTF 4991. Research. 4 Hours. 
Offers an opportunity to conduct research under faculty supervision.

ARTF 4992. Directed Study. 1-4 Hours. 
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.
**ARTE 4994. Internship. 4 Hours.**
Offers students an opportunity for internship work. May be repeated without limit.

**ARTE 4995. Practicum. 1-4 Hours.**
Offers eligible students an opportunity for practical experience. May be repeated without limit.

**ARTE 4996. Experiential Education Directed Study. 4 Hours.**
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using it to fulfill their experiential education requirement. May be repeated without limit.

**ARTE 5901. Special Topics in Art and Design Studio. 4 Hours.**
Offers an opportunity for the intensive study of specialized themes in areas of research in studio and aesthetics related to art and design. Instructor determines format and content. May be repeated without limit.

**ARTE 6210. Research Methods for the Creative Arts. 4 Hours.**
Introduces major methodologies commonly used in contemporary, interdisciplinary creative practice. Emphasizes blended methods drawing on the humanities, qualitative social sciences, and design, such as the use of archival sources, visual and discursive analysis, interviews and participant observation, and human-centered and participatory design. Emphasizes questions of power and the ethical implications of creative work as framed through various theoretical lenses. Provides a venue for the design of a creative research project in support of the graduate thesis.

**ARTE 6211. Art Criticism by Artists. 4 Hours.**
Studies the writings of twentieth- and twenty-first-century artists about their art in relationship to their work. Considers artists ranging from Wassily Kandinsky to Robert Smithson to Adrian Piper as both critics of their work and as creators. Also considers how these roles interrelate.

**ARTE 6961. Internship. 1-4 Hours.**
Offers students an opportunity for internship work. May be repeated up to four times.

**ARTE 6962. Elective. 1-4 Hours.**
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

**ARTE 6964. Co-op Work Experience. 0 Hours.**
Provides eligible students with an opportunity for work experience. May be repeated without limit.

**ARTE 6966. Practicum. 1-4 Hours.**
Offers eligible students an opportunity for practical experience. May be repeated up to four times.

**ARTE 6976. Directed Study. 1-4 Hours.**
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated up to four times.

**ARTE 6984. Research. 1-4 Hours.**
Offers students an opportunity to conduct research under faculty supervision. May be repeated up to four times.

**ARTE 7100. Thesis Proposal. 4 Hours.**
Offers candidates an opportunity to select a topic and present a proposal for a topic of study/research to a faculty committee for approval. A definition of the scope of the project, the methodologies for the research, and the assumptions being questioned or analyzed are determined. The thesis research proposal must demonstrate the student’s ability to carry out sustained and independent research to develop critical and specialist knowledge of contemporary topics in a field related to public art. Research includes aspects of scholarship in some or all of the following: theory, semiotics, ontology, phenomenology, and social or critical approaches to cultural studies.

**ARTE 7990. Thesis. 4 Hours.**
Offers the candidate, working with a thesis advisor, an opportunity to continue to complete the research project defined and proposed in ARTE 7100. The research is carried out in an independent manner, with periodic presentations to the thesis committee. These presentations define the benchmarks for determination of successful progress in the project. The ultimate result is an exhibition, screening, performance, or other form of public display or presentation, together with a thesis paper or written corollary.

**ARTE 7996. Thesis Continuation. 0 Hours.**
Offers continued work on the thesis project.

---

**ARTH 1100. Interactive Media and Society. 4 Hours.**
Offers a critical historical survey of interactive media from analog to digital techniques and from physical to virtual spaces. Examines the social, ethical, and cultural impact of interactive media. Concludes with a study of current issues and directions in interactive media. Through weekly lectures, research projects, and critical analyses, offers students an opportunity to consider current and historical aspects of interactive media and design.

**ARTH 1110. Global Art and Design History: Ancient to Medieval. 4 Hours.**
Investigates the history of painting, sculpture, design, and related arts through a study of masterpieces from prehistoric times to the end of the Middle Ages. Offers students an opportunity to become familiar with specific works, styles, and terminology of art and design and to develop an ability to communicate about the visual arts.

**ARTH 1111. Global Art and Design History: Renaissance to Modern. 4 Hours.**
Explores the evolving history of painting, sculpture, design, and related arts through a study of masterpieces from the Renaissance to the present. Offers students an opportunity to become familiar with specific works, styles, and terminology of art and design and to develop an ability to communicate about the visual arts.

**ARTH 1210. Modern Art and Design History. 4 Hours.**
Surveys modernist movements from early to mid-20th century. Emphasizes the reciprocal evolution of art and design within cultural and social contexts.
ARTH 2211. Contemporary Art and Design History. 4 Hours.
Offers a study of contemporary culture in an art and design survey from mid-twentieth century to present. Presents a thematic approach to late-modern and postmodernist movements, focusing on interrelationships among media.

ARTH 2212. Survey of the Still and Moving Image. 4 Hours.
Examines the history of still and moving images in relationship to other artistic, documentary, and journalistic practices.

ARTH 2213. 19th-Century Art. 4 Hours.
Explores art from 1780 to 1900. Considers developments such as neoclassicism, romanticism, realism, impressionism, and symbolism in terms of major changes in society: industrialization, Parisian urbanism, photography, Japonisme, the status of women, and the institutions of art. Emphasizes French painting, but developments in Europe and the Americas are considered. Includes museum visits.

ARTH 2214. American Art. 4 Hours.
Surveys the history of American painting and sculpture. Explores the social and cultural forces as well as the aesthetic and intellectual concerns that shape the evolution of art in the United States. Includes visits to museums and galleries.

ARTH 2215. History of Graphic Design. 4 Hours.
Follows a chronological survey of graphic design from 4000 BC to the beginning of the 21st century, emphasizing work from 1880 to 2000, and the relationship of that work to other visual arts and design disciplines. Demonstrates how graphic design has responded to (and affected) international, social, political, and technological developments since 1450. Traces developments in the areas of typography and publication, persuasion, identity, information, and theory.

ARTH 2217. American Animation Film. 4 Hours.
Considers the history and influence of American animation as a once- and still-thriving form. Covers topics including the link between modernism and graphic-based animation, the paradigm shift from Disney to Warner Brothers and MGM during the “golden age” (1928–1958), the rise of underground comix and alternative animation of the 1960s–1970s, the status of animation in relation to live-action film (from avant-garde practices to slapstick comedy), the relationships between American and international animation, and the current revolution in CGI and television animation.

ARTH 2220. Recitation for ARTH 2210. 0 Hours.
Convenes for additional viewing, discussion, study, and project-based application of course content.

ARTH 2221. Recitation for ARTH 2211. 0 Hours.
Convenes for additional viewing, discussion, study, and project-based application of course content.

ARTH 2225. Recitation for ARTH 2215. 0 Hours.
Convenes for additional viewing, discussion, study, and project-based application of course content.

ARTH 2990. Elective. 1–4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTH 3990. Elective. 1–4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTH 4500. Arts of the African Diaspora. 4 Hours.
Traces the historical development of the art forms and production practices of the African Diaspora, from traditional to contemporary styles in Africa, the Americas, and elsewhere in the African Diaspora. Emphasizes the study of art objects, the historical and social context in which aesthetic issues are shaped, and the impact of religion and external forces on creativity. Uses lectures, critiques, discussions, fieldwork, and hands-on interaction with art objects.

ARTH 4990. Elective. 1–4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTH 5100. Contemporary Art Theory and Criticism. 4 Hours.
Introduces the major critical and philosophical approaches that have transformed the reception, interpretation, and production of contemporary art since the 1960s. Examines a range of key interpretive methodologies—including modernism, postmodernism, psychoanalysis, feminism, Marxism, poststructuralism and deconstruction, critical race theory, visual studies, and globalization—designed to provide practitioners with the means to critically frame their own art making within contemporary debates about the meaning and social functions of art.

ARTH 5200. Issues in Contemporary Art. 4 Hours.
Introduces the major artists, movements, and issues that have redefined contemporary art since the late twentieth century. Examines both critically and historiographically, topics such as conceptualism, earth art, appropriation, installation, street art, identity politics, activist art, performance, globalization, relational art, and new media. Offers an overview aimed at helping students negotiate the relationship between their own artistic practice and global art worlds.

ARTH 5300. Postmodernism: Theory and Practice in the Visual Arts. 4 Hours.
Surveys the emergence and evolution of postmodernism’s challenge to modernism through the work of theorists, critics, and visual artists. Explores recent claims that our current globalized and digitized era has generated a new, “post-postmodern” stage of cultural production. Requires students to develop an original intensive research topic, analyze methods of presentation, and present the topic in written form.

ARTH 5400. Contemporary Visual Culture. 4 Hours.
Explores the implications of the erosion of the traditional boundary between fine art and mass culture for artistic theory and practice as well as art’s place in an increasingly globalized world. Situates contemporary artistic practice within the broader context of visual culture—including film, television, advertising, architecture, and the Internet.

ARTH 5500. Art and New Media: History and Theory. 4 Hours.
Surveys the impact of the emergence and evolution of new media technologies on the production, circulation, and criticism of art in the late twentieth century and in the twenty-first century. Topics include video art, multimedia installation, digital photography, and Internet art, as well as the critical and theoretical frameworks that inspired and responded to them.

ARTH 5902. Special Topics in Art and Design History. 4 Hours.
Offers an opportunity for the intensive study of specialized themes in areas of research in art history, aesthetics, or critical studies. Format and content are determined by the instructor in this elective in Art + Design history. May be repeated once.
ARTH 6212. The History of the Avant-Garde. 4 Hours.
Examines the role of the artistic avant-garde from the mid-nineteenth
century to the present as it relates to established artistic institutions and
radical politics. Considers the most shocking and innovative art of the
last century as defined by critical and public response. Explores theories
of modernism as well as critiques of the avant-garde.

ARTH 6901. Special Topics in Contemporary Art. 1-4 Hours.
Offers an opportunity for the intensive study of specialized themes and
topics in the area of contemporary art history and criticism, such as
globalism, gender, identity politics, critical theory, and art in a museum
context. Topics vary each time it is offered and are announced in the
semester’s course listings. May be taken up to two times with unique
topics. May be repeated up to seven times for up to 8 total credits.

ARTH 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions.
May be repeated without limit.

ARTH 6976. Directed Study. 1-4 Hours.
Offers directed study of a specific topic not normally contained in the
regular course offerings but within the area of competence of a faculty
member. May be repeated without limit.

Art - Media Arts (ARTD)

ARTD 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions.
May be repeated without limit.

ARTD 2100. Narrative Basics. 4 Hours.
Explores narrative sequence and story development in a variety of story
architectures and media combinations, including text, video, music,
audio, and design. Uses lectures, in-class workshops, and collaborative
projects to expose students to the critical role of narrative in society and
interactive media, including games. Offers students an opportunity to
develop an interactive media design document over the second half of
the semester.

ARTD 2200. Interactive Narrative. 4 Hours.
Continues the study of narrative structures from ARTD 2100,
emphasizing analysis and development of interactive and experimental
new media applications. Offers students an opportunity to explore
narrative issues in immersive multimedia and gaming, including dynamic
characters and multiplayer environments. Students work in teams to
develop narrative continuity across multiple media, including alternate-
reality games and other forms of multimedia experiences.

ARTD 2350. Photo Basics for Nonmajors. 4 Hours.
Offers a basic photography course that introduces students to the use of
camera controls, computer-based image and file management systems,
lighting, and final printing. Additionally, books on demand, slide shows,
and image archiving are demonstrated and then explored by students.
No previous experience is necessary. Does not fulfill major or minor
requirements for students within the Department of Art + Design.

ARTD 2360. Photo Basics. 4 Hours.
Offers an introductory lecture/lab photography class. Explores
the technical and theoretical concepts throughout the history of
photography. The lab component of the course covers processing,
editing, and output of images. Culminates in a final project designed to
Demonstrate both technical and conceptual knowledge of the medium.

ARTD 2361. Photo Tools. 1 Hour.
Offers an introductory photography lab designed to enable the student
to acquire basic technical camera usage and digital capture. Explores
photographic image management applications.

ARTD 2370. Animation Basics. 4 Hours.
Offers an introductory studio course that explores the creative potential
of animation. Explores a variety of traditional animation
processes and techniques through lectures, demonstrations, and hands-
on assignments. Provides an historical survey of animation art through
the twentieth century. Emphasizes using the computer to develop
concepts creatively while learning the fundamental skills of constructing
animated images and forms.

ARTD 2371. Animation Tools. 1 Hour.
Introduces intermediate skills and software used in creating 3D
animation. Explores modeling, surfacing, lighting, key framing, and rigging
in this technology workshop.

ARTD 2380. Video Basics. 4 Hours.
Offers an introductory exploration into the moving image as an art form.
Covers the fundamental technical and aesthetic aspects of contemporary
video production. Emphasizes personal, experimental works from an
individual point of view. Analysis of projects is directed toward the
development of a personal voice.

ARTD 2381. Video Tools. 1 Hour.
Introduces intermediate skills and software used in capturing,
manipulating, and editing video and audio in this technology workshop.

ARTD 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions.
May be repeated without limit.

ARTD 3460. Photography 1. 4 Hours.
Continues ARTD 2360, spending significant time on idea generation
and research based on contemporary theoretical principles. Explores
digital capture and image management in conjunction with project
development. Requires a final project based on individual research and
the establishment of a concise point of view.

ARTD 3470. Animation 1. 4 Hours.
Introduces the fundamentals of three-dimensional computer animation.
Class lectures and demonstrations are followed by substantial hands-on
exploration. Students gain fundamental skills for modeling, surfacing, and
animating. Projects progress from creating simple geometric objects to
realistic organic characters. Basic systems for animating are introduced
and explored.

ARTD 3471. Virtual Environment Design. 4 Hours.
Utilizes elements of story and game play in the design of both 2D and
3D environments, integrating architecture, landscape, and set dressing.
Introduces real-time procedurally generated terrain and flora, asset
optimization, and nonlinear path finding. Explores content ranging from
historically accurate and contemporary hyperrealistic to stylized and
fanciful.

ARTD 3472. Character Design for Animation. 4 Hours.
Focuses on the development of characters as they relate to game design
and animation. Explores, through treatments and synopsis, theme-based
character back story, rationale, and visual design. Integrates learning
objectives of both 2D and 3D, optimized rigging, movement study, and
accessory and prop design.

ARTD 3473. Animation for Games. 4 Hours.
Explores all areas of 3D game asset creation—animation, modeling,
shading, effects, and their integration. Working in small groups, students
have an opportunity to learn how to construct animated assets that
work efficiently within a game programming environment. Encourages
students to specialize in at least one area of asset creation.
ARTD 3480. Video: Sound and Image. 4 Hours.
Continues the study of video as an art form. Focuses on the dynamic relationship between sound and the moving image. Begins with audio exercises exploring various aspects of sound design that are integrated into an in-depth video production. Emphasizes the production of innovative video art with powerful visual imagery, complex editing rhythms, and creative sound design.

ARTD 3485. Video Art. 4 Hours.
Constitutes an advanced video production and analysis course. Emphasizes the development of personal vision and building a working knowledge of contemporary video art techniques. Offers students an opportunity to expand conceptual ideas and visual language skills by interrogating concepts of time, movement, light, and space within their working process. Visual research and discussion supplement the studio work.

ARTD 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTD 4530. Media Arts Degree Project 1. 4 Hours.
Explores the criticism and theory associated with digital art. Offers students an opportunity to apply this knowledge to research in one of the digital media (photography, animation, and video) in preparation for completion of their degree project.

ARTD 4555. Photography 2. 4 Hours.
Continues ARTD 3460 with intensive project research based on specific theoretical principles chosen by the student. Explores various photographic formats, digital scanning, and Web usage. Requires a final written theoretical and visual project for successful completion of the course.

ARTD 4570. Animation 2. 4 Hours.
Continues ARTD 4570. Focuses on seamless integration of animated three-dimensional models with digital photographic backgrounds. Continued emphasis on building comprehensive modeling, surfacing, and animation skills. Students develop original content based on course objectives. Complex systems for creating realistic movement are introduced. Exposes students to compositing and animation processes through lectures, demonstrations, and hands-on assignments.

ARTD 4575. Animation 3. 4 Hours.
Continues ARTD 4570. Focuses on building comprehensive modeling, animation, and compositing skills in this advanced studio course. Students explore creating special effects through seamless mixture of computer-generated imagery and digital video footage. Advanced compositing and lighting techniques are introduced and explored. Students create original characters using organic modeling and surfacing techniques. Exposes students to animation and compositing processes through lectures, demonstrations, and hands-on assignments.

ARTD 4577. Digital Sculpture and Model Making. 4 Hours.
Focuses on the potential of sculpture and model making as a means of creative expression and for the communication of visual ideas. Offers students an opportunity to develop formal and technical skills for digital sculpting and the application of those skills for creating tangible models. Explores traditional and digital modeling techniques and utilizes 3D scanning and 3D printing techniques for physical model construction. Examines the historic role of model making and prototyping in the development and creation of fine art, game art, animation, and product design.

ARTD 4660. Studio Photography. 4 Hours.
Examines studio practices and lighting techniques. Offers students an opportunity to obtain a thorough understanding and working knowledge of contemporary practice in the photography studio. Includes comprehensive exercises and assignments with various types of lighting equipment.

ARTD 4661. Alternative Photographic Processes. 4 Hours.
Focuses on analog-based conventional black-and-white photography. Explores, demonstrates, and uses nineteenth- and twentieth-century photographic processes to explore alternative delivery systems for creative and professional applications.

ARTD 4670. Media Arts Degree Project 2. 4 Hours.
Continues ARTD 4530. Offers students an opportunity to research and produce a final semester project and a written thesis.

ARTD 4682. Video in Context: Video and Social Change. 4 Hours.
Offers students an opportunity to apply and refine video production skills to develop an advanced project of broad interdisciplinary significance. Introduces students to established and emerging media genres, advanced research and analysis, and activist video practices for project development. This is a hybrid lecture/studio course that incorporates screening with guest directors to consider a variety of theoretical and practical approaches to societal change and to the potential of video arts for a politics of visual representation, critical analysis, and empowerment.

ARTD 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTD 5001. Art, Context, Action 1. 4 Hours.
Offers an advanced studio-seminar to foster the creation and understanding of contemporary interdisciplinary art, emphasizing its role in reflecting and shaping its social contexts. Course activities include viewing, reading, and discussion of key projects, theories, methods, and professional practices as they have evolved over time, as well as regularly scheduled critique of the students’ ongoing bodies of work. Experiential learning opportunities allow students to interact with practitioners, curators, and institutions in the field. Offers students an opportunity to grow as practicing artists, designers, and arts professionals.

ARTD 5002. Art, Context, Action 2. 4 Hours.
Continues the study of interdisciplinary arts theory and practice begun in ARTD 5001.

ARTD 5101. Interactive Media Arts 1. 4 Hours.
Examines in-depth the issues involved in new media performance and interactive technologies that are used in or mediate performances, artworks, or installations. Emphasizes the ways in which current art intersects with ideas in the larger cultural context. Introduces methods of creative research and thematic development that results in a unique individual and/or stylistic expression. Offers students an opportunity to develop an individual approach to the interactive media art form that results in original works of art. Introduces concepts and practices of scripted interactive media including, but not limited to, Processing, Flash, JavaScript, and hardware such as Arduino.
ARTD 5202. Photographic Media in Cultural Context. 4 Hours.
Offers a practice-based course that gives students an opportunity to refine their photographic practice and to respond to contemporary photographic theory in conjunction with their portfolio work. Explores the many ways photography can be produced and experienced by investigating current cultural influences and technologies. Requires students to demonstrate an understanding of the various criteria used for making critical judgments about the visual arts, including the relationship of visual culture within a societal context. Using this individual approach to their photography, students are expected to develop a body of work that expresses their intent.

ARTD 5301. Independent Research Project 1. 4 Hours.
Offers students an opportunity to independently create practiced-based design of new media performance or experiences. Expects students to independently research interactive technologies used in contemporary-based artworks. Under faculty mentorship, students independently explore methods of creative research and thematic development that result in a unique individual and/or stylistic expression in original works of art. Includes student presentations of ongoing research and works in progress to faculty for assessment.

ARTD 5582. Collaborative Video and Community Engagement. 4 Hours.
Offers students an opportunity to explore the process of collaborative video making with a focus on the ethics and social dynamics of civic engagement in this video production course. Expects students to participate in interactive team-based production labs that mix theoretical analysis and technical training. Examines different theories that inform conceptualizations of social justice and ethics. Explores different forms of authorship, video genres, and digital tools for collaboration ranging from crowdsourcing to remix platforms. Offers students an opportunity to produce reflection papers on the process of collaboration and engagement with diversity, as well as video art projects for organizations working on campus and in the Boston area.

ARTD 6001. Art, Media, Participation 1. 4 Hours.
Offers a graduate studio-seminar to foster the creation and understanding of contemporary interdisciplinary art, emphasizing how varied media strategies foster audience interaction and public engagement. Course activities include readings and discussions of key projects, theories, and professional practices as they have evolved over time, as well as scheduled critique of the students’ ongoing bodies of work. Experiential learning opportunities allow students to interact with practitioners, curators, and institutions in the field. Paves the way toward the development of a graduate thesis project and offers students an opportunity to grow as practicing artists, designers, and arts professionals.

ARTD 6002. Art, Media, Participation 2. 4 Hours.
Continues the study of interdisciplinary arts theory and practice begun in ARTD 6001.

ARTD 6101. Interactive Media Arts 2. 4 Hours.
Continues ARTD 5101. Focuses on further research and creative development of a thematic approach to interactive media and installation as an art form. Offers students an opportunity to continue to develop an individual approach and expression in the media art that results in original artworks, installation, or digitally mediated experiences. The course goals are to advance interactive media practices resulting in unique exploration in the creation of innovative systems, installations, or experiences. Continues the study of methods for creative research and thematic development that results in a unique individual and/or stylistic expression.

ARTD 6201. Interactive Mobile Art Apps. 4 Hours.
Focuses on the creation of interactive art-based mobile apps and media. Drawn from a conceptual focus on interactive narrative and experiences, offers students an opportunity to explore mobile media as a vehicle for creative expression. Seeks to reinforce student knowledge of user-centric design processes and interaction strategies with the goal of understanding psychological and behavioral aspects of user experience as applied to conceptually oriented art and narrative projects. Surveys mobile apps in multiple environments, and introduces codebase libraries, resources, and methods for the creation of engaging interactive media content.

ARTD 6301. Independent Research Project 2. 4 Hours.
Continues ARTD 5301. Following through with creative and thematic development in practice-based research modality, offers students an opportunity to work independently to develop a creative project in an area related to public artworks that are interactive, audience- and viewer-responsive, or investigate how artworks define or alter public space. Under faculty mentorship, students work independently to develop and pursue a topic through to completion and presentation. The expectation is that realizable art, design, or media work; creative development; scholarly presentation; or other recognizable tangible result is achieved and presented to the faculty and to the public.

ART 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTS 2330. Sculpture Basics. 4 Hours.
Offers a studio course with an in-depth exploration into the process of creating sculpture. Builds on the introductory experience of ARTF 1124, with more advanced 3D concepts, materials, tools, and techniques. Emphasizes personal exploration, concept development, and creative innovation. Exposes students to sculpture through lectures, demonstrations, critiques, and hands-on assignments. Requires permission of instructor. May be repeated up to two times.

ARTS 2340. Painting Basics. 4 Hours.
Presents an introductory studio course in the fundamental techniques of painting. Formal problems in the study of color, light, space systems, form, and composition establish the foundation for more individual creative expression. Uses critiques and slide lectures as needed.

ARTS 2341. Figure Drawing. 4 Hours.
Focuses on developing the student’s awareness of the structure of the figure as well as the emotive qualities of “figuration.” Students draw from a model in each class. They also develop drawings based on the political and social concerns of contemporary culture and the role of gender as seen through “image.”.

ARTS 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTS 3449. Drawing in Mixed Media. 4 Hours.
Offers an upper-level course designed for students who want to explore the ever-changing discipline of drawing, which has now become a medium that stands on its own. Explores a range of media for generating drawings, including traditional techniques and computer-based media. Emphasizes open-ended application and interpretation of drawing as a medium. Requires students to attend lectures and exhibitions and keep a journal.
ARTS 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTS 4540. Art Degree Project 1. 4 Hours.
Draws on a range of theoretical and critical texts that address current issues and methodologies in art. Offers students an opportunity to complete writing assignments and to visit local artist studios, galleries, and museums. Writing and discussions are designed to lead to identification of a focus for ARTS 4541.

ARTS 4541. Art Degree Project 2. 4 Hours.
Introduces nontraditional art concepts in an intensive studio course. Includes categories of performance art, installation art, electronic art, multimedia, and kinetic art. Using their own frames of reference and experience, students contribute to a collaborative project and are responsible for keeping a journal that helps them formulate their ideas. Students reflect upon their co-op, internships, and other art-related experiences in a written essay that accompanies their final product.

ARTS 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ARTS 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ARTS 4997. Thesis. 4 Hours.
Focuses on the production of a twenty- to thirty-page thesis. Students do individual research under the direction of a faculty member on art-historical topics appropriate to their personal and professional interests. Conceived for art majors who are completing the Bachelor of Arts degree and whose primary interest is in art history. Fulfills the Arts and Sciences experiential education requirement for art/art history.

ARTS 5100. Visual Ideation. 4 Hours.
Explores drawing in a variety of media that communicate critical and analytical thinking about arts in the public sphere. Offers students an opportunity to learn how to use drawing and visualization to communicate effectively in a variety of media, either on paper or in digital media. Students can use collage, photo, digital media, and freehand drawing to express ideas for larger environmental and public projects. (Drawing is the way that artists such as Christo propose large-scale projects and is a viable way to secure acceptance of an idea.)

ARTS 6000. Studio. 4 Hours.
Offers students an opportunity to be mentored by a faculty member while completing the studio art portion of the master's degree. May be repeated up to four times.

ARTS 7896. Studio Continuation. 0 Hours.
Continues Art + Design studio work under the supervision of a departmental faculty member. Culminates for the successful student in approval of a thesis exhibition and/or written corollary for master’s-level work. May be repeated up to two times.

AACE 6000. Arts and Culture Organizational Leadership. 3 Hours.
Offers an overview and introduction to leadership knowledge areas, tools, and skills sets for the arts and culture sector. Key topics include issues and challenges in the management of arts-oriented organizations, leadership characteristics and techniques for arts and culture teams, balancing organizational priorities with artistic vision and values, board formation and management, audience outreach, and operational practices. Focuses on the administration of people and processes to communicate mission; realize goals; and effectively manage the creative resources, human resources, and financial challenges of nonprofit arts and cultural organizations.

AACE 6010. Planning for Arts and Cultural Organizations. 3 Hours.
Offers an overview and introduction to knowledge areas and primary skills sets for planning, launching, and sustaining arts and cultural organizations. Key topics include evaluating opportunities in the arts and culture sector; building effective vision, mission, and values for arts and culture initiatives in balance with civic and community contexts; smart approaches to arts and culture funding; developing sustainable and flexible strategic plans; and planning challenges for the contemporary strategic arts organization.

AACE 6020. Experiential Study in Arts Administration. 3 Hours.
Offers students an opportunity to learn best practices in arts project management, including how to assess and scope a project, develop a timeline with clear action items and goals, relay needs and expectations to clients, research materials to assist in the process, and measure and deliver project results. Faculty coach students to cultivate professional skill sets, build competency around key areas of student interest, and bridge theory with practice. Students receive feedback from their project sponsor, review lessons learned, and incorporate suggestions to improve and further develop their career plans. Seeks to support the development of business communication skills, project and client management skills, and frameworks for analysis.

AACE 6110. Information Technology for Arts and Cultural Organizations. 3 Hours.
Offers nontechnical students an opportunity to obtain a clear and current understanding of key information technology (IT) concepts set in the context of arts and cultural organizations and to empower them to make decisions that map technology to strategy. Covers how to identify technical terms, stakeholders, and issues; evaluate IT challenges; apply best-practice frameworks; and identify business needs and compare technical solutions in order to minimize cost and maximize strategic alignment. Combines readings, casework, video lectures, screen casts, guest videos, and a hands-on approach to researching solutions and leading change. Includes both group and individual deliverables that students synthesize to create and present a final project.

AACE 6200. Programming and Community Engagement for Cultural Entrepreneurs. 3 Hours.
Examines the role and tools of the cultural entrepreneur and investigates practical and tactical approaches centered around real-world examples. Topics include how cultural entrepreneurs turn new ideas into concrete initiatives and how they communicate with and learn from their audiences and communities to assess and evaluate the implementation of cultural endeavors. Offers students an opportunity to create their own cultural initiative from the ground up. Through modules covering mission and vision, program evaluation, community engagement, and basic resource management, the successful student should finish the course with a real project “in a box,” ready to launch.
Asian Studies (ASNS)

ASNS 1150. East Asian Studies. 4 Hours.
Seeks to provide an understanding of the constituent characteristics that originally linked East Asia as a region and the nature of the transformations that have occurred in the region over the last two thousand years. Concentrates on China and Japan, and addresses Korea and Vietnam where possible. Also seeks to provide students with effective interdisciplinary analytical skills as well as historical, ethical, cultural diversity, and aesthetic perspectives. ASNS 1150 and HIST 1150 are cross-listed.

ASNS 1151. Recitation for ASNS 1150. 0 Hours.
Provides small-group discussion format to cover material in ASNS 1150.

ASNS 1160. Introduction to South Asian Studies. 4 Hours.
Takes a multidisciplinary approach in exploring the formation of contemporary South Asia, with a focus on Bangladesh, India, Pakistan, and Sri Lanka. Examines the history of the region, from dawn of the colonial era to present times, seeking to understand the roots of the region’s social, cultural, and political development.

ASNS 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ASNS 2245. The Asian-American Experience. 4 Hours.
Examines the impact of Asian immigrant communities on U.S. political, economic, social, and cultural life and their encounters with racial, political, and economic discrimination from the nineteenth century to the present.

ASNS 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ASNS 3422. Topics in Chinese Studies. 4 Hours.
Covers special topics in Chinese studies. May be repeated without limit.

ASNS 3444. Topics in Japanese Studies. 4 Hours.
Covers special topics in Japanese studies. May be repeated without limit.

ASNS 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ASNS 4000. Asian Studies Capstone Directed Study. 4 Hours.
Offers independent intensive reading and writing on key interdisciplinary issues in Asian studies under the direction of faculty members in Asian studies on a topic chosen in consultation with the instructor.

ASNS 4910. Issues in Modern and Contemporary Asia. 4 Hours.
Offers intensive reading and writing on key interdisciplinary issues in Asian studies, such as oceanic trade, empire, postcolonialism, military relations, religion and politics, food security, human rights, economic and social justice, and environmental degradation.

ASNS 4920. Asian Studies Capstone Seminar. 4 Hours.
Offers advanced reading, research, and writing on a major topic of broad interdisciplinary significance in Asian studies, such as pan-Asianism; medicine and disease in Asia; Asian interactions with the West; orientalism, anticolonialism, and nationalism in modern Asia; gender transformations and women’s movements in Asia; modern thought in East and South Asia.

ASNS 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8-credit honors project. May be repeated without limit.

ASNS 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8-credit honors project. May be repeated without limit.

Behavioral Neuroscience (BNSC)

BNSC 1000. Behavioral Neuroscience at Northeastern. 1 Hour.
Introduces first-year and new transfer students to the major and the field of behavioral neuroscience and to the professional and academic resources available to students at Northeastern University. Acquaints students with their faculty, advisors, and fellow students; provides an initial orientation to undergraduate research, cooperative education, study abroad, and other experiential learning options; familiarizes students with academic support resources and leadership opportunities; provides grounding in the culture and values of the university community—in short, familiarizes students with all skills needed to become a successful university student.

BNSC 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BNSC 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BNSC 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BNSC 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8-credit honors project. May be repeated without limit.

BNSC 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

BNSC 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
BIOE 2350. Biomechanics. 4 Hours.
Introduces engineering and science students to core knowledge and understanding of physiological systems and processes. Focuses on quantitative analysis of human physiological systems. Topics include the physical and chemical foundations of physiology; coupled forces and flows; electrical, mechanical, and chemical potentials and their conjugated fluxes; and the physiology of excitable tissue. Examines cell structure, function, and homeostasis with a particular focus on membrane transport, osmotic pressure, cell signaling, and cellular energetics.

BIOE 2365. Bioengineering Measurement, Experimentation, and Statistics. 4 Hours.
Introduces the fundamentals of biomedical data acquisition and statistical analysis. Engineering statistics topics include descriptive statistics, probability distributions, hypothesis testing, analysis of variance, and experiment design. Applies these statistical topics by analyzing data obtained from laboratory exercises in BIOE 2366. Laboratory exercise topics include cell culture, mechanical testing, modeling medical imaging data, 3D printing, and bioprinting. Emphasizes using MATLAB software to analyze data on the computer.

BIOE 2366. Lab for BIOE 2365. 1 Hour.
Offers associated laboratory exercises for BIOE 2365. Requires lab reports from all students.

BIOE 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOE 3000. Professional Issues in Engineering. 1 Hour.
Offers an opportunity to reflect on both academic and co-op experiences in the context of planning for the senior year and beyond. Topics include professional and ethical issues; resolving ethical conflicts; awareness of engineers as professionals in a diverse world; strengthening decision-making skills; career portfolios; and lifelong learning needs, goals, and strategies. Students reflect upon issues of diversity from their experience in the university and in their cooperative education placements. Explores the role of different work and learning styles and diverse personal characteristics in the workplace and the classroom. Professional issues include impact of the cultural context, both in the United States and around the world, on the client, government relations, and workplace.

BIOE 3210. Bioelectricity. 4 Hours.
Discusses principles of circuits, signals, and systems in the context of operating principles of bioelectrical systems at multiple physiological scales. Offers students an opportunity to obtain the fundamental background required to interface biological systems with circuits and sensors for measurements. Covers fundamentals of structure and function of electrically active tissue including nerves, brain, and muscle, including heart.

BIOE 3310. Transport and Fluids for Bioengineers. 4 Hours.
Covers the fundamental principles of processes and systems in which mass, energy, and momentum are transported in typical biological problems. Emphasizes momentum transport for incompressible and compressible fluids (fluid flow) and energy transport. The methods taught are relevant to the analysis of physiological systems, processing, and separation of biological materials.
BIOE 3380. Biomolecular Dynamics and Control. 4 Hours.
Focuses on the principles of thermodynamics and kinetics applied to the analysis and design of biomolecular systems. Covers foundational topics—such as mass and energy balances, chemical equilibria, and enzyme kinetics—in a biological context. Introduces the role of feedback and feed-forward control in biomolecular networks, emphasizing basic analytical and computational methods, including the use of MATLAB, for analyzing how these regulatory structures affect the dynamics of small-scale, prototypical networks.

BIOE 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOE 4790. Capstone Design 1. 4 Hours.
Offers students an opportunity to apply design principles to create a device or process to solve a relevant bioengineering problem. Teams develop, construct, and evaluate prototypes under real-world fiscal, regulatory, and safety conditions. Progress is monitored through a series of oral presentations in design gate review meetings. Requires a thorough written report and working prototype for course completion.

BIOE 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8-credit honors project. May be repeated without limit.

BIOE 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

BIOE 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOE 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

BIOE 4992. Directed Study. 1-4 Hours.
Offers theoretical or experimental work under the direction of members of the department under a chosen topic. Course content depends on instructor. May be repeated without limit.

BIOE 5060. Special Topics in Bioengineering. 4 Hours.
Focuses on topics of timely interest to students of science and engineering. Topic varies from semester to semester. When appropriate, the course takes advantage of unique opportunities afforded by visiting faculty and guests. May be repeated once.

BIOE 5100. Medical Physiology. 4 Hours.
Designed to provide bioengineering students with a working knowledge of the integrated behavior of organs and systems in the human body. As such, the student is provided with a comprehensive and intense immersion in each physiological subsystem with the expectation that he or she display knowledge of each at the level equivalent to that of a second-year medical student following his or her exposure to physiology. The specific subsystems covered are muscle physiology, cardiovascular physiology with ECG interpretation, pulmonary physiology with gas exchange mechanics and ventilation/perfusion, renal physiology and water balance, regulation of pH, gastrointestinal physiology, temperature regulation and energy balance, endocrine systems, and reproductive systems. The course does not cover neurophysiology. Requires prior completion of BIOL 1117 or equivalent.

BIOE 5235. Biomedical Imaging. 4 Hours.
Presents the foundations of modern medical imaging, including imaging principles, imaging mathematics, imaging physics, and image-generation techniques. Includes X-ray, ultrasound, computed tomography, and magnetic resonance imaging.

BIOE 5250. Design, Manufacture, and Evaluation of Medical Devices. 4 Hours.
Covers engineering design challenges intrinsic to the development of biomedical devices, including clinical evaluation, manufacture, and testing of medical devices and the constraints that FDA regulations place on these processes. Topics include quality systems, design control, cybersecurity concerns, the role of standards in global device regulation, and the design process. Students are asked to form teams and to carry out a semester-long conceptual design project to develop a design overview, design plan, design input specifications, and verification test procedures for a novel medical device.

BIOE 5320. Advanced Biomedical Measurements and Instrumentation. 4 Hours.
Offers a comprehensive analysis of the principles underlying biomedical instrumentation, including ECG, EEG, CAT scanning, MRI imaging, and other biomedical laboratory tools. Includes associated laboratory exercises within the course material.

BIOE 5380. Advanced Biomolecular Dynamics and Control. 4 Hours.
Applies the foundational principles of thermodynamics and kinetics to the analysis and design of biomolecular systems. Briefly reviews mass and energy balances, chemical equilibria, and enzyme kinetics. Emphasizes more advanced topics, such as the effect of external fields (e.g., mechanical forces, electrical potential) on biomolecular reaction equilibria and kinetics, the spatiotemporal dynamics of reactions in the context of mass transport, and the effect of spatial compartmentation on biomolecular propagation of information. Examines the role of feedback and feedforward control in biomolecular networks, focusing on analyzing how these regulatory structures affect adaptation and oscillatory behavior of small- and large-scale networks. Intended for students in the College of Engineering and in the College of Science. Students from other disciplines are invited to enroll—requires prior knowledge of differential and integral calculus, systems of ordinary differential equations and linear algebra, coding in Matlab, and familiarity with chemical kinetics and thermodynamics.

BIOE 5410. Molecular Bioengineering. 4 Hours.
Introduces the fundamentals of molecular structure and function that underpin engineering of biological macromolecules. Builds on this base with the application of design concepts for molecules and methods of structural and functional analyses and strategies for design and redesign of therapeutic molecules. Projects seek to provide students with experience in conceptual design to create strategies to address significant health concerns.

BIOE 5420. Cellular Engineering. 4 Hours.
Analyses the techniques that form the foundation of molecular cell engineering, including recombinant DNA, cloning and genomics, prokaryotic and eukaryotic gene regulation and single-cell gene expression, structure, dynamics of gene regulatory networks, metabolism and cellular energetics, cell structure, cytoskeleton and cellular motors, synthetic gene circuits, and metabolic engineering.
BIOE 5430. Principles and Applications of Tissue Engineering. 4 Hours.
Applies the principles of biology and biomedical engineering to the creation of artificial organs for transplantation, basic research, or drug development. Requires integration of knowledge of organic chemistry, cell biology, genetics, mechanics, biomaterials, nanotechnology, and transport processes to create functional organs. Reviews basic cell culture techniques, structure function relationships, cellular communication, natural and artificial biomaterials, and the basic equations governing cell survival and tissue organization.

BIOE 5630. Physiological Fluid Mechanics. 4 Hours.
Analyzes biofluids and their mechanics, including cardiovascular fluid mechanics. Examples are taken from biotechnology processes and physiologic applications, including the cardiovascular, respiratory, ocular, renal, musculoskeletal, and gastrointestinal systems. Topics include dimensional analysis, particle kinematics in Eulerian and Lagrangian reference frames, constitutive equations and Newtonian/non-Newtonian biofluid models, flow and wave propagation in flexible tubes, and oscillatory and pulsatile flows.

BIOE 5650. Multiscale Biomechanics. 4 Hours.
Seeks to help students develop and apply scaling laws and continuum mechanics to biomechanical phenomena at different length scales starting from a single molecule, moving up to the cellular and tissue levels. Topics include structure of tissues and the molecular basis for macroscopic properties; chemical and electrical effects on mechanical behavior; cell mechanics, motility, and adhesion; biomembranes; biomolecular mechanics and molecular motors; and experimental methods for probing structures at the tissue, cellular, and molecular levels.

BIOE 5810. Design of Biomedical Instrumentation. 4 Hours.
Investigates the principles of biology and engineering underlying the design and use of biomedical instrumentation. Topics include design of a broad range of instrumentation and monitoring devices, sensors, and integrated systems.

BIOE 5820. Biomaterials. 4 Hours.
Offers a broad overview of the field of biomaterials (materials used in medical devices that interact with living tissues). Introductory lectures cover biomaterials and their translation from the laboratory to the medical marketplace. Discusses important biomaterials terminology and concepts. Emphasizes material structure-property-function-testing relationships and discusses specific materials used in medical devices and drug delivery. Concludes with introductions to topics in the field, such as biomaterials-tissue interactions, tissue engineering, and regulatory requirements. Considers principles of device design as related to the selection and application of biomaterials.

BIOE 5850. Design of Implants. 4 Hours.
Studies the use of cell-matrix control volumes; stress analysis in design processes; anatomical fit, shape, and size of implants; biomaterials; surgical implantation procedures; testing for safety and efficacy; and design of clinical trials. Covers applications to orthopedic devices, soft tissue implants, artificial organs, and dental implants.

BIOE 6000. Principles of Bioengineering. 1 Hour.
Covers the fundamentals of bioengineering research topics and methodology for master's-level bioengineering students. Internal and external speakers discuss general topics in bioengineering, including the medical device qualification and regulatory environment, tissue engineering, cell engineering, mechanobiology, drug delivery, bioimaging, neuromotor control, and effective design of experiments. Each student is expected to read, critically evaluate, and present research in a peer-reviewed bioengineering journal article.

BIOE 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOE 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

BIOE 6965. Co-op Work Experience Abroad. 0 Hours.
Provides eligible students with an opportunity for work experience abroad. May be repeated without limit.

BIOE 7000. Principles of Bioengineering. 4 Hours.
Designed to introduce new graduate bioengineering students to the fundamentals of bioengineering research topics and methodology. Includes outside speakers to discuss general topics in bioengineering. Examples of course topics include the medical device qualification and regulatory environment, tissue engineering, cell engineering, mechanobiology, drug delivery, bioimaging, neuromotor control, effective design of experiments, writing research proposals for the National Institutes of Health (NIH) and how to evaluate and write a peer-reviewed journal article, etc. Expect students to read, critically evaluate, and present the research in a bioengineering journal article. Students are then expected to extend their article into a hypothesis-driven proposal in NIH format with an oral defense of the proposal.

BIOE 7001. Biomaterials. 4 Hours.
Introduces biomaterials science. Reviews the design of medical implants, artificial organs, and engineered matrices. The development of modern day biomaterials is tracked by introducing the student to first-, second-, and third-generation biomaterials. Students are guided from the earliest ad-hoc materials to advanced tissue-engineered constructs. Examines the challenges of implantation of materials, including developing an understanding of the material design requirements and an understanding of the host response. Covers regulatory standards for the design of materials for use in vivo. Studies the molecular and cellular interactions with biomaterials designed to act as scaffolding for later implantation into host systems.

BIOE 7100. Special Topics in Biomedical Imaging and Signal Processing. 4 Hours.
Offers various topics of interest in biomedical imaging and signal processing for advanced study depending on the interests of the faculty and students. May be repeated up to two times.

BIOE 7200. Special Topics in Cell and Tissue Engineering. 4 Hours.
Offers various topics of interest in cell and tissue engineering for advanced study depending upon the interests of the faculty and students. May be repeated up to two times.

BIOE 7300. Special Topics in Biomechanics. 4 Hours.
Offers various topics of interest in biomechanics for advanced study depending upon the interests of the faculty and students. May be repeated up to two times.

BIOE 7374. Special Topics in Bioengineering. 4 Hours.
Offers topics of interest to the staff member conducting the course for advanced study. Undergraduate students may take this class with permission of instructor. May be repeated without limit.

BIOE 7390. Seminar. 0 Hours.
Presents topics of an advanced nature by staff, outside speakers, and students in the graduate program. This course must be attended every semester by all full-time graduate students. May be repeated without limit.
BIOE 7400. Special Topics in Biomedical Devices. 4 Hours.
Offers various topics of interest in biomedical devices for advanced study depending upon the interests of the faculty and students. May be repeated up to two times.

BIOE 7890. Master's Project. 4 Hours.
Offers analytical and/or experimental work leading to a written report and a final short presentation by the end of the semester.

BIOE 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOE 7978. Independent Study. 1-4 Hours.
Offers theoretical or experimental work under individual faculty supervision. May be repeated for up to 16 total credits.

BIOE 7990. Thesis. 4 Hours.
Offers analytical, research, and/or experimental work conducted under the auspices of the department. May be repeated once.

BIOE 7996. Thesis Continuation. 0 Hours.
Continues thesis work conducted under the supervision of a departmental faculty.

BIOE 8960. Exam Preparation—Doctoral. 0 Hours.
Offers a student an opportunity to prepare for the PhD qualifying exam under faculty supervision. Intended for students who have completed all required PhD course work and have not yet achieved PhD candidacy; students who have not completed all required PhD course work are not allowed to register for this course. May be repeated once.

BIOE 8986. Research. 0 Hours.
Offers a student an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

BIOE 9000. PhD Candidacy Achieved. 0 Hours.
Indicates successful completion of program requirements for PhD candidacy.

BIOE 9984. Doctoral Research. 1-8 Hours.
Investigates doctoral research topics under supervision of an individual faculty member. May be repeated up to 15 times for up to 16 total credits.

BIOE 9986. Research. 0 Hours.
Offers a student an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

BIOE 9990. Dissertation. 0 Hours.
Offers theoretical and/or experimental work conducted under the auspices of the department. Must be taken in two consecutive semesters. May be repeated once.

BIOE 9996. Dissertation Continuation. 0 Hours.
Offers continued dissertation work conducted under the supervision of a departmental faculty member. May be repeated without limit.

---

Biology (BIOL)

BIOL 1000. Biology at Northeastern. 1 Hour.
Introduces first-year students to the major and the field of biology and to the professional and academic resources available to students at Northeastern University; acquaints students with their faculty, advisors, and fellow students; provides an initial orientation to undergraduate research, cooperative education, and other experiential learning options; helps develop the academic skills necessary to succeed; provides grounding in the culture and values of the university community; and assists in interpersonal skill development—in short, familiarizes students with the resources and skills needed to become a successful university student.

BIOL 1107. Foundations of Biology. 4 Hours.
Introduces evolutionary principles, cellular structure and function, genetic transmission, energy pathways, and physiology. Covers current topics in biology and evaluates and discusses current scientific literature. Explores the interdisciplinary nature of biology. Offers students an opportunity to prepare for the topical inquiries in biology courses.

BIOL 1108. Lab for BIOL 1107. 1 Hour.
Accompanies BIOL1107. Includes various lab experiments that emphasize evolutionary principles, cellular structure and function, genetic transmission, energy pathways, and physiology.
BIOL 1111. General Biology 1. 4 Hours.
Explores basic principles of biology with a focus on those features shared by all living organisms and seen through the lens of evolutionary theory. Through lectures, readings, and discussion, the course offers an opportunity to understand how the scientific method has been and is used to address biological questions. Central topics include recent advances in cell anatomy and physiology, including the interplay between organelles, membrane transport, and cell-signaling; energy transfer through cells and through the biosphere; cellular reproduction and cancer; heredity and human genetic disorders; and protein synthesis and biotechnology. Explores the societal implications of such topics as biopharmaceuticals, ocean acidification, climate change, human diseases, epigenetics, cancer, and cloning.

BIOL 1112. Lab for BIOL 1111. 1 Hour.
Accompanies BIOL 1111. Offers students an opportunity to collect quantitative data through hands-on experimentation as well as simulations. Data is analyzed statistically and presented in written form.

BIOL 1113. General Biology 2. 4 Hours.
Continues BIOL 1111. Examines the evolution of structural and functional diversity of organisms; the integrative biology of multicellular organisms; and ecological relationships at the population, community, and ecosystem levels.

BIOL 1114. Lab for BIOL 1113. 1 Hour.
Accompanies BIOL 1113. Covers topics from the course through various experiments.

BIOL 1115. General Biology 1 for Engineers. 4 Hours.
Introduces basic molecular and cellular biology principles and concepts. Offers students an opportunity to begin to apply chemical and engineering principles to further an understanding of selected physiological processes and biological systems. Topics include protein structure and function, cellular organization, energetics, information management, molecular transport, signaling, and motility.

BIOL 1116. Lab for BIOL 1115. 1 Hour.
Accompanies BIOL 1115. Covers topics from the course through various experiments.

BIOL 1117. Integrated Anatomy and Physiology 1. 4 Hours.
Introduces students to integrated human anatomy and physiology. Focuses on structure and function of cells and tissues. Presents the anatomy and physiology of skin, bones, muscles, blood, and the nervous system.

BIOL 1118. Lab for BIOL 1117. 1 Hour.
Accompanies BIOL 1117. Covers topics from the course through various experiments.

BIOL 1119. Integrated Anatomy and Physiology 2. 4 Hours.
Continues BIOL 1117. Presents the structure and function of the human endocrine, reproductive, cardiovascular, respiratory, urinary, and digestive systems as well as the regulation of metabolism and body temperature.

BIOL 1120. Lab for BIOL 1119. 1 Hour.
Accompanies BIOL 1119. Covers topics from the course through various experiments.

BIOL 1121. Basic Microbiology. 4 Hours.
Focuses on how to identify, control, and live with bacteria and viruses. Emphasizes the mechanisms of disease production, natural host defense systems, and medical interventions.

BIOL 1122. Lab for BIOL 1121. 1 Hour.
Accompanies BIOL 1121. Covers topics from the course through various experiments.

BIOL 1141. Microbes and Society. 4 Hours.
Introduces the unseen world of microorganisms. Students analyze how the growth and behavior of this diverse group of organisms affect many aspects of human society including agriculture and food preparation; drug development and manufacture; liquid and solid waste management; genetic engineering; geochemical cycles; and health and disease.

BIOL 1143. Biology and Society. 4 Hours.
Offers an overview of how biology weaves its way across a broad spectrum of complex societal issues. Introduces students to the biological mechanisms and processes responsible for genetic inheritance, energy transfer, evolution, and population dynamics, providing a framework within which students may critically interpret and discuss important biological information provided in public forums. Seeks to empower students to make informed choices at the policy and personal levels. Offers students an opportunity to acquire an understanding of the basic principles of biology and apply the scientific process to the analysis of contemporary issues. Using a thematic approach, covers a wide range of issues including the reemergence of plagues, biological weapons and security, the environment, and human health and wellness.

BIOL 1147. The Human Organism. 4 Hours.
Introduces the structure and function of the human body. Emphasizes the principles of biological and physical science as they relate to life processes in health and disease.

BIOL 1149. Biology of Human Reproduction. 4 Hours.
Studies sexual and reproductive function in the human male and female, that is, sexual development, coitus, fertilization, pregnancy, birth, and lactation. Discusses the methods of controlling fertility and sexually transmitted diseases. Analyzes factors affecting reproduction and sexuality in human population.

BIOL 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOL 2299. Inquiries in Biological Sciences. 4 Hours.
Focuses on the latest developments in the field. Offers students an opportunity to explore both scientific practice and progress through readings, discussion, and projects to expand and deepen their understanding of fundamental biological principles at the cellular and molecular level.

BIOL 2300. Lab for BIOL 2299. 1 Hour.
Accompanies BIOL 2299. Offers various lab experiments that emphasize student inquiry.

BIOL 2301. Genetics and Molecular Biology. 4 Hours.
Focuses on mechanisms of inheritance, gene-genome structure and function, and developmental genetics and evolution. Examples are drawn from the broad spectrum of plants, animals, fungi, bacteria, and viruses. Topics and analytical approaches include transmission genetics, molecular biology and gene regulation, DNA molecular methods, quantitative and population genetics, bioinformatics, genomics, and proteomics.

BIOL 2302. Lab for BIOL 2301. 1 Hour.
Accompanies BIOL 2301. Reinforces and extends concepts presented and practiced in the accompanying lecture course through the application of scientific investigation methods and data analysis.

BIOL 2309. Biology Project Lab. 4 Hours.
Offers an inquiry-based, intensive laboratory experience in which students have an opportunity to design and conduct independent research projects, applying approaches and techniques used in cell and molecular biology. Offers students an opportunity to present their results in professional formats.
BIOL 2321. Microbiology. 4 Hours.
Introduces morphological, ecological, and biochemical consideration of representative groups of bacteria. Introduces virology and microbial genetics; host-parasite relationships, prokaryotes of medical significance; and physical and chemical controls of microbial growth.

BIOL 2322. Lab for BIOL 2321. 1 Hour.
Accompanies BIOL 2321. Covers topics from the course through various experiments.

BIOL 2327. Human Parasitology. 4 Hours.
Examines the general biology, life cycles, modes of transmission, and pathogenesis of major parasites on global human health. Explores a number of important diseases, along with the diverse protozoans, worms, and arthropods responsible for them.

BIOL 2329. Bioethics. 4 Hours.
Offers students an opportunity to explore ethical issues arising from biological research and emerging technologies, to learn to identify and critically analyze potential ethical implications of biological research, and to evaluate theory-based arguments while respectfully engaging with a diversity of perspectives. Using their knowledge of basic cellular and molecular science as a foundation, students have an opportunity to gain a deeper understanding of the biology of genome editing and other molecular and cellular biology-based technologies. Examines the history and ethical dialogue around genome editing as an in-depth example of an emerging technology with wide-ranging applications. Studies additional technologies with respect to research progress, international perspectives, and potential implications in the areas of security, environmental protection, and personal health.

BIOL 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOL 3401. Comparative Vertebrate Anatomy. 4 Hours.
Examines the morphology and phylogeny of the vertebrates.

BIOL 3403. Animal Behavior. 4 Hours.
Examines the evolution of animal behavior. Topics include how behaviors have evolved, the adaptive function of behavior, and the relative roles of genes and the environment in the development of behavior. Behaviors from feeding and reproductive strategies to communication and social behavior are considered. Implications for human behavior are considered.

BIOL 3405. Neurobiology. 4 Hours.
Introduces the cellular and molecular functioning of the nervous system, the organization of neurons into circuits, the processing of information, and the generation of motor output.

BIOL 3409. Current Topics in Biology. 4 Hours.
Examines selected topics in biology. Topics vary each semester. May be repeated without limit.

BIOL 3601. Neural Systems and Behavior. 4 Hours.
Reviews major experimental approaches and key concepts used in behavioral neurobiology. Begins with a look at its history. Topics covered include spatial orientation and sensory guidance, neuronal control of motor output, neuronal processing of sensory information, sensorimotor integration, neuromodulation, circadian rhythms and biological clocks, behavioral physiology of large-scale navigation, neurobiology of communication, and cellular mechanisms of learning and memory.

BIOL 3603. Mammalian Systems Physiology. 4 Hours.
Designed to familiarize students with fundamental principles in mammalian physiology. Emphasizes major organ systems integration. Where applicable, explores and uses human physiology to reinforce principles in physiology and build upon these principles by analyzing how major organ systems effectively network for proper organismal function. Initially covers the physiological principles of energy and metabolism in mammals, including human adaptation for basic energy requirements, and then delves into basics of membrane transport. Evaluates roles for organ systems integration in the respiratory, cardiovascular, gastrointestinal, hemopoietic, renal, and reproductive systems.

BIOL 3605. Developmental Neurobiology. 4 Hours.
Covers the cellular, molecular, and genetic processes that guide neural development. Focuses on how nerve cells are generated, patterned, and connected with one another to regulate animal behavior. Topics include cell differentiation, tissue patterning, neural plasticity, and cognitive development.

BIOL 3607. Current Trends in Reproductive Sciences. 4 Hours.
Introduces current trends in the field of reproductive sciences, spanning basic human reproduction, infertility, and potential horizons in medicine. Surveys topics in basic research that have the most promise to make an impact in the field of women’s health. Emphasizes human health but includes animal models in the analysis.

BIOL 3609. Developmental Biology. 4 Hours.
Focuses on organismal development at cellular, molecular, and anatomical levels. Topics include gametogenesis, fertilization, cleavage, gastrulation, organogenesis, and metamorphosis. Invertebrates and vertebrates provide descriptive and experimental models. Laboratory work emphasizes echinoderms, amphibians, birds, and mammals.

BIOL 3611. Biochemistry. 4 Hours.
Covers structure and function of biomolecules, central concepts of bioenergetics and thermodynamics, enzyme kinetics and regulation, and metabolic pathways.

BIOL 3612. Lab for BIOL 3611. 1 Hour.
Accompanies BIOL 3611. Covers topics from the course through various experiments.

BIOL 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOL 4701. Biology Capstone. 4 Hours.
Integrates and assesses the concepts and skills obtained from the entire biology curriculum, including experiential and classroom-based components. Requires reflection by students on their various educational experiences, extensive research of scientific questions related to these experiences, and development of an original research proposal. Offers students an opportunity to hone communication skills through formal and informal presentations, class discussion, and critique.

BIOL 4705. Neurobiology of Cognitive Decline. 4 Hours.
Introduces the neuroanatomical and cognitive sequelae of brain aging and neurodegenerative disease. Covers molecular and cellular processes that damage neurons, animal models, and brain imaging. Explores higher-level manifestations of damage to, for example, memory, language, and reward systems.
Biology (BIOL)

BIOL 4707. Cell and Molecular Biology. 4 Hours.
Integrates molecular biology and biochemistry in the cellular context. Focuses on the organization and function of eukaryotic cells, including the regulation of nuclear structure and gene expression, signal transduction, protein synthesis and growth, cellular energetics, the cytoskeleton and cell motility, cell division, and cell death. Emphasizes the scientific methodologies and approaches that underlie discovery in cell biology.

BIOL 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

BIOL 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field.

BIOL 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOL 4991. Research. 4 Hours.
Offers independent laboratory research work on a chosen topic under the direction of members of the department. Course content depends on instructor. May be repeated without limit.

BIOL 4994. Internship. 4 Hours.
Offers students an opportunity for internship work. May be repeated without limit.

BIOL 5100. Biology Colloquium. 1 Hour.
Offers a series of colloquia in biological research by invited experts on current topics. May be repeated without limit.

BIOL 5306. Biological Clocks. 4 Hours.
Examines the expression of endogenously generated twenty-four-hour (circadian) rhythms in eukaryotic life, emphasizing theoretical foundations as well as current research strategies for understanding how biological clocks work. Presents analytic principles essential for understanding biological rhythmicity in any organism at any level of organization. Emphasizes strategies used to understand the concrete mechanisms underlying biological rhythmicity.

BIOL 5307. Biological Electron Microscopy. 4 Hours.
Presents techniques of electron microscopy applied to biological materials. Discusses specimen preparation, fixation, thin-sectioning, staining, operation of the microscopes, photographic techniques, and interpretation of electron micrographs. Requires student seminars and project.

BIOL 5308. Lab for BIOL 5307. 1 Hour.
Designed for graduate and advanced undergraduate students with no formal training in electron microscopy. Offers students an opportunity to acquire a thorough working knowledge of transmission and scanning electron microscopy by having each student process specimens from living tissue through the production of electron micrographs. This involves standard specimen preparation protocols including fixation, embedding, ultramicrotomy, staining, critical point drying, and sputter coating, as well as the independent operation of state-of-the-art electron microscopy equipment.

BIOL 5499. Plant Biotechnology. 4 Hours.
Designed as an introductory course on plant biotechnology for upper-level undergraduates and first-year graduate students. Using examples from current research, offers students an opportunity to review the technology used to modify and improve economically important plants for sustainable agriculture as well as for the production of pharmaceutical and medicinal products. Specific topics include principles of plant heredity and genetics (molecular biology), plant breeding and improvement, hormones and growth regulators, gene isolation, plant tissue culture and transformation, plant-based pharmaceutical production, and stress tolerance and improvement. The course consists of weekly lectures, laboratory demonstrations, and review sessions of recent literature.

BIOL 5533. Vertebrate Microanatomy. 4 Hours.
Deals with the structure and function of cells, tissues, and organs in vertebrate animals at light and electron microscopic levels.

BIOL 5534. Lab for BIOL 5533. 1 Hour.
Accompanies BIOL 5533. Seeks to enable the student to identify microscopically the structures of cells, tissues, and organs in vertebrate animals at light and electron microscopic levels.

BIOL 5541. Endocrinology. 4 Hours.
Explores the endocrine regulation of physiological systems, emphasizing current research. Lectures provide background, followed by analysis of primary literature and case studies. Topics include growth, reproduction, nutrient utilization, stress, and environmental endocrine disruption. Emphasizes humans but includes material on other animals, including invertebrates.

BIOL 5543. Stem Cells and Regeneration. 4 Hours.
Explores the biological basis of embryonic, adult, and induced pluripotent stem cells toward an understanding of their roles in development, homeostasis, and regeneration, as well as their therapeutic potential. The study of stem cells is a rapidly advancing area in biology and biomedicine. Although the biological basis of stem cells is a major focus, the course aims to put this knowledge into a biomedical context.

BIOL 5549. Microbial Biotechnology. 4 Hours.
Offers readings and seminar-style discussion from the current literature on important inventions and practical applications in biotechnology, with a focus on drug discovery.

BIOL 5553. Biology of Muscle: Molecules to Movements. 4 Hours.
Examines the biology of skeletal muscle and movement in an integrated fashion. Considers the biochemical, physiological, and structural properties of skeletal muscle that adapt it to diverse mechanical functions. Examines the structure and function of the contractile proteins and their assembly into sarcomeres. Considers the regulation of these elements through excitation-contraction coupling. Reviews the metabolic machinery that supplies the energy for contraction, with emphasis on the regulatory systems that link energy supply and demand and the overall efficiency of contraction. Presents the architectural organization of muscle fibers and connective tissue elements to form mechanical linkages to the skeleton. This information is integrated by analyzing the function and performance of skeletal muscle during movement. Considers locomotor systems including swimming, flying, running, and jumping.

BIOL 5569. Advanced Microbiology. 4 Hours.
Focuses on how microorganisms develop, exchange, and regulate genes, and survive in various environments. Emphasizes experimental design and proof, particularly as related to genetic exchange, gene regulation, single and multicellular development, and cell-cell communication.
BIOL 5571. Microbial Ecology. 4 Hours.
Focuses on the fundamental role of microbial communities in the function of the biosphere. Surveys the diversity of microorganisms, their ecological strategies, and interactions in aquatic and soil communities, deep sea vent and subsurface rock environments, extreme conditions of Antarctic ice, and boiling springs.

BIOL 5572. Lab for BIOL 5571. 1 Hour.
Accompanies BIOL 5571. Covers topics from the course through various experiments.

BIOL 5573. Medical Microbiology. 4 Hours.
Emphasizes host-parasite interactions: virulence, toxins, natural flora, and immunological responses; characteristics of the common bacterial, rickettsial, and protozoal infections in humans; and epidemiology, pathology, vaccines, and chemotherapy.

BIOL 5581. Biological Imaging. 4 Hours.
Illustrates imaging principles and techniques and their application to biological problems. Topics vary and may include microscopic and macroscopic approaches in areas such as cellular and neurobiology, ecology, and biochemistry.

BIOL 5583. Immunology. 4 Hours.
Provides an overview of the structure and function of genes, proteins, and cells involved in the generation of the immune response. Emphasis is on molecular immunology and immunogenetics.

BIOL 5585. Evolution. 4 Hours.
Discusses history of evolutionary theory and lines of evidence. Emphasis is on mechanisms of speciation. Introduces and discusses current evolutionary topics.

BIOL 5587. Comparative Neurobiology. 4 Hours.
Presents a cellular approach to structure and function of the nervous system. Topics include neuronal anatomy, phylogeny of nervous systems, electrophysiology of membrane conductances, synaptic transmission, integration in nerve cells, neuronal networks, sensory systems, motor systems, sensory-motor integration, development and regeneration of neuronal connectivity, and fundamentals of neurotechnology for biomedics. Focuses on the development of these concepts from the primary research literature. A term project involves the design of a simple nervous system for a hypothetical animal.

BIOL 5591. Advanced Genomics. 4 Hours.
Intended for those familiar with the basics of genetics, molecular and cellular biology, and biochemistry, all of which are required to appreciate the beauty, power, and importance of modern genomic approaches. Introduces the latest sequencing methods, array technology, genomic databases, whole genome analysis, functional genomics, and more.

BIOL 5593. Cell and Molecular Biology of Aging. 4 Hours.
Covers the recent scientific discoveries that have transformed our understanding of the process of aging. Examines in-depth the current understanding of the molecular mechanisms that control life span in model organisms, including yeast, worms, flies, and mice. Discusses dietary interventions and pharmacological approaches that extend the life span and delay the onset of age-related diseases. Covers potential applications of the new science of aging to improve human health. Requires students to read, discuss, present, and report on primary research papers from the literature. Prereq. (a) BIOL 2323 and junior or senior standing or (b) graduate standing.

BIOL 5597. Immunotherapies of Cancer and Infectious Disease. 4 Hours.
Describes the basic principles and the current promises and disappointments with immunotherapies of cancer. Provides a historical overview of the main barriers between tumors and antitumor killer cells. The unifying focus of the lectures is the role of immunological and physiological negative regulators, i.e., “brakes” of anti-tumor immune response. A significant part of the course is dedicated to the retrospective evaluation of the last three decades of the immunological and biochemical studies that culminated in identification of the “chief of tumor defense operations,” i.e., a hypoxia-adenosinergic pathway in the tumor microenvironment.

BIOL 5601. Multidisciplinary Approaches in Motor Control. 4 Hours.
Studies the field of human motor control, or motor neuroscience. Offers students an opportunity to obtain a fundamental understanding of the processes underlying the acquisition and control of sensorimotor behavior. The systems approach connects a variety of disciplines ranging from neurophysiology, to engineering, to neurorehabilitation. Reviews a selection of approaches with emphasis on motor learning. Focuses on early behavioral approaches, more recent neurophysiological and imaging approaches, and rehabilitation. Discusses selected representative papers, including seminal historical papers and more recent studies reflecting the current discussion in the field.

BIOL 6299. Molecular Cell Biology for Biotechnology. 3 Hours.
Integrates biochemistry and molecular biology in the cellular context. Includes the organization and replication of genomes, principles and methods for genetic manipulation, the regulation of gene expression, and the structure and function of organelles. Emphasizes protein synthesis, including translation, post-translational modifications, and translocations of proteins within the cells and secretion.

BIOL 6300. Biochemistry. 4 Hours.
Studies the structure and function of biomolecules, with an emphasis on proteins; enzyme catalysis; and cellular metabolism, with an emphasis on bioenergetics and carbohydrate/lipid.

BIOL 6301. Molecular Cell Biology. 4 Hours.
Integrates biochemistry and molecular biology in the cellular context. Emphasizes the organization and replication of genomes, the regulation of gene expression, the structure and function of organelles, and the mechanisms of signal transduction.

BIOL 6303. Neurobiology and Behavior. 4 Hours.
Offers a lecture course that aims to provide a comprehensive overview of behavioral neurobiology, with special emphasis on a neuroethological approach. At the end of the course, the successful student should have a contemporary understanding of the historical development of the behavioral sciences, the major ethological and neurobiological concepts, and the principal mechanisms that govern behavior in animals and humans. Requires permission of instructor for those students not enrolled in bioinformatics, biology, or marine biology.

BIOL 6381. Ethics in Biological Research. 2 Hours.
Discusses ethical issues relevant to research in the biological sciences. Requires student presentations.
BIOL 6399. Dynamics of Microbial Ecology. 4 Hours.
Explores state-of-the-art research on microbial biology of the environment and human body. Focuses on molecular diversity of microbial species and microbial discovery, microbial dynamics across time and space, microbiology of extreme environments, microbial ecology in the genomics age, host-microbe interactions in the human body, and translation of basic microbiology into practice. Emphasizes new concepts in microbial biology, such as signal-based regulation and cell individuality, may change the current views of organization and function of microbial communities in nature. Requires permission of instructor for those students not enrolled in bioinformatics, biology, or marine biology.

BIOL 6401. Research Methods and Critical Analysis in Molecular Cell Biology. 4 Hours.
Encompasses biochemical and cell biological approaches to understanding cell structure and function, including membranes, organelles, vesicle trafficking, cytoskeleton, cell cycle, and signaling. Structured activities integrate critical analysis of recently published literature and methods. Offers students an opportunity to prepare for the professional practice of molecular cell biology. Permission of instructor required for those students not enrolled in biology.

BIOL 6405. Prokaryotic Cell and Molecular Biology. 4 Hours.
Provides in-depth discussion about fundamentally important cellular processes in prokaryotic systems—such as replication, transcription, and translation—and the corresponding regulatory mechanisms. Also discusses molecular mechanisms of gene regulation and bacterial pathogenesis, using selected examples and mechanisms of prokaryotic cell signaling, and advanced and high-throughput techniques used in prokaryotic molecular and cell biology.

BIOL 6407. Biochemistry for Molecular Biologists. 4 Hours.
Focuses on the interface between molecular biology, molecular genetics, and biochemistry. Concentrates on biochemical problems that molecular biologists are likely to find in their research. Includes examples of prokaryotic and eukaryotic (whenever available) systems. Experimental approaches are discussed for all topics. Seeks to enable students to develop a deep understanding of concepts in biological systems through reading and discussion of the primary literature.

BIOL 6960. Exam Preparation—Master’s. 0 Hours.
Offers the student the opportunity to prepare for the master’s qualifying exam under faculty supervision.

BIOL 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOL 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

BIOL 7000. Qualifying Exam. 0 Hours.
Provides eligible students with an opportunity to take the master’s qualifying exam.

BIOL 7243. Embryonic Stem Cells and Regeneration. 4 Hours.
Explores the biological basis for an understanding of embryonic stem cells and regeneration and their potential for curing a variety of diseases. Covers both theoretical and methodological topics. Student presentations and discussions constitute a large portion of the course.

BIOL 7303. Structural Biology. 4 Hours.
Offers in-depth analysis of principles and current literature of protein and/ or cell structure and function.

BIOL 7304. Genome Structure and Function. 4 Hours.
Describes the structure and function of DNA, that is, nucleic acid chemistry, chromatin structure and its regulation, replication, and repair. Emphasis is on the importance of contemporary methodology in studying genomes from different organisms.

BIOL 7305. Advanced Immunology. 2 Hours.
Presents, critically reviews, and discusses current concepts in immunological research within the context of the field of immunology.

BIOL 7382. Research Problem Solving. 2 Hours.
Discusses experimental design and analysis. Requires student presentations. May be repeated without limit.

BIOL 7383. Topics in Biochemistry Cell and Molecular Biology. 2 Hours.
Offers selected advanced topics in the area of biochemistry, cell, and molecular biology; topics vary from year to year. Requires student presentations. May be repeated without limit.

BIOL 7384. Topics in Integrative Biology. 2 Hours.
Offers selected advanced topics in the areas of ecology, systematics, evolution, physiology, and marine biology; topics vary from year to year. Requires student presentations. May be repeated without limit.

BIOL 7399. Research Problem Solving, Ethics, and Communication Skills. 4 Hours.
Focuses on research problem-solving skills, including formulation of hypotheses; experimental design, execution, and analysis; and research ethics. Offers instruction in scientific writing, including daily record keeping, grants and papers, and oral communication skills. Discusses the use and misuse of statistics and discusses responsibility to the public. Requires permission of instructor for those students not enrolled in biology.

BIOL 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIOL 7965. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

BIOL 7978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

BIOL 7990. Thesis. 1-4 Hours.
Offers thesis supervision by members of the department. May be repeated without limit.

BIOL 7996. Thesis Continuation. 0 Hours.
Offers continuing thesis supervision by members of the department.

BIOL 8420. Biological Lab Rotation 1. 4 Hours.
Offers experience in biology research in a faculty research laboratory. Intended only for students who have not yet chosen a lab in which to carry out dissertation/thesis work.

BIOL 8421. Biological Lab Rotation 2. 4 Hours.
Offers a second semester of research experience in a different laboratory than that for BIOL 8420. Intended only for students who have not yet chosen a lab in which to carry out thesis work.

BIOL 8506. Bioinformatics Graduate Co-op Tutorial. 1 Hour.
Designed to complement learning during or after graduate co-op placement. Offers students an opportunity to participate in activities to integrate academic learning and experiential learning including written reflections and oral presentations. Requires approved graduate co-op. May be repeated without limit.
Biol 8960. Exam Preparation—Doctoral. 0 Hours.
Offers the student the opportunity to prepare for the PhD qualifying exam under faculty supervision.

Biol 8964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

Biol 8966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

Biol 8982. Readings. 1-4 Hours.
Offers readings from current literature on an area of interest to students and faculty. May be repeated without limit.

Biol 8984. Research. 1-4 Hours.
Focuses on research methods and their application to a specific problem under the direction of a graduate faculty member. May be repeated without limit.

Biol 8986. Research. 0 Hours.
Offers the student the opportunity to conduct full-time research. May be repeated without limit.

Biol 9000. PhD Candidacy Achieved. 0 Hours.
Indicates successful completion of the doctoral comprehensive exam.

Biol 9984. Research. 1-4 Hours.
Focuses on research methods and their application to a specific problem under the direction of a graduate faculty member. May be repeated without limit.

Biol 9990. Dissertation. 0 Hours.
Offers theoretical and experimental research for the PhD degree. May be repeated once.

Biol 9996. Dissertation Continuation. 0 Hours.
Offers dissertation supervision by members of the department. May be repeated without limit.

Biology - CPS (BIO)

BIO 0904. Exploring Biotechnology: Recombinant DNA and Protein Purification. 6.8 Hours.
Reviews new and exciting developments in the field of molecular biology. Explores the basis and applications of techniques such as DNA purification and isolation, polymerase chain reaction (PCR), and genetic engineering, including protein purification. The classes have a lecture component to provide insights into the advantages/limitations of these technologies. This course complies with the framework of life sciences/biotechnology of the Massachusetts Department of Education.

BIO 1050. Medical Terminology. 3 Hours.
Offers students an opportunity to explore the language of medicine, learning about the importance of word structure in medical fields. A command of medical terminology is fundamental for anyone who aspires to work in the healthcare field. Examines the fundamentals of word analysis and construction, including root words, prefixes, and suffixes, all in the context of the anatomy and physiology of human body systems and healthcare systems. Seeks to provide the fundamentals of science and medicine through reading, writing, listening, and speaking exercises focusing on technical terms used in medical terminology.

BIO 1100. Principles of Biology 1. 3 Hours.
Introduces a variety of biological concepts. Surveys plant and animal characteristics by comparing cell structure and function. Examines specific elements of structure, function, and natural history. Specific topics include cytology, histology, physiology, genetics, cellular respiration, and botany.

BIO 1101. Lab for BIO 1100. 1 Hour.
Accompanies BIO 1100. Studies the specialization of animal cells and ecological succession. Offers students an opportunity to learn about proper experimental design and the limits of experimentation. Includes observing the structure and function of unicellular organisms and the characteristics of biological molecules, measuring aerobic and anaerobic respiration rates, observing cellular reproduction, and genetic analysis of plants and animals.

BIO 1200. Principles of Biology 2. 3 Hours.
Covers major evolutionary trends leading to complex life forms. Surveys organisms beginning with unicellular algae and leading to basic animal structure and function. Describes the anatomy of each body system as well as physiological processes such as hormonal control, nerve impulse transmission, muscular contraction, and the immune response.

BIO 1201. Lab for BIO 1200. 1 Hour.
Accompanies BIO 1200. Uses prepared slides and preserved specimens to study the Prostria and animal kingdoms. Studies the appendicular and axial bones, muscles, blood vessels, urogenital anatomy, and the nervous system.

BIO 1600. Human Anatomy and Physiology 1. 3 Hours.
Provides an overview of anatomic terminology and organization of the body. Presents the structure and function of cells and tissues. Includes the anatomy and physiology of the integumentary and musculoskeletal systems, joint structure and function, and the nervous and endocrine systems, including special senses.

BIO 1601. Lab for BIO 1600. 1 Hour.
Accompanies BIO 1600. Covers a range of topics from the course.

BIO 1700. Human Anatomy and Physiology 2. 3 Hours.
Covers the structure and function of the cardiovascular system (including the properties of blood, the lymphatic system, and immunity) and the respiratory, digestive, and urogenital systems.

BIO 1701. Lab for BIO 1700. 1 Hour.
Accompanies BIO 1700. Covers a range of topics from the course.

BIO 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIO 2100. Microbiology. 3 Hours.
Emphasizes the close relationship between the development of technology and science. Compares prokaryotic and eukaryotic cellular morphology and physiology, including bioenergetics, carbohydrate metabolism, and cellular nutrition and growth. Studies viral replication, microbial genetics, bacterial taxonomy, and evolution. Discusses the principles of epidemiology and public health related to food, water, and sewage microbiology and the role of microbes in fermentation and industrial and environmental microbiology.

BIO 2101. Lab for BIO 2100. 1 Hour.
Accompanies BIO 2100.
BIO 2300. Cell Biology. 3 Hours.
Introduces the chemical composition and structure of cells and organelles. Focuses on transport processes, cell cycle and cell death, and cytoskeleton and matrix. Includes cellular control systems, including cellular energy supply, action of chemical messengers and regulators, cellular principles of respiration, and photosynthesis.

BIO 2500. Genetics and Molecular Biology. 3 Hours.
Covers a detailed analysis of the biochemical mechanisms that control the maintenance, expression, and evolution of prokaryotic and eukaryotic genomes. Topics covered in lectures and readings of relevant literature include gene regulation, DNA replication, genetic recombination, and mRNA translation. Emphasizes the logic of experimental design and data analysis.

BIO 2501. Lab for BIO 2500. 1 Hour.
Accompanies BIO 2500.

BIO 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIO 3100. Biochemistry. 3 Hours.
Covers the fundamental chemistry of biomolecules such as proteins, enzymes, lipids, carbohydrates, and nucleotides. Studies important molecular structures and their role in metabolic cycles. Introduces metabolism and catabolic and anabolic pathways of carbohydrates, lipids, proteins, and nucleotide metabolism. Discusses the importance of nutrition and how it affects metabolic pathways, genetic disorders, and mechanisms of action of various drugs that affect these pathways.

BIO 3101. Lab for BIO 3100. 1 Hour.
Accompanies BIO 3100. Introduces modern research techniques used in biochemistry. Topics include purification and characterization of proteins, kinetic properties of enzymes, isolation of high-molecular-weight DNA, and protein separation; DNA mapping; spectrophotometry; peptide mapping and sequencing; enzyme kinetics; and extraction, separation, and isolation techniques.

BIO 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BIO 4215. Human Parasitology. 3 Hours.
Examines the general biology, life cycles, modes of transmission, and pathogenesis of major parasites on global human health. Explores a number of important diseases, along with the diverse protozoans, worms, and arthropods responsible for them.

BIO 4850. Biological Sciences Senior Project. 3 Hours.
Focuses on an in-depth project in which a student conducts research or produces a product related to the student's major field.

BIO 4896. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student's approved experiential activity and integrates it with study in the academic major.

BIO 4990. Elective. 1-4 Hours.
Covers special topics in biology. May be repeated without limit.

BIO 4991. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

BIO 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

BIO 4993. Independent Study. 1-4 Hours.
Offers students an opportunity to design and complete a research project in biology.

BIO 4994. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

BIO 4995. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

BIO 4996. Experiential Education Directed Study. 1-4 Hours.
Offers students the opportunity to conduct research or produce a product related to the student's major field.

BIO 4997. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

BIO 4998. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

BIO 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

BIO 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

BIO 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

BIO 5985. Project. 1-4 Hours.
Offers students an opportunity to select a topic from any area of their biology or biotechnology studies. Students read current research and prepare an oral presentation and paper, including analysis of the science as well as other perspectives. The oral presentation requires students to apply knowledge gained in prior course work, to understand and integrate classroom learning in their research, and to communicate their findings effectively to their peers and instructors. The final paper can be written as a review of current research progress, identifying current challenges and projections about future research directions, or as a well-defined and researched grant proposal. Group seminars focus on how to read and interpret a scientific paper, how to research an emerging topic, and how to write a professional paper of publication quality.

BIO 6501. Applied Biology Institute. 4 Hours.
Offers teachers an opportunity to prepare for the College Board's Advanced Placement Biology Program. Provides the latest information on AP biology. Offers an opportunity to gain practical experience with most of the 12 recommended AP biology laboratory exercises, tips on planning an AP course, a review of the AP biology testing process, practical teaching ideas, and other helpful information for AP biology teachers. Includes sample lectures, class discussions, scheduling and time management, textbooks and other resources, testing and evaluation in an AP course, and sharing ideas and experiences with other teachers. Seeks to instill the skills, knowledge, and confidence needed to successfully conduct and assess the content of these AP labs.
BIO 6502. Ecology, Evolution, and Diversity of Life. 4 Hours.
Explores ecology, evolution, and the diversity of life, building on nationally
tested, standards-based curriculum materials at the middle and
secondary school levels, aligned with state and national standards.
The subject matter includes the mechanisms behind evolution, the
development and functioning of plants, the flow of matter and energy
through ecosystems, and concepts of population structure and
dynamics. Exposes students to the current state of knowledge in the
scientific community through laboratory and field activities, outside
reading, classroom presentations, and challenging class discussions.

Offers an in-depth exploration of the biological principles, content
knowledge, and pedagogical strategies needed for teaching cell and
molecular biology and genetics at the middle and high school levels.
Topics include structure-function relationships of cells, cell membranes,
and biological macromolecules; enzymes; cellular energetics; cell
reproduction; human genetics; and the transfer of genetic information in
cells. The course takes a human biology approach to these areas, using
activities and examples drawn from the human body. Offers students
an opportunity to gain a rich understanding of biological concepts while
modeling the use of hands-on, inquiry-based teaching strategies.

BIO 6504. Exploring Biotechnology: Recombinant DNA and Protein
Purification. 4 Hours.
Reviews new and exciting developments in the field of molecular
biology. Explores the basis and applications of techniques such as DNA
purification and isolation, polymerase chain reaction (PCR), and genetic
engineering, including protein purification. The classes have a lecture
component to offer insights into the advantages/limitations of these
technologies. This course complies with the framework of life sciences/
biochemistry of the Massachusetts Department of Education.

BIO 6505. Regulation and Homeostasis in Biological Model Systems. 4
Hours.
Focuses on the regulatory processes in biological model systems in
specimens such as mice, fruit flies, worms, yeasts, and plant genetic
models. Studies self-regulation and how it operates, from a whole
organism’s physiology down to cellular processes. Topics include
molecular basis of excitable membranes, neurotransmission as a model
of ligand/receptor interactions, chemical communication between cells,
lesion or mutation as a method to uncover normal function, neural
bases of sensory and motor systems’ gene regulation, non-Mendelian
genetics and biotechnology, and growth and development of multicellular
organisms. Uses new technologies and case studies in the discussion
of those topics. Includes explanation of concepts, laboratory activities,
classroom discussion on the application of the material to the classroom,
and readings.

BIO 6509. Zoology for the Elementary Classroom . 4 Hours.
Focuses on the use of practical zoology in the elementary classroom.
Offers students an opportunity to classify classroom-compatible
organisms including snails, earthworms, red worms, butterflies,
mealworms, crayfish, crickets, beetles, praying mantises, and spiders
and to explore their structures, needs, life cycles, habitats, adaptations,
behaviors, and heredity. A culminating project is to design a zoo habitat
for a selected organism and construct a model of that habitat.

BIO 6961. Internship. 1–4 Hours.
Provides students with an opportunity for internship work. May be
repeated without limit.

BIO 6962. Elective. 1–4 Hours.
Offers elective credit for courses taken at other academic institutions.
May be repeated without limit.

BIO 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

BIO 6966. Practicum. 1–4 Hours.
Provides eligible students with an opportunity for practical experience.

BIO 6970. Seminar. 1–4 Hours.
Offers an in-depth study of selected topics.

BIO 6980. Capstone. 1–4 Hours.
Offers students an opportunity to integrate their course work, knowledge,
and experiences into a capstone project.

BIO 6983. Topics. 1–4 Hours.
Covers special topics in biology. May be repeated without limit.

BIO 6995. Project. 1–4 Hours.
Focuses on in-depth project in which a student conducts research or
produces a product related to the student’s major field. May be repeated
without limit.

BIO 7961. Internship. 1–4 Hours.
Provides students with an opportunity for internship work. May be
repeated without limit.

BIO 7962. Elective. 1–4 Hours.
Offers elective credit for courses taken at other academic institutions.

Biotechnology (BIOT)

BIOT 5040. Fundamentals of Biochemistry for Biotechnology. 4 Hours.
Covers the fundamentals of biochemistry for biotechnology applications,
including protein structure and function, DNA technologies, bioenergetics,
and biosynthesis. Requires permission of instructor for those students
not majoring in biotechnology.

BIOT 5050. Organic Chemistry for Biotechnology. 4 Hours.
Offers an introduction to organic chemistry that seeks to prepare
students for the MS in biotechnology program. Explores the nature of and
the biological aspects of organic compounds. Covers the fundamentals
of the structure, nomenclature, properties, and reactions of carbon
compounds. Also introduces the chemistry of biological molecules,
including amino acids, proteins, carbohydrates, and lipids, as well as
spectroscopic structure determination known as nuclear magnetic
resonance (NMR). Requires prior completion of chemical principles 2/
general chemistry 2 with lab; restricted to biotechnology students or by
permission of instructor.

BIOT 5120. Introduction to Biotechnology. 3 Hours.
Provides an interdisciplinary, state-of-the-art introduction to
biotechnology to students of the Master of Science in Biotechnology
program. Covers the molecular foundations of biotechnology, molecular
microbiology, receptor pharmacology, drug development processes,
bioch process development and scale-up, drug approval and regulatory
affairs, genomics, microarray analysis, proteomics, computational
biology, molecular modeling, analytical biotechnology, and bioterrorism
and biotechnology.

BIOT 5130. Team Skills in Biotechnology. 2 Hours.
Focuses on project management and leadership skills in the
biotechnology industry. Emphasizes professional etiquette, teamwork,
and team leadership in a diverse, multidisciplinary workplace. Also offers
students an opportunity to develop their technical communication skills
(scientific writing, public speaking, and technical presentations).
BIOT 5145. Basic Biotechnology Lab Skills. 1 Hour.
Introduces selected key skills and techniques central to life sciences research. Combines hands-on training in basic laboratory skills with lecture and live demonstration. Laboratory exercises highlight the importance of precision/accuracy in dispensation of liquids and in the preparation of solutions and standards, documentation and record keeping, and maintaining a safe and sterile work environment while performing scientific research.

BIOT 5219. The Biotechnology Enterprise. 2 Hours.
Exposes students to a broad spectrum of concepts and issues that are common to biotechnology companies. Provides an overview of innovation, intellectual property, planning, government regulation, and strategic alliances. Introduces biotechnology entrepreneurship; management; and the legal aspects of science, technology, and research in the biotechnology context.

BIOT 5220. The Role of Patents in the Biotechnology Industry, Past and Future. 1 Hour.
Covers the basics of patenting and the application of patents to the biotechnology industry, including the controversial area of gene patents.

BIOT 5225. Managing and Leading a Biotechnology Company. 3 Hours.
Covers managing projects and personnel in a technology-based organization. Such activities are best carried out by those who combine the technical knowledge of their industry with the insight into the best practices for working with groups of highly educated, and often very experienced people. The biotechnology industry is strongly dependent on the concept that knowledge is always shared and ownership is collective. As the fundamental organizational mantra is teamwork, the principles of managing in this environment are key to achieving important goals. How to accomplish this and make decisions that drive innovation and success have common threads with other technology based industries, but with the added complexity of the scientific challenges facing the biotechnology industry. Restricted to students in the Bouvé College of Health Sciences and in the College of Science or by permission of the program office.

BIOT 5226. Biotechnology Entrepreneurship. 3 Hours.
Biotechnology by its very nature is an innovative multidisciplinary industry. This is especially true for the biopharmaceutical industry in which the process of discovering new drugs and new drug targets requires novel approaches to solving difficult questions about disease processes and human health. This course focuses on the essential nature of innovation in the biotech industry, exposes students to the basics of creating startup organizations, explains the key role of business planning in enterprise creation, describes means for assessing risks, making choices from available options and how to measure success. Various business models, outsourcing work and establishing strategic partnerships are examined. Restricted to students in the Bouvé College of Health Sciences and in the College of Science or by permission of the program office.

BIOT 5227. Economics and Marketing for Biotechnology Managers. 3 Hours.
Provides a foundation for making financial decisions in the biotechnology industry. Examines accounting methods, forecasting, corporate valuation, exit strategies and drug pipeline economics. Introduces concepts for marketing pharmaceutical products. Restricted to students in the Bouvé College of Health Sciences and in the College of Science or by permission of the program office.

BIOT 5330. Drug Safety and Immunogenicity. 3 Hours.
Introduces the fundamental molecular interactions involved in immunological responses as well as in measuring and testing in a research and regulated environment. Other drug-safety-related topics include adventitious agents (viruses, microorganisms, mycoplasma) and risk factors such as product-related substances (aggregates and post-translationally modified variants), endotoxins, DNA, host-cell proteins, process contaminants such as antibiotics, and the means of testing and removing these through validated processes.

BIOT 5560. Bioprocess Fundamentals. 3 Hours.
Focuses on the fundamental principles and elements in the process of manufacturing biopharmaceuticals. Covers kinetics of enzymatic reactions; selected microbial and cell metabolism and relevant control mechanisms; kinetics of cell growth, cell death, substrate consumption, and product formation; mathematical modeling and representation of bioprocesses; examples of industrial bioprocesses to illustrate types and operations of upstream and downstream unit operations and mass transfers in fermentation systems—the affecting factors and the impact on process development and scale-up. Also includes an overview of economic considerations. Emphasizes bioprocesses for recombinant protein production.

BIOT 5631. Cell Culture Processes for Biopharmaceutical Production. 3 Hours.
Covers the principles and concepts involved in the development of mammalian and other types of cell culture processes for the manufacturing of biopharmaceutical products such as monoclonal antibodies and recombinant proteins. Topics include protein expression and clone generation, batch and perfusion processes and media development, bioreactor operations and scale-up, and innovations in cell culture processes. Regulatory concepts include quality assurance in a cGMP environment.

BIOT 5635. Downstream Processes for Biopharmaceutical Production. 3 Hours.
Addresses the development of recombinant protein purification processes in biotechnology. Provides an overview of the scientific principles, engineering strategies, and unit operations facilities involved in scalable protein purification processes. Also discusses viral clearance and inactivation strategies; cGMP considerations; and technological advances to improve effectiveness and efficiency, such as membrane-based disposable systems.

BIOT 5640. Drug Product Processes for Biopharmaceuticals. 3 Hours.
Covers the development and implementation of the drug product manufacturing process for biopharmaceuticals. Focuses on biologic products, specifically proteins. Covers the workflow required for the development and implementation of the production process with the scientific and engineering principles highlighted. Topics include the preformulation process for early stage product development, the selection of formulation compatible with the targeted product presentation, optimization of formulations to meet stability and usage objectives, the design of a scalable process for production, large-scale process equipment and operations, process scale-up considerations, and regulatory compliance issues for drug product manufacturing facilities and operations. Students who do not meet course prerequisites may seek permission of instructor.
BiOT 5700. Molecular Interactions of Proteins in Biopharmaceutical Formulations. 3 Hours.
Offers an up-to-date survey and review of the research and understanding of the molecular interactions of proteins in biopharmaceutical formulations, including both liquid and solid formats, during the process of drug product manufacturing. Focuses on protein-protein interactions, protein-excipients (e.g., stabilizers, surfactants) interactions, and protein at interface surfaces interactions that are critical and impactful on the stability and integrity of therapeutic proteins of interest. Emphasizes understanding the mechanistic aspect of the interactions; the approaches, methods, and techniques employed to study these phenomena; and measures considered to modulate such interactions to enhance the performance of the biopharmaceutical formulations. Students who do not meet course prerequisites may seek permission of instructor.

BiOT 5810. Cutting-Edge Applications in Molecular Biotechnology. 3 Hours.
Introduces the uses of molecular biology in a biotechnology setting. Includes a brief review of the basics and then dives into state-of-the-art molecular biology applications used in biotechnology today. These applications include stability and expression of cloned gene products, gene cloning strategies, transgenic species, mutation creation and analysis, DNA fingerprinting, PCR technology, microarray technology, gene probes, gene targeting, gene therapy, stem cell technology, antisense RNA, CAR T-cell therapy, RNA interference, and CRISPR/Cas9.

BiOT 5850. Higher-Order Structure Analytics. 3 Hours.
Offers a comprehensive look at various aspects of higher-order protein structures in biotherapeutics and their implications on biological drug design. Focuses heavily on protein aggregation, a type of HOS, and analysis of those aggregates including functional implications. Topics include a review of protein structure, protein aggregation, functional aspects, and techniques to reduce HOS using protein expression and purification strategies, protein folding in disease, macromolecular crystallography, nuclear magnetic resonance, analytical ultracentrifugation, circular dichroism, light scattering, electron spin labelling, cryo-EM, WAXS, and HDX-MS. Highlights experimental design and application to the biotechnology industry in identifying and reducing HOS.

BiOT 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

BiOT 6214. Experimental Design and Biometrics. 2 Hours.
Explores the principles of experimental design and statistical analysis. Emphasizes research in the molecular and biological sciences and biotechnology. Topics include probability theory, sampling hypothesis formulation and testing, and parametric and nonparametric statistical methods.

BiOT 6400. Pre-co-op Experience. 0 Hours.
Offers students an opportunity to gain necessary skills and practical experience in order to prepare for graduate co-op.

BiOT 6411. Biotechnology Co-op Reflection Seminar. 1 Hour.
Designed to complement learning during or after graduate co-op placement. Students participate in activities to integrate academic learning and experiential learning, including written reflections and weekly reports that do not have to include company confidential information.

BiOT 6500. Professional Development for Co-op. 0 Hours.
Introduces the cooperative education program. Offers students an opportunity to develop job-search and career-management skills; to assess their workplace skills, interests, and values and to discuss how they impact personal career choices; to prepare a professional resume; and to learn proper interviewing techniques. Explores career paths, choices, professional behaviors, work culture, and career decision making.

BiOT 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BiOT 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

BiOT 7245. Biotechnology Applications Laboratory. 3 Hours.
Presents a laboratory course in biotechnology with a focus on cutting-edge instrumentation that is currently used in the field. Directs special attention at the practical aspects of laboratory work in this field, for example, techniques in sample preparation, procedures for protein analysis, and new bioinformatic approaches. Focuses on the emerging field of chemiproteomics, which is the study of the interaction of small molecules with the proteome, that is, the full complement of proteins expressed in an individual cell or organism. Exposes the student to hands-on experience with modern instrumentation, such as mass spectrometry and high performance liquid chromatography.

BiOT 7300. Special Topics in Biotechnology. 1-3 Hours.
Presents selected topics of current importance in biotechnology. May be repeated up to five times for up to 6 total credits.

BiOT 7303. Special Topics in Biopharmaceutical Regulatory Science. 3 Hours.
Presents selected topics of current importance in biotechnology and biopharmaceutical regulatory science. May be repeated up to two times.

BTC 1300. Introduction to Biotechnology. 3 Hours.
Introduces the integrated science of genomics, proteomics, and bioinformatics using a case study, hands-on, problem-solving approach. Offers students an opportunity to practice accessing and using online databases to engage in real-time discoveries using the same approach current scientists use in their own research. Focuses on the process of doing genomic analysis and thinking from a genomics perspective. Uses integrated multimedia and web resources to introduce new technologies and to allow students to research and analyze real genomics data.

BTC 1301. Lab for BTC 1300. 1 Hour.
Accompanies BTC 1300. Designed to introduce cutting-edge skills and techniques used in research labs and biopharmaceutical companies. Offers students an opportunity to learn the theoretical background of a technique in the lecture portion of the course and to be able to practice the techniques in the lab—to learn to read and write protocols; to accurately and precisely measure liquids and solids; to prepare solutions and media; to keep a virtual lab notebook, all while working in a safe and aseptic lab setting; and to learn how to perform electrophoresis, protein quantification, DNA extraction, and the basic use of a bioreactor.

BTC 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
BTC 2700. Cell and Tissue Culture Techniques. 3 Hours.  
Seeks to provide students with an understanding of mammalian cell culture. Introduces modern cell culture techniques that are used in research labs and in biopharmaceutical companies. Offers students an opportunity to learn the theoretical background and basic lab math via a short lecture at the beginning of each class. Topics include aseptic technique, cell passaging, cell counting, thawing cells, freezing cells, plating cells, and mammalian cell transfection. Studies these techniques for both adherent and suspension mammalian cells.

BTC 2701. Lab for BTC 2700. 1 Hour.  
Accompanies BTC 2700. Provides a hands-on understanding of mammalian cell culture. Explores aseptic technique, cell passaging, cell counting, thawing cells, freezing cells, plating cells, and mammalian cell transfection. Offers students an opportunity to practice reading protocols, writing protocols, and critical thinking in the laboratory.

BTC 2990. Elective. 1-4 Hours.  
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BTC 3300. Technology of Biomaterials. 3 Hours.  
Covers the analysis and design at a molecular scale of materials used in contact with biological systems, including biotechnology and biomedical engineering. Topics include molecular interactions between biological and synthetic molecules and surfaces; design, synthesis, and processing approaches for materials that control cell functions; and application of state-of-the-art materials science to problems in tissue engineering, drug delivery, vaccines, and cell-guiding surfaces.

BTC 3990. Elective. 1-4 Hours.  
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BTC 4200. Genomics, Proteomics, and Bioinformatics. 3 Hours.  
Focuses on bioinformatics and its importance in the sciences. Seeks to apply and understand bioinformatics tools as they pertain to analyses of genomes, protein structure/function, gene families, and molecular evolution. Uses bioinformatics tools to mine databases for information relevant to answering questions relating to molecular structure, function, and evolution. Analyzes relationships between known protein structure and model protein structures. Illustrates how multiple alignments and database searching are used to gather data about gene sequences. Describes how to identify genes and infer gene structure. Differentiates between the types of phylogenetic analyses available and appropriate programs for specific questions. Applies students' existing content knowledge toward practical bioinformatic applications. Offers students an opportunity to develop skills in analysis, problem solving, and communication as applied to bioinformatics.

BTC 4300. Biotechnology and Pharmaceutical Processing. 3 Hours.  
Focuses on the fundamental principles and elements in the process of manufacturing biopharmaceuticals using current good manufacturing practices (CGMPs). Covers kinetics of enzymatic reactions; selected microbial and cell metabolism and relevant control mechanisms; kinetics of cell growth, cell death, substrate consumption, and product formation; mathematical modeling and representation of bioprocesses; and examples of industrial bioprocesses to illustrate types and operations of upstream and downstream unit operations and mass transfers in fermentation systems. Emphasizes bioprocesses for recombinant protein production. Explores in-depth selected methods, techniques, and instruments used in biotechnology. Covers up-to-date CGMPs used in biotech/biopharmaceutical industries and how those practices influence quality control/management of downstream products.

BTC 4450. Quality Control and Validation Issues. 3 Hours.  
Introduces the regulations and guidelines affecting the development, production, registration, and sale of medical devices, diagnostics, pharmaceuticals, and biotechnology products worldwide. Focuses on why regulations are necessary, ethical considerations, and international standards. Offers practical instruction in the basics of quality control and process/facility validation for the biotechnology industry. Reviews appropriate regulations, including personnel and process flow, environmental and water testing, sterility testing, and incoming material and in-process testing. Other topics include the establishment of a master validation plan; description of facility, equipment, and process validations; and cleaning validations.

BTC 4850. Biotechnology Senior Project. 3 Hours.  
Focuses on an in-depth project in which a student conducts research or produces a product related to the student's major field.

BTC 4950. Seminar. 1-4 Hours.  
Offers an in-depth study of selected topics.

BTC 4955. Project. 1-4 Hours.  
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

BTC 4983. Topics. 1-4 Hours.  
Covers special topics in biotechnology. May be repeated without limit.

BTC 4990. Elective. 1-4 Hours.  
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BTC 4991. Research. 1-4 Hours.  
Offers students an opportunity to conduct research under faculty supervision.

BTC 4992. Directed Study. 1-4 Hours.  
Offers independent work under the direction of members of the department on a chosen topic.

BTC 4993. Independent Study. 1-4 Hours.  
Offers independent work under the direction of members of the department on a chosen topic.

BTC 4994. Internship. 1-4 Hours.  
Provides students with an opportunity for internship work.

BTC 4995. Practicum. 1-4 Hours.  
Provides eligible students with an opportunity for practical experience.

BTC 4996. Experiential Education Directed Study. 1-4 Hours.  
Draws upon the student's approved experiential activity and integrates it with study in the academic major.

BTC 5976. Directed Study. 1-4 Hours.  
Offers independent work under the direction of members of the department on a chosen topic.

BTC 5978. Independent Study. 1-4 Hours.  
Offers independent work under the direction of members of the department on a chosen topic.

BTC 5984. Research. 1-4 Hours.  
Offers students an opportunity to conduct research under faculty supervision.
BTC 6115. Genomics and Bioinformatics: Basic Science and Technology. 4 Hours.
Introduces the history, essential theory, and application of bioinformatics from early Mendelian genetics through genome mapping and sequencing technologies. Offers students an opportunity to learn methods for modeling metabolic and regulatory pathways with a focus on protein structure prediction through a combination of mRNA and protein expression data.

BTC 6125. Expression Analysis. 4 Hours.
Surveys available expression measurement techniques with a discussion of their relative strengths and weaknesses. The explosion in microarray technologies allows scientists to measure the expression level of thousands of genes simultaneously from a single biological sample on one “gene chip.” The course offers students an opportunity for hands-on practice searching databases for sequence similarities. Discusses data visualization and clustering and analysis, including applications to toxicology, drug target, and diagnostic marker discovery.

BTC 6135. Proteomics. 4 Hours.
Explores the basics of how one analyzes proteins and proteomes and how these approaches are used to investigate their roles in living systems. The systematic analysis of protein profiles of healthy and diseased tissues is rapidly transforming the practice of biology by making it possible to understand complex biological systems as collections of proteins. Building on the key concepts of proteomics, explores how the analytical instrumentation works, what data mining and other software tools do, and how these tools can be integrated to study proteomes to open new opportunities in drug discovery and development.

BTC 6210. Human Experimentation: Methodological Issues Fundamentals. 4 Hours.
Explores issues related to human experimentation, including methodological issues and the ethical, clinical, and financial repercussions of clinical trial studies. Covers how effective study designs can mitigate the common limitations and problems of clinical trials. Considers ethical issues, such as selective reporting of clinical research, informed consent, and protection of research participants in domestic and international clinical trials.

BTC 6211. Validation and Auditing of Clinical Trial Information. 4 Hours.
Presents a comprehensive overview of the management of quality assurance in clinical trials, Good Clinical Practices (GCP), and management of audit outcomes, as well as current issues and trends in the validation and auditing of clinical studies.

BTC 6213. Clinical Trial Design Optimization and Problem Solving. 4 Hours.
Discusses quantitative data analysis in creating dynamic drug-disease models, strategic market models, trial simulation models, and integrated financial models, which enable key variable analysis in clinical trial developments in real time. This integrated approach allows all decisions in the design to optimize value against both scientific and business criteria simultaneously and continuously. Offers students an opportunity to learn to take a complete view of the development process at the outset - across time, across the portfolio, and at all levels in the organization. This allows for greater insight into a drug’s potential early in the process and leads to a more focused program for promising compounds, including an optimized clinical trial design. It also allows for earlier cessation of unpromising clinical trials, saving time and funds.

BTC 6260. The Business of Medicine and Biotechnology. 4 Hours.
Considers current case studies in order to understand how and why certain medical products succeed while others do not. Understanding how integrating cost, reimbursement, intellectual property, product liability, and FDA issues into an overall product development strategy is vital in bringing a new medical product to the U.S. market. And in light of high-profile product failures such as VIOXX and others, reimportation of drugs, reuse of single-use medical devices, and the impact of generic biologics, keeping your medical product on the market can be as much of a challenge as getting it there. The course concludes with a group debate where students recreate an FDA panel meeting to try and understand the FDA approval process.

BTC 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

BTC 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BTC 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

BTC 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

BTC 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

BTC 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

BTC 6983. Topics. 1-4 Hours.
Covers special topics in biotechnology. May be repeated without limit.

BTC 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

Business - CPS (BUS)

BUS 0108. Advanced Real Estate. 0.8 Hours.
Description unavailable.

Business Administration (BUSN)

BUSN 0100. American Society and Management. 0 Hours.
Introduces students to the values and practices that guide business in the United States while previewing the attitudes and behaviors of managers and employees. Seeks to develop an understanding of the context of U.S. business.

BUSN 0200. Managerial Economics. 0 Hours.
Features the primary economic concepts that govern business. Emphasizes the meaning and use of major economic principles in the business setting.

BUSN 0300. Accounting Principles. 0 Hours.
Features the essentials of accounting concepts and terms. Accounting is the international language of business. In this respect, it provides the foundation upon which all future business courses build.

BUSN 0400. Introduction to Marketing. 0 Hours.
Presents the concepts of marketing, which are central to business success. Features the basic concepts of marketing products, such as pricing, promotion, and placement, through case analysis.
BUSN 0500. Quantitative Business Methods. 0 Hours.
Provides participants the opportunity to acquire mathematical and statistical knowledge that serves as preparation for quantitative analysis. Emphasizes practical applications of sound data and analytical techniques.

BUSN 0945. Managerial Skills Workshop. 0 Hours.
Designed as a noncredit course to address student preparation deficiencies in the areas of accounting, economics, or statistics, as appropriate. Students who fail the mandated assessment of preenrollment preparation in one or more of these areas may be required to successfully complete this course. Seeks to help students review and develop their skills in the relevant areas prerequisite to the full-time MBA program. May be repeated without limit.

BUSN 1100. Introduction to Planning for Business Co-op and Careers. 1 Hour.
Offers students an opportunity to develop the skills and knowledge necessary to be successful in the professional world of work and to navigate their career. It is the first step in preparing for co-op job search in the D'Amore-McKim School of Business (DMSB). Offers students an opportunity to complete a self-assessment to determine their skills and interests within business; to learn about the various concentrations, career paths, and co-ops within DMSB; to learn to use myNEUCOOL, the search tool for finding available co-op positions; to develop a draft résumé for review; and to select a concentration for the upcoming semester’s co-op placement search.

BUSN 1101. Introduction to Business. 4 Hours.
Blends theoretical principles with real-life application. Introduces the fundamentals of launching, growing, and managing a business venture in today’s dynamic and increasingly global environment. Examines concepts within multiple academic disciplines and from multiple perspectives—including marketing, technology, finance, accounting, information systems, people, and culture—and then applies them to new ventures within varied types of organizations. Offers students an opportunity to develop an entrepreneurial skill set and mind-set through the development of the critical thinking, innovative decision making, problem solving, and team building needed for any business, large or small.

BUSN 1102. Personal Skill Development for Business. 1 Hour.
Offers first-year students in the D’Amore-McKim School of Business (DMSB) an opportunity to achieve a better understanding of themselves as students and as future professionals. Explores self-analysis, leadership traits and styles, diversity and cultural awareness, professionalism, emotional intelligence, and ethics. Encourages students to draw connections among classroom education, extracurricular activities, and practical experiences and to identify how each component fits into the pursuit of their individual goals.

BUSN 1103. Professional Development for Business Co-op. 1 Hour.
Introduces students to the Cooperative Education Program and provides them with an opportunity to develop job-search and career-management skills. Offers students an opportunity to perform assessments of their workplace skills, interests, and values and discuss how they impact personal career choices. Students also have an opportunity to prepare a professional-style résumé, learn proper interviewing techniques, and gain an understanding of the opportunities available to them for co-op. Introduces career paths, choices, professional behaviors, work culture, and career decision making. Familiarizes students with workplace issues relative to their field of study and teaches them to use myNEU in the job-search and referral process. Presents co-op policies, procedures, and expectations of the Department of Cooperative Education and co-op employers.

BUSN 1110. Fundamentals of Business. 4 Hours.
Designed to familiarize students with the contemporary world of business. Introduces legal, political, ethical, and social citizenship foundations and theories that businesses and nonprofit organizations are built upon. Exposes students to the various business disciplines and the role these disciplines play in an organization. Covers several quantitative fundamentals and tools for ethical and socially responsible business decision making. Integrates critical issues affecting the world of business from both a national and international perspective. Offers nonbusiness students an opportunity to develop basic business literacy within an ethical context. Also functions as a foundational, “cornerstone” course for those considering minoring in business.

BUSN 1201. Living and Working in the United States. 4 Hours.
Offers international students an opportunity to transition to living and working in the United States. Covers U.S. social and academic culture from a college student’s point of view. Emphasizes surviving and thriving in the business classroom and taking advantage of the student organizations available on campus. Also covers the culture of job searching in the United States, including reading the job description, company research, self-marketing, communication (small talk, safe and unsafe topics, etc.), interviewing basics, and accepting a position. Addresses the culture of business organizations and professional expectations. Course activities include role-playing, peer partnering, and site visits.

BUSN 1944. Freshman/Sophomore Internship. 1 Hour.
Offers students an opportunity for internship work. May be repeated up to two times.

BUSN 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BUSN 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BUSN 3110. The Consulting Environment. 4 Hours.
Seeks to provide students with a framework and the fundamentals that allow them to understand the field of consulting in addition to a way of thinking for jobs in the consulting and other highly competitive careers. Focuses on the analysis of complex business situations using caselets and cases and provides frameworks as the basis for analysis and critical thinking in pressure situations. In addition, various articles, white papers, business case studies, and other consulting practices are shared with the students enrolled in the course as well as professionals with industry experience providing insights as visiting guest speakers.

BUSN 3201. D’Amore-McKim School of Business Global Leadership. 1 Hour.
Offers students an opportunity to mentor international and out-of-region freshman students in the D’Amore-McKim School of Business; learn and practice strategies to assist their mentees’ transition to a culturally and educationally different environment; and to acquire appropriate techniques of providing guidance and direction in this realm, to reflect on their experience as mentors, and to consider how effective global leadership includes an understanding of cultural differences and transitions in a global educational and business world. Does not count toward degree. Seeks to help develop global leaders who understand and are able to help with the cultural and transitional challenges that exist when students and young professionals move to new regions of the world. May be repeated once.

BUSN 3944. Junior/Senior Internship. 1 Hour.
Offers students an opportunity for internship work. May be repeated up to two times.
BUSN 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BUSN 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

BUSN 4993. Independent Study. 1-4 Hours.
Allows students who have received approval to undertake independent study in lieu of any course required in the various concentrations. Students present proposals to an Independent Studies Committee for evaluation and approval. Every proposal requires a detailed outline of the objectives and plan of study and must be accompanied by a supporting statement from the supervising faculty member under whose direction the study takes place. A copy of the final report prepared by the student is presented to the appropriate Independent Studies Committee. Further information about the Independent Studies Program can be obtained from concentration coordinators. May be repeated without limit.

BUSN 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

BUSN 5978. Independent Study. 1-4 Hours.
Allows students who have received approval to undertake independent study in lieu of any course required in the various concentrations. Students present proposals to an Independent Studies Committee for evaluation and approval. Every proposal requires a detailed outline of the objectives and plan of study and must be accompanied by a supporting statement from the supervising faculty member under whose direction the study takes place. A copy of the final report prepared by the student is presented to the appropriate Independent Studies Committee. Further information about the Independent Studies Program can be obtained from concentration coordinators. May be repeated without limit.

BUSN 6200. Career Management. 0 Hours.
Required for the Co-op MBA program. Begins with an introduction to the career planning process and to the services of the MBA Career Center. Topics include résumé writing, videotaped practice interviewing, job search strategies, interview preparation, salary negotiation, marketing communication, and visa issues for international students seeking employment in the United States. May include additional topics depending on student interest. Requires admission to co-op MBA program. May be repeated once.

BUSN 6201. Managerial Effectiveness. 1 Hour.
Opens the full-time MBA program and offers students an opportunity to begin to identify the skills they need to develop to become effective managers. Assesses student capabilities in both qualitative and quantitative management skills, based partly on program prework, to form the foundation for developing an individualized plan to improve students’ portfolio of abilities. Covers communications, business analysis, interpersonal effectiveness, and ethics and values.

BUSN 6202. Leadership and Planning for Growth. 1 Hour.
Bridges the first and second years of the full-time MBA program, helping students reflect on their development over their first year in key managerial skills while preparing for leadership roles in their organizations. Focuses on teaching students the process of developing strategic plans for growth and effectively leading growth initiatives for their organizations. Teaches students to convert strategic plans into business models, financial plans, and investment strategies. Focuses on how to apply managerial skills in leading and implementing these plans. Introduces the Business Plan Project that continues in ENTR 6208. Requires prior completion of 25 semester hours of MBA core curriculum.

BUSN 6203. Understanding Sustainability Strategies. 1 Hour.
Introduces students to the skills necessary to operate in the emerging environment of sustainability-focused management. Includes the fundamental elements of sustainability and the frameworks to analyze sustainability challenges. Also examines case studies of firms meeting these challenges.

BUSN 6204. Persuasive Communication with B2B Customers. 1 Hour.
Introduces concepts in the field of personal selling in a business-to-business (B2B) environment. Exposes students to a process developed to help them better understand personal selling by providing solutions and understanding the role of relationship development. Seeks to provide students with a better understanding of the visual, verbal, and nonverbal communication involved in B2B sales presentations. Identifying and qualifying prospects, use of persuasive communication, and the role of ethics in the selling process are also introduced.

BUSN 6205. Emotional Intelligence: Your Key to Success. 1 Hour.
Introduces students to the various definitions of emotional intelligence (EI), which has emerged in the popular business press as a set of competencies assembled under four categories: self-awareness, social awareness, self-management, and relationship management. Covers the measuring of EI; EI and performance (job performance, team performance, and leadership); and activities and exercises that may lead to improving one’s emotional intelligence.

BUSN 6206. Intellectual Property for Global Business. 1,1.5 Hour.
Introduces the nature and function of various types of intellectual property (IP) available internationally. Examples may include patents, copyrights, trademarks/trade dress, and trade secrets/know-how. The course also introduces students to the opportunities for strategic use of IP assets for competitive advantage in an international or multinational business.

BUSN 6207. Developing Critical Skills in Real Time. 2 Hours.
Seeks to provide students with the opportunity to develop their personal management and leadership skills during and throughout their course of study. Utilizing assessments and other data collection techniques for increasing personal insight, the goal of the course is to target areas for development through the practice and application of activities and exercises.

BUSN 6208. Competition in Global Markets. 1 Hour.
Employs a business simulation in which students compete by applying their knowledge of accounting, marketing, finance, operations, quantitative methods, and economics to advance their firm in a globally competitive industry. Designed as a capstone activity, the course serves to integrate the functional disciplines of business in a practical, hands-on manner by providing students a “live” example of their programmatic content. Offers students the opportunity to gain a better understanding of the consequences of their actions in an uncertain and highly competitive international environment by developing multifaceted strategies and tactics for their companies.

BUSN 6209. Negotiations for Conflict Resolution. 1.5 Hour.
Focuses on conflict resolution. Covers the basic elements (strategies and styles) of negotiation. Uses short lectures, role-playing, and simulations to offer opportunities for students to develop their skills and gain feedback. Managers today find themselves negotiating numerous times every week. This occurs every time that two or more people are in a situation where their goals and interests differ. In addition to what we formally think of as negotiation (contracts, clients, customers), managers also engage in less formal negotiations—with bosses, subordinates, peers, group members, suppliers, etc. Each class focuses on practicing negotiation skills in a role-play. Also covers mediation, where a third party helps to resolve a conflict. Online MBA students only.
BUSN 6210. Field Consulting Project. 3 Hours.
Offers an interdisciplinary project course in which teams of students work with host organizations on current problems, learning how to understand and analyze the problem, and offer recommendations. A faculty adviser supervises and provides guidance to the teams. Projects involve a broad variety of host organizations—large and small, for-profit and nonprofit, manufacturing and service—and the project report and presentation typically extend to an analysis of the host organization’s industry, identification of organizational problems and opportunities, and formulation of actionable recommendations. Students also develop teamwork and communications skills in a real-world setting. Requires admission to co-op MBA program.

BUSN 6211. Building Agility in Projects and Organizations. 1 Hour.
Exposes students to the business rationale for using agile principles. Discusses the philosophies and culture that need to be incorporated into the agile business. Presents the core foundation of agility and a model for developing an agile business.

BUSN 6212. Patenting Life (and Death): Aids, Africa, and the High Cost of Lifesaving Medicines. 1 Hour.
Examines the question of whether multinational companies who discover, develop, patent, and market medicines to treat AIDS have a legal, ethical, or business obligation to make those drugs affordable for sick and dying people in Africa and other developing countries. Includes concepts of fiduciary duty, stakeholders, and corporate social responsibility in the framework.

BUSN 6213. Current Crisis: Hot Topics in Economics and Finance. 1.5 Hour.
Explores the current economic and financial crisis by examining the numerous and complex interdependencies that exist in the world’s economies. Focuses on the market forces and outcomes that arise from decisions by individuals, businesses, and governments, emphasizing the role of finance. History provides an extensive list of market and institutional failures—financial and otherwise—from which, through better understanding, we emerge stronger and more successful. Analyzes where we are, how we got here, and where we may be headed. Online MBA students only.

Exposes students to the field of emerging market entrepreneurship, with a focus on microenterprise development in the poorest communities in the world. Offers students an opportunity to learn about the growing field of microfinance and its impact in stimulating business development in desperately poor communities.

BUSN 6215. Transparent Pricing Strategies in the Service Industries. 1 Hour.
Introduces pricing strategy for service industries, such as the hotel or airlines, where prices vary by demand. These industries face unique pricing challenges, as unsold “goods” result in immediate loss on the income sheet. Uses selected real-world case studies to discuss constraints and costs, the impact of the Internet and pricing transparency, the effect of deregulation and continuous price wars, pricing strategy options, and to examine the overall consequences of these strategies for both firms and consumers.

BUSN 6216. Make Innovation Easy. 1 Hour.
Offers students an opportunity to develop the capability to both craft an innovation strategy and to create a culture of innovation. Exposes students to new ways to craft an innovation strategy through the application of a set of diagnostic questions that help companies identify where their organization needs to focus its innovation efforts, the problems innovations are attempting to solve, and the knowledge that is needed to generate these innovations. Uses a mixture of lecture, small-group discussions, readings, short cases, and interactive exercises.

BUSN 6217. Assessing International Trade and Sovereign Risk Potential. 1.5 Hour.
Reviews the major factors that drive the assessment of risk and potential return of foreign locals/countries. Nearly all foreign expansion begins with an assessment of the market potential of the foreign market and/or riskiness of operating in, or with, foreign-based firms. While these assessments are idiosyncratic, they all tend to contain a number of common elements that are introduced in this course.

BUSN 6218. The 21st-Century Leader: Managing Your Communication. 1.5 Hour.
Uses exercises, group projects, and presentations to practically apply theories of communication to everyday situations. Technology has dramatically changed the pace and ways we communicate, but with all the variety and speed of electronic communications, the need for competency in face-to-face communication is still the most critical skill leaders must have to successfully maneuver in organizations and influence others. This is a highly interactive class.

BUSN 6219. Fraud: Examining the Role of Opportunity, Incentives, and Rationalization. 1 Hour.
Focuses on why and how fraud flourishes within organizations. Offers students an opportunity to analyze and discuss the role of opportunity, incentives, and rationalization (i.e., “the fraud triangle”) in the demise of various corporations.

BUSN 6220. Designing Effective Organizations. 1 Hour.
Focuses on one of the answers to why some organizations are more effective than others—organization design. Addresses what the components of an organization are (e.g., the work, the structure, the reward system, the renewal systems, etc.); some of the design choices of each component; and the impact of organizational design on organizational effectiveness. Uses a variety of instructional techniques, including small-group discussion, case studies, videos, and lecture/discussion, and is highly interactive.

BUSN 6221. Occupational Fraud and Abuse. 1 Hour.
Provides an overview of both the pervasiveness and the causes of fraud/white-collar crime in our society; examines the types of fraud and fraud schemes that affect business enterprises; explores methods of fraud detection, investigation, and prevention; and helps increase one’s ability to recognize potential fraud and develop a “fraud-risk-management” philosophy. Fraud and abuse can be categorized into employee fraud (misappropriation of assets) and management fraud (fraudulent financial reporting). Occupational fraud and abuse cost U.S. organizations an estimated $400 billion annually. The average organization loses more than $9 a day per employee. Approximately 6 percent of total annual revenue of businesses is lost to employee fraud alone. Although employee fraud occurs more often, management fraud is four times more costly. Recent corporate scandals support these statistics.
BUSN 6222. Business Ethics in the Global Economy. 1 Hour.
Focuses on current international business ethics topics and ethical decision making with an eye toward the global business arena. Includes both theoretical and practical approaches that should facilitate a deeper understanding of the moral issues that managers face today. Covers moral philosophy perspectives, the legal dimension, ethical issues in business, developing an effective ethics program (and a code of ethics), and international and cross-cultural business ethics. Emphasizes recent research findings and salient examples from industry in order to create a current and colorful view of the state of business ethics. Discusses and debates controversial issues, such as insider trading and child labor, from a variety of perspectives.

BUSN 6224. E-Business Revolution and the New Economy. 1 Hour.
Looks at e-business and the new economy after the dot-com crash. The idea of the “new economy” is being promoted widely, but few people know clearly what it means, how much (or little) empirical support there is for this notion, or what it means in practical business terms. This course covers the following subjects: the new economy and how much empirical support there is for it; the dot-com crash; the essentials of e-business; the e-business experience—what works and what doesn’t; the e-economics of the new economy; impacts on business in the future.

BUSN 6225. Online Marketing Research. 1 Hour.
Explores current industry best practices in conducting quantitative surveys using the Internet. The Internet has transformed how marketing research is conducted and reported and offers the promise of better, faster, and cheaper collection and delivery of survey data and findings. Includes an overview of the online research market, best practices in online research, and online reporting and analysis.

BUSN 6226. Financial Forecasting. 1 Hour.
Offers practical insights on how to predict two important economic and financial variables; namely, exchange rates and stock market indices. Discusses the latest findings from specialist academic journals, which form the underpinnings of the different forecasting techniques. Examines exchange rates and stock markets separately and considers different approaches to forecasting these variables. Pays particular attention to the developments in these markets in the late 1990s and implications of these for forecasting equity returns.

BUSN 6227. Chipping The Stock Market. 1 Hour.
Combines theory and practice as it seeks to unravel for students mysteries that cloud perceptions of market activities. Many investors have lost faith in traditional investing philosophies; yet, investing remains an essential activity in a modern productive economy. Even with the recent market turnaround, investors remain uncomfortable returning to former methods. Chipping, a modern investing theory, approaches the market from a new direction and offers investors a new way to invest. Seeks to give students greater personal confidence about the stock market and a better understanding of the market’s underpinnings. Students read Chipping: How to Survive Market Turbulence and Hit a Hole-in-One and are assigned the task of developing an investment portfolio in the first ten trading days after the first week’s class session.

BUSN 6228. Residential Real Estate Analysis. 1 Hour.
Designed to focus on residential real estate investing, especially as a homeowner. In the last decade, the residential real estate market has been the best investment for individual investors. In the Greater Boston metropolitan area, the return on housing has significantly outpaced the national average that brought the median sale price of single-family homes to $415,800 by the third quarter of 2002. Investments made in a personal residential property easily become the largest investment for a household; therefore, investors should understand the process and valuation of residential real estate investing. Introduces the analytical process of investing in the housing market, including the analysis of current market conditions, mortgage financing, and valuation. Offers students a hands-on experience of investing through a simulated investment project.

BUSN 6229. Intellectual Board Games and Business Strategy. 1 Hour.
Takes two of the best and most-played intellectual board games, chess and Go, and exposes the student to a study of the relationship between intellectual games and business strategy. Using games as a metaphor to study business behavior and business strategy is quite common, though typically done at a superficial level. Provides students with the opportunity to learn how to play Go; to understand its strategic and tactical thinking; and to compare chess, Go, and business strategy. Studies Microsoft’s tactics and strategy as viewed from tactical and strategic principles learned from the games.

BUSN 6230. Evolution of the Internet as a Marketing Medium. 1 Hour.
Discusses current issues in electronic marketing/ e-business. Explores recent trends such as continuing e-business and Internet marketing activities beyond the bursting of the dot-com bubble. Examines how firms currently use the Internet to improve marketing strategy and enhance customer relationships. Investigates the role of trust in Internet marketing strategies and identifies factors that influence customer perceptions of trust. Presents ways in which trust can be built in e-business relationships with customers and business partners.

BUSN 6231. Issues in Corporate Governance. 1,1.5 Hour.
Examines conflicts over control and governance of the corporation from a finance perspective. These conflicts often precipitate dissident shareholder actions such as proxy fights, hostile takeover attempts, and securities litigation, each of which are key concerns of top-level managers. Because stock market prices are critical to understanding virtually all conflicts regarding corporate control, part of this course covers efficient market theory and the assumptions that underlie it. The final part of the course focuses on using principles developed in the first part to analyze issues surrounding actual proxy fights, court cases, hostile takeovers, and current public policy debates. Includes specific issues of current interest: poison pills, dead hand provisions, executive salaries, and binding proxy votes.

BUSN 6232. Business Environment of Latin America. 1 Hour.
Focuses on a variety of important managerial issues in Latin America. Familiarizes students with economic, cultural, and political issues that are somewhat unique to the countries that comprise Latin America. Emphasizes international strategic maneuvering within Latin America. Geared toward the development of a more in-depth understanding of the issues that international managers face when expanding operations into this part of the world. Specific topics include economic development; cultural and historical perspectives of select countries (probably Chile, Ecuador, and Honduras); corruption patterns; strategies for entering certain markets; the political/legal dimension; and language/dialect differences.
BUSN 6233. Doing Business in Russia. 1 Hour.
Traces the evolution of Russia's business conditions from the economic reforms introduced by President Gorbachev in the mid-1980s to those currently being implemented by President Putin. The Russian business landscape underwent dramatic changes during the country's transition from a centrally planned to a market-oriented economy. The decade of wild capitalism is over and President Putin's top priorities are economic growth, investment, and entry into the World Trade Organization. Emphasizes the current economic and business environment, including reforms and legislation in taxation, corporate governance, and investment opportunities. Draws course materials primarily from publications on Russian management, including case studies of U.S. and Russian companies, empirical studies of the business environment and managerial decision making, and analyses of the progress in corporate governance and protection of shareholders' rights.

BUSN 6234. Diagnosing and Resolving Conflicts. 1 Hour.
Focuses on understanding the nature of conflict, mostly interpersonal conflict, and provides practice in dealing with conflict situations. Conflict is an inevitable, ubiquitous, and necessary part of organizational life, but there is also much evidence that conflict often produces harmful results. This one-credit course seeks to give students the skills to make sure conflict results in a positive outcome. Given the current business trends toward workforce diversity, globalization, and flatter decentralized organizations, how managers form different organizations and how cultures deal with conflict are increasing predictors of organizational success.

BUSN 6235. Retailing in the New Millennium. 1 Hour.
Uses a one-day crash course format to look at the current state of affairs to understand what is happening in retailing today. Analyzes why some of the age-old leaders are failing, which retailers are succeeding and why, and the impact (or lack thereof) of e-retailing on the industry—and, more important, the lessons e-retailing have taught us. Seeks to give students a clearer and deeper understanding of what it takes to succeed in retailing today and why so many historical retailers seem unable to make the transition. Focuses on marketing orientation and positioning in the marketplace, as opposed to a traditional retail operations focus. Students apply these concepts to a separate retailer, critically assessing this retailer's performance and future potential.

BUSN 6236. Project Management. 1 Hour.
Explores the challenges associated with planning, organizing, operating, and controlling in a project environment. Projects are unique, onetime occurrences and, as such, require different managerial perspectives. Examines skills and techniques essential to project management. Combines class discussion with hands-on work in the computer lab.

BUSN 6237. Open Source Business. 1 Hour.
Focuses on the managerial aspects of open source software, rather than on the technical aspects. Open source software is also known as free software. The course title presents the paradox central to this course. For-profit firms invest in open source software, which is by its very nature available at no charge. (Indeed, many prefer that the software be described as “free” rather than as “open source.”) Why do firms such as IBM and Red Hat make these investments? Related to the managerial issue of profitability are issues such as intellectual property, human motivation, and freedom itself.

BUSN 6238. New Venture Finance. 1 Hour.
Describes how to present a credible story to potential financiers, the practices used to judge the financiability of a venture, the characteristics of successful deals, and the potential sources of funding. Finding money to launch a new venture without giving away too large an interest is a daunting task for the entrepreneur. This is particularly true in today's economy. Yet even in times such as these, there are a variety of ways to secure the funds necessary to undertake a new venture. Involves readings and case discussion. Angel financiers and venture capitalists may join the discussion, providing participants with an opportunity to interact with those who make funding decisions.

BUSN 6239. Strategic Human Resources Management. 1 Hour.
Focuses on the strategic side (as opposed to the administrative side) of human resource management. Covers some basic principles of selection, training, and compensation and illustrates some “best-practices” companies that use HRM for competitive advantage.

BUSN 6240. Systems Thinking in Business. 1 Hour.
Looks at the business environment from a systems approach where all market components are closely linked but also coevolving. Today's business managers face a world that is more dynamic and more uncertain than ever before. Utilizes the “Beer Game,” a management flight simulator that focuses on the dynamics of the supply chain and the managerial decisions that affect the overall supplier-manufacturer-customer relationship, so that managers may experience the long-term consequences of their actions. Also focuses on complexity theory based on the recent explorations in adaptive and emergent systems as an offshoot of chaos theory. Covers the effects of social networks on the marketplace, the concept of increasing returns (as opposed to diminishing returns), and the role of network externalities in the diffusion of new products.

BUSN 6241. Manager as Mediator. 1 Hour.
Covers the role of the mediator, basic steps and principles of mediation, dealing with difficult emotional conflicts that arise in mediation, and ethical dilemmas in mediation. Increasingly, organizations are trying to resolve difficult conflicts through mediation and are asking managers to develop their mediation skills. Conflicts are common in today's organizations, especially with various "rights" being supported by both the courts and other kinds of pressure. Organizations are also becoming flatter, which adds to the potential for conflict as hierarchy decreases in importance. The costs of unresolved conflicts can be immense in terms of loss of organizational and individual effectiveness, dysfunctional behavior, and costly and painful litigation.

BUSN 6242. Great Companies. 1 Hour.
Reviews what the experts have said about what it takes to be considered a great company and what enables a company to achieve this greatness. Analyzes, through case studies, a few highly admired (great) companies. Students study how they do it, i.e., what organizational practices seem to account for their success. Gives students the opportunity to clarify their view of what defines and makes a great company and to increase their knowledge of the principles and practices of some great companies.

BUSN 6243. Nonprofit Financial Management. 1 Hour.
Focuses on the similarities and differences between traditional businesses and not-for-profit entities. Covers restricted funds, accounting for grants and pledges, application of time-value-of-money discounts to “long-term” current assets, budgeting, specialized financial reporting for contracts and grants, and specialized financial reporting for state and federal oversight, such as the Uniform Financial Report in Massachusetts.
BUSN 6244. Advanced Strategic Sourcing. 1 Hour.
Provides students with the opportunity to learn quick and easy ways to negotiate effective supply agreements and how to reduce the total cost of their supply chains. Effective strategic sourcing agreements help businesses manage their supply chains and also involves selecting the sources of supply aligned to corporate strategies and marketing requirements. This course explores how strategic alliances can be excellent ways to outsource activities that are not core competencies to the firm. Offers students the opportunity to learn how to manage a supply base strategically and how to select quality suppliers for their supply chain.

BUSN 6245. Globalization: Threats and Opportunities. 1 Hour.
Designed to help students understand the complex forces shaping the emerging global business environment. The rapid globalization of markets and production is transforming business, creating new market opportunities and new threats. But, as the impact of globalization spreads throughout regions, countries, and industries, a backlash is growing in the form of protests, protectionism, and criticism of multinational business. Will globalization deepen the divide between winners and losers, or will it result in greater benefits to all? How should these globalization processes be regulated or governed? The course explores the function and future of governance institutions such as the World Trade Organization and the International Monetary Fund, various attempts at regulating foreign direct investment and international capital flows, and controversies over foreign outsourcing. Also explores criticisms of globalization.

BUSN 6246. Financial Analysis and Modeling with Excel. 1 Hour.
Combines financial topics and financial analysis methods with basic and intermediate-level Excel tools. Taught in the computer lab, this is a hands-on course. A basic understanding of Excel’s features plus previous course work in accounting and finance are highly recommended due to the intensive nature of the course.

BUSN 6247. Effective Leadership Skills. 1 Hour.
Offers students the opportunity to learn practical and proven techniques for influencing people and creating personal power. Leadership skills are key to career advancement in business. Analyzes how charismatic leaders create their influence and power, the guidelines for successfully transforming organizations, and the characteristics of truly effective leadership. Covers ten specific techniques to improve students’ competence as leaders.

BUSN 6248. Greening the Global Economy with Sustainable Business. 1 Hour.
Exposes students to the responsibilities of business to the natural environment in a globalizing economy. Challenges students to consider if it’s possible for companies to be both ecologically responsible and globally competitive, how managers should respond to pressure from activists and governments to become more environmentally responsible, and how “industrial ecological” concepts can be incorporated into business practices. Ecologically responsive and responsible management is emerging as one of the most significant business challenges of the twenty-first century.

BUSN 6249. Expanding the Panama Canal. 1 Hour.
Designed for students with an interest in finance, economics, and supply chain management who wish to learn about one of the wonders of the modern world—the Panama Canal. Built in the early 1900s by President Theodore Roosevelt, the Panama Canal was an engineering marvel. It opened up major trade routes between countries that border on the Pacific and Atlantic oceans. The canal put some transportation out of business; now new modes are competing with the canal. As world trade continues to grow, the canal is considering expanding at a cost of $10 billion to handle larger ships. The course focuses on the history/background of the canal, the world trade outlook and impact on the Panama Canal, and the economic benefits and costs of expansion.

BUSN 6250. Comprehensive Industry Analysis: Medical Devices Industry. 1 Hour.
Provides a comprehensive industry analysis of the medical device industry. Examines the interaction and interdependence of business functions to obtain a comprehensive view of the operations of one or more companies within this growing industry. Using a basic business-planning outline, students explore the focus of the medical devices industry (the problem), the products and services offered within the industry (the solution to the problem), the market, and the companies that serve the market. Gives students the opportunity to see how the five major business disciplines (sales/marketing, operations, finance, development, and human resources) function within the industry. Sales/industry trade association representatives and company representatives appear as guest speakers.

BUSN 6251. The Dynamics of Pricing. 1 Hour.
Designed to teach the strategy and tactics of pricing. There are many business courses that teach about managing innovation, lean manufacturing, finance and accounting, and advertising and promotion. Yet, if firms fail to price their products and services properly, the consequences to their profitability are severe. This course explores why pricing is often ineffective and presents the discipline of strategic pricing. Examines how costs affect pricing decisions and how to price for profit. Analyzes the impact of pricing decisions on customers and the competition.

BUSN 6252. International Management: Insights from Fiction. 1 Hour.
Combines two approaches to help students develop skills in cross-cultural management—short stories from around the world paired with readings in international management. The stories and readings are drawn from Professor Puffer’s 2004 book, International Management: Insights from Fiction and Practice. Doing business internationally requires a broad set of managerial skills and a clear understanding of other cultures. Covers culture shock, repatriation, the meaning of work and personal values, power and authority, and building an international team. Uses management readings as an analytical framework in which to discuss the stories.

BUSN 6253. Fraud and Society: The Law and the Reality. 1 Hour.
Provides an overview of basic fraud theory, the U.S. legal system, and the law related to fraud. Fraudulent behavior is not unique to business enterprises. Studies and statistics support the fact that anyone is a potential victim of a variety of fraud schemes. No one is held harmless. Consumer-related fraud includes some of the most costly “crimes” facing individuals and society. Examines the methodology of the most common fraud schemes.
BUSN 6254. Strategy for Not-for-Profits. 1 Hour.
Designed to serve as a primer on how not-for-profit organizations operate. There are more than 1.8 million not-for-profit organizations in the United States employing 6.6 million individuals. These organizations produce a tremendous amount of revenue and come in many forms, representing diverse interests. It is important to know how they operate, since students entering the business world may interact with these organizations in a number of important ways. The interaction may be as employees, as members of the board of directors, as gift givers, and as members.

BUSN 6255. Contemporary Management of Risk in Projects. 1 Hour.
Teaches students how to assess and manage risk in projects. Provides students with the opportunity to learn to become aware of risk, to understand how risk affects human behavior, to develop a risk-management plan, to use quantitative analysis to manage risk, and to understand how to make decisions in the face of uncertainty.

BUSN 6256. Social Entrepreneurship. 1 Hour.
Examines the growing area of social entrepreneurship, or the process of creating and managing new nonprofit ventures focused on improving social conditions, especially among the world's most needy population. Many estimate that the fastest-growing employment sector around the world is the nonprofit and nongovernment sector, comprised of organizations that are organized to solve social problems that governments and the for-profit sector have failed to address, or ignore. In addition to case discussions, students create a microlending enterprise to address an unmet social need outside the United States. Based on the merits of the proposal, funding is sought in follow-up to the course.

BUSN 6257. High-Commitment Organizations. 1 Hour.
Explores how organizations can be designed and run to create conditions of high commitment—and high performance. Most people would rather work and invest in organizations where employees care about what happens; i.e., they act more like owners and less like hired hands. Organizations show great variation in the extent to which they achieve this high commitment. The difference stems from the choices—e.g., in purpose, culture, rewards, structure—that companies make. Gives students the opportunity to experience the contrasting impacts of low- and high-commitment organizations, to understand the organizational factors that affect commitment, and to learn the organizational design choices that lead to high commitment.

BUSN 6258. Europe in the Global Economy. 1 Hour.
Introduces the institutions, policies, and competitive practices of the European Union (EU) in the wider context of the global economy, emphasizing the Euro crisis and its global impact. The EU is now the largest and wealthiest single market in the world. As such, the structure and dynamics of the EU present significant challenges and opportunities for global managers, who must understand its different governance and regulatory, competitive, and cultural systems. The crisis in the common currency has far-reaching implications, not just for the EU but for the entire global economy. Covers the European business context in an instructive contrast to the “American model” of capitalism.

BUSN 6259. East Asia, Globalization, and the New Economy. 1 Hour.
Develops an overview of the East Asian business scene: how it got there, where it is today, and where it is likely to go in the future. Explores the business opportunities that are being created in this part of the world. Topics include what kind of businesses (or business linkages for U.S. firms) are appropriate to East Asian countries, which countries are most suitable for each kind of business, how the trend to offshoring impacts East Asia (and possibly its competition with India), and what the requirements and barriers are for building businesses related to the East Asian scene.

BUSN 6260. Blogging and Business. 1 Hour.
Covers blogging and business. Weblogs, or blogs, are identified by Harvard Business Review as one of the “breakthrough ideas for 2005.” Blogs have been prominent in many other mainstream media sources, and blogging has business potential in many senses because it is a channel through which firms can communicate with stakeholders. Firms that do so include Microsoft, Boeing, Stonyfield Farm, and many others. Reviews the business issues around the use of blogs. Gives students the opportunity to start their own blogs.

BUSN 6261. Global Sourcing. 1 Hour.
Provides students with an opportunity to learn quick and easy ways to identify and locate the best source of supply on a global basis. More and more companies are sourcing globally, with some companies outsourcing an entire portion of their operations. Global sourcing also involves selecting the sources of supply aligned to international corporate strategies and marketing requirements. Explores how strategic alliances can be excellent ways to outsource activities that are not core competencies to the firm. Focuses on how to manage a supply base strategically and how to select quality suppliers for a supply chain.

BUSN 6262. Business Lies, and the Big Fat Liars Who Tell Them: Setting Your Ethical Compass. 1 Hour.
Offers students an opportunity to gain a greater appreciation for the pressure and stress around corporate and individual performance in growing companies, especially public ones, and how that pressure can often lead otherwise virtuous people to pursue paths that often lead to their demise.

BUSN 6263. Working Capital Management. 1 Hour.
Highlights the critical areas in the management of the “current” portion of the balance sheet, Current Assets and Current Liabilities. Includes discussion of cash balances and cash flows, accounts receivable and credit management, inventory management, accounts payable and vendor relations, short-term financing, and cash conversion cycles in today’s market environment.

BUSN 6264. Real Life of Consumers: Qualitative Marketing Research. 1 Hour.
Introduces students to qualitative research. Includes how to distinguish it from quantitative research; an overview of the social science fundamentals of qualitative research, predominantly from anthropology and sociology; and examples of key qualitative data collection methods. Gives students the opportunity to learn to conduct qualitative interviews and observations as the basis of qualitative data analysis.

BUSN 6265. Brand in the Hand: An Introduction to Mobile Marketing. 1 Hour.
Examines how the mobile platform is evolving into an innovative medium for marketing activities. Provides students with an opportunity to investigate how firms are currently using mobile devices for marketing. Presents examples of innovative “Brand in the Hand” marketing in the United States and in the global arena and compares consumer response to mobile marketing established in emerging markets.

BUSN 6266. Negotiations: Developing Your Negotiation Skills. 1 Hour.
Covers the basic elements of negotiations. Uses short lectures, role-playing, and simulations to provide a number of situations for students to develop their skills.

Examines contemporary issues in the science and politics of U.S. energy. Begins by reviewing scientific findings on energy use and environmental impacts. Discusses how key stakeholders are reacting to emerging concerns about peak oil, environmental pollution, and global warming.
BUSN 6268. Varieties of Global Capitalism. 1 Hour.
Designed to acquaint students with several distinctive varieties of market-based institutions and the business-government relationships they support. Examines the Nordic style of welfare capitalism; the German style of corporatism; the worker-manager codetermination of the Japanese style of tight cooperation between the "Iron Triangle" of business, finance, and government; and the Indian and Chinese models, which are transforming from heavy state control to a mixed economy.

BUSN 6269. Information Quality for Global Managers. 1 Hour.
Discusses how information quality is defined, measured, analyzed, and improved through the lenses of various areas such as management information systems, philosophy, and organizational learning. Exposes students to different perspectives from different disciplinary areas and how they are used to frame and solve information quality problems differently in the entire information production process. Also introduces students to state-of-the-art assessment and measurement concepts, techniques, and tools.

BUSN 6270. Management Skills Development Seminar. 1 Hour.
Offers students the opportunity to assess their individual management skills and to initiate actions toward building management skills to a higher level of competence. Provides students with the opportunity to undertake a 360-degree skill-assessment process that will lead to the crafting of personal development plans. Enables students, over the course of the term, to implement these plans. Uses learning teams to provide mutual support to the student in management skills assessment and analysis, developmental planning, and tracking progress against actions and accomplishments.

BUSN 6271. Decision Making and Its Impact on Organizations. 1 Hour.
Combines a historical look back at decisions that changed the business world irrevocably with current topical decisions that are impacting the international business world today. Offers students an opportunity to explore how decisions are made, the structural and interpersonal issues that either impede or support effective decision making, and the steps organizations must take to overcome the challenges created by ineffective decisions.

BUSN 6272. Mastering Business Intelligence to Manage Global Business Organizations. 1 Hour.
Explores the role of business intelligence (BI) processes within the enterprise, how they work, their associated costs, and their implications for business success. Exposes students to the decision-making process that is grounded in the data generated by the enterprise as supplemented by intelligence drawn from competitors and the marketplace as a whole.

BUSN 6273. Sustainability in Innovation. 1 Hour.
Focuses on different types of strategies firms have taken for sustainable innovation. Introduces the concept of designing products for the triple bottom line—people, planet, profit. Offers students an opportunity to design product ideas and formalize corporate strategy for sustainable innovations. Working in teams, students present the product ideas in class.

BUSN 6274. Social Media Marketing. 1 Hour.
Examines social media marketing (SMM) strategies across business-to-business (B2B) and business-to-consumer (B2C) environments from both the company as well as the consumer perspective. Discusses the elements of online social media "ecosystems," successful SMM strategies from both large and small companies, the importance of integrating SMM with other forms of marketing communications, and ways to measure results and return on SMM.

BUSN 6275. Ethical Issues in the BRICs. 1 Hour.
Focuses on corruption, bribes, and favors in the BRIC countries of Brazil, Russia, India, and China. Topics include the scope and nature of these ethical issues, how they affect doing business in those countries, and how Western firms handle these issues while abiding by the U.S. Foreign Corrupt Practices Act and international standards of business conduct.

BUSN 6277. Mastering the Art of Public Speaking. 1 Hour.
Studies the characteristics of effective presentations. Exposes students to the mechanics of planning, preparing, and practicing presentations. Introduces students to a variety of public-speaking scenarios and specific formats for particular situations. Offers students an opportunity to practice giving presentations, which will be video-recorded for feedback and coaching purposes.

BUSN 6278. National Strategies in the Global Economy. 1.5 Hour.
Employs a comparative model for understanding how nations position themselves to compete effectively. Exposes students to various frameworks for analyzing national competitiveness and country risk, primarily in emerging markets. Uses in-depth country case studies to compare the policies and strategies of a range of nations at different levels of economic development and to consider the implications for business responses to these challenges and opportunities.

BUSN 6280. How Executives Shape and Lead Innovation and Enterprise Growth. 3 Hours.
Focuses on different types of innovation (technical, market, business model, and organizational), the role of executive leadership, and enterprise growth in technology-intensive industries. Offers students an opportunity to apply a strategic management framework to industry leaders through case studies. Students are then asked to apply the framework to the future growth of their own organizations and the career path they seek in that growth. Seeks to help students successfully begin the excursion through the High Tech MBA program.

BUSN 6281. Venturing with Northeastern Entrepreneurs, Investors, and Corporate Executives. 3 Hours.
Offers an intensive residency that brings together Northeastern alumni/ae and/or current students who are entrepreneurs, investors, or corporate executives and who have successfully delivered disruptive innovations across multiple industry sectors. Introduces students to entrepreneurship concepts for both the startup and corporate context. Working in industry teams, students have an opportunity to identify new product, service, and business-model innovation opportunities and explore startup and corporate pathways to develop and market these opportunities.

BUSN 6282. Integration Residency. 0 Hours.
Focuses on business planning, strategy, negotiations, and communications for new venture proposals. During this short, intensive residency, students present and defend their business plans developed in MGMT 6281. Involves presentation and evaluation of each group's plan by other groups. Judging groups allocate "funds" to deserving proposals.

BUSN 6283. Defending and Evaluating Business Plans. 6 Hours.
Follows up BUSN 6281, in which business plan ideas were developed, and MGMT 6281, in which written business plans were developed by teams. This course involves teams defending their business plans and also evaluating business plans of other teams, as they compete for limited theoretical funding for their projects.

BUSN 6284. Managing Change from Where You Sit. 1 Hour.
Focuses on supervisors and managers and how to motivate employees to alter their patterns of behavior. Offers students an opportunity to acquire the conceptual and behavioral tools necessary to help manage the required changes from all levels of the organization.
BUSN 6294. Early Stage Intellectual Property Decisions. 1 Hour.
Introduces the different functionality and potential value of four types of intellectual property (IP) assets (utility patents, copyrights, trademarks, and trade secrets) and IP strategies, with a focus on new ventures. Early stage decisions about IP have a direct impact on costs, funding, development, and competitive position. Covers which type of IP best matches the venture’s development and launch objectives; how IP asset development can support (or undermine) the business plan; what priorities influence early stage decisions; when a trade secret strategy is more effective than patents; and how IP assets can help a startup to bridge the “valley of death.” Offers students an opportunity to evaluate and prioritize potentially available IP assets and develop an early stage IP plan for a new venture.

BUSN 6302. Talent Management. 1 Hour.
Addresses all components of talent management with a particular emphasis on motivating and developing employees. Companies are realizing that the way in which they manage their talent—in other words, their effectiveness in attracting, selecting, developing, motivating, and retaining their talent—is key to organizational effectiveness. Discusses some of the fundamental choices that companies face in each area and explores some of the companies with the best talent management systems. Uses lecture, discussion, and case discussion, supported by videos, as the primary format.

BUSN 6303. Global Managers—Legal and Ethical Challenges. 1 Hour.
Focuses on recent international conventions and national laws, with reach beyond domestic borders, that are changing the legal and normative environment in which domestic and global business is conducted. Concentrates on managerial behavior in global business organizations. Introduces students to different forms of corruption in developed and emerging markets, discusses their effects on society, and introduces the most relevant international legal standards and sanctions. Uses case studies and recent legal cases to highlight the business risks and consequences of noncompliance on individuals and organizations.

BUSN 6304. Career Management for Working Professionals. 1 Hour.
Seeks to provide working professional students with the tools and strategies they need to advance their careers. Job search techniques are critical skills, and this course addresses key tools needed to support job searches: résumés, cover letters, networking profiles, etc. Offers students an opportunity to learn about successful networking, job search strategy, and interviewing. Includes interactive exercises and individual feedback.

BUSN 6305. Social Media Has Changed Marketing. 1 Hour.
Focuses on social media and how they are being used in business. Uses case studies of various companies to explore how they are using social media. Introduces students to a repeatable social-media methodology and exposes them to a variety of social-media platforms, which may include Facebook, LinkedIn, Twitter, Pinterest, and others.

BUSN 6306. Creativity Skills for Leadership. 1 Hour.
Addresses the nature of creativity and covers several popular creativity techniques. Topics may include the definition of creativity, myths and theories of creativity, popular creativity techniques, and their application. Offers students an opportunity to obtain an understanding and insight into their own creativity and to assess and evaluate their creativity as well as that of others.

BUSN 6307. Strategy and Technological Change. 1 Hour.
Introduces students to “disruptive technology” and how it differs from a “sustaining technology.” Analyzes why accepted principles of good management are inappropriate in the face of disruptive technologies. Examines why firms struggle in adapting to these technologies, even after they recognize and attempt to incorporate these changes, and how firms can learn to manage disruptive innovation.
BUSN 6308. Mobile Marketing Research. 1 Hour.
Explores the why, when, and how of conducting mobile marketing research by introducing a variety of qualitative and quantitative mobile methods. Given the increase in social media and mobile technologies, companies are beginning to embrace mobile platforms to conduct marketing research. Seeks to identify the evolving best practices of mobile marketing research by utilizing current literature, discussing a mobile survey research case, and developing a mobile research proposal. Examines ethical guidelines from associations’ codes of ethics and applies them to the course work.

BUSN 6309. The Reality of the Merger and Acquisition Process: What to Expect. 1 Hour.
Introduces the mergers and acquisitions (M&As) process and a variety of aspects of M&A, including identification of objectives, hidden agendas, cultural differences, organization, business model, and communications. Offers students an opportunity to learn the various components involved in a merger and what a merger might represent for both parties, the one overtaking and the one being acquired. Examines traditional and academic strategic frameworks and how they work in actual M&A processes.

BUSN 6310. Strategic Human Resources Practices for Managers. 1 Hour.
Focuses on three core management responsibilities where human resources (HR) skills are critical: implementing organizational change, challenges and opportunities of performance management, and developing and retaining key contributors. Targeted toward managers in all parts of an organization and offers them an opportunity to enhance their critical HR skills and practices in managing their organizations.

BUSN 6311. Financial Statement Analysis. 1 Hour.
Covers financial reporting, financial statement analysis, and the three major approaches to business (entity) valuation. Reviews the components of the financial statements and primary Securities and Exchange Commission (SEC) filings and evaluates how to assess the quality of information in those statements. Exposes students to approaches used to leverage the information provided to evaluate company strategies and competitive and risk profiles and to engage in entity-level valuation. Also includes an overview of issues and approaches related to intangible asset valuation.

BUSN 6312. Competing in and with China and India. 1 Hour.
Explores the implications of the global economic shift toward emerging economies. Covers frameworks to understand why some U.S. firms have reworked their global strategies more effectivley than others. May also address challenges in gaining market share, serving base-of-the-pyramid customers, offshoring the value chain, and tapping into the innovation potential of these locations. Offers students an opportunity to explore implications for personal career development in an effort to help them better prepare for the different world ahead.

BUSN 6313. Issues in Franchising. 1 Hour.
Covers key issues that are relevant to the development, management, and operation of franchise businesses from the perspective of both a franchisor and franchisee. Discusses topics that relate to franchising, including the history of franchising and its growth and importance to industry and the economy as well as key topics that relate to franchisees and franchisors.

BUSN 6314. Practicing “Leaderful” Development in Organizations and Networks. 1 Hour.
Designed to give students some practical background and experience in engaging in leaderful development in an organization or network. Covers the background of standard leadership development and how its practice has shifted in recent years from “leader development” to “leadership development.” Exposes students to the prospective shift from “leadership development” to “leaderful development,” acknowledging that leadership can be available not only to everyone in the organization but can arise as a collective social interaction. Students should have access to a place of work or a volunteer or community organization requiring interaction with others.

BUSN 6315. How Credit and Liquidity Precipitate a Financial Crisis. 1 Hour.
Asks students to conduct an intensive, focused review of up to five transformative financial events in the modern era of American history. These events—such as the 1913 creation of the Federal Reserve System in the aftermath of the 1907 financial panic and banking crisis—are used to illustrate and explain key factors and attributes of the financial system, its institutions, and the responses of private and government decision makers to financial crises. The development of analytical frameworks for students to organize and analyze information about recent financial events is a central theme of the course.

BUSN 6316. The Role of Multinational Natural-Resource Companies in the Global Economy. 1 Hour.
Examines various issues regarding the role of multinational natural-resource companies (MNCs) from a stakeholder perspective, including MNCs, workers, governments, suppliers, customers, and the natural environment. Many students may work in various business functions in sectors dependent upon natural resources (e.g., electronic device manufacturing, auto manufacturing, investments), and this course is designed to expose them to, and may create an understanding of, the key role played by MNCs.

BUSN 6317. Global Sourcing of Information Management Personnel and Services. 1 Hour.
Exposes students to the various options available today in sourcing information technology services, call center and backroom processing operations, and technical staffing. In considering each of these options, students are asked to consider their operational, managerial, and cost implications. Then, as a field exercise, students are asked to explore and analyze sourcing options within their own organizations and to reflect upon the benefits and risks associated with these choices.

BUSN 6318. The Team Clinic. 1 Hour.
Presents the fundamentals of teams and team skills through cases and articles. Emphasizes, through exercises and role-plays, the “how-tos” of teams. Offers students an opportunity to practice giving and receiving feedback, setting goals, agreeing on team norms, managing teams as teams, and other essential components of effective teams.

BUSN 6319. Power and Politics: Getting Things Done in Organizations. 1 Hour.
Addresses two interrelated forms of politics: (1) organizational—focused on achieving business goals—and (2) office politics—focused on achieving individual career goals. Offers students an opportunity to learn concrete ideas and strategies for enhancing their ability to achieve their organization’s business objectives while also advancing their own personal career aspirations.
BUSN 6320. Business Analytics Fundamentals. 1 Hour.
Introduces the key concepts of data science and data analytics as applied to solving data-centered business problems. Emphasizes principles and methods covering the process from envisioning the problem; applying data science techniques; deploying results; and improving financial performance, strategic management, and operational efficiency. Includes an introduction to data-analytic thinking, application of data science solutions to business problems, and some fundamental data science tools for data analysis.

BUSN 6321. Just Because We Can Doesn't Mean We Should: Why Some Smart Products Are Dumb Ideas. 1 Hour.
Examines the trend of smart products. Discusses and reviews the pros and cons of both technology-led and human-centered innovation while examining the need to borrow from both perspectives to create a successful innovation. A major component of the course is to discover, discuss, and dissect examples of smart products found on crowd-funded websites to help illustrate the importance of having both technology-led and consumer-led elements when creating a new idea.

BUSN 6322. U.S. Healthcare Reform—Past, Present, and Future. 1 Hour.
Focuses on the current state of healthcare reform in the United States, with an examination of the historical factors that led to the current legislation. Analyzes evolving issues around implementation; state responses; provider, payer, and employer strategies; and the impact on employees, as well as possible unintended consequences. Evaluates the impact on the Triple Aim initiative (cost, quality, and access).

BUSN 6324. Predictive Analytics for Managers. 1 Hour.
Presents the concepts of correlation and simple linear regression analysis as well as multiple regression analysis. Offers students an opportunity to build multiple regression models and use them in forecasting and analyzing data. Exposes students to nonlinear regression models, reading and analyzing output tables, and using statistical software tools.

BUSN 6325. The Moral and Social Dimensions of Business Leadership and Decision Making. 1 Hour.
Offers students a different context in which to examine the ideas of corporate social responsibility and business ethics. Course objectives include understanding how strategic business decisions are made within public and private governance structures, considering the impact of growing wealth and income inequality, and evaluating alternative decision-making models that elevate moral ideals. Examines morally courageous business and civic leaders and their hallmark decisions in order to consider the challenges and opportunities in transferring best practices from the civic arena to the business sector.

BUSN 6326. Introduction to Big Data and Digital Marketing Analytics. 1 Hour.
Introduces the emerging phenomenon of big data and digital marketing analytics. Offers students an opportunity to learn how marketing analytics on big data can help in understanding customer behavior and in creating digital marketing strategy. Examines how marketers are collecting and using big data and applying marketing analytics tools on new media, such as social networks, and on new devices, such as mobile phones, to create successful digital marketing strategies. Examines current trends and issues that firms face in implementing marketing analytics on big data. Presents examples of best practices in digital marketing analytics, and explores how consumers and marketers can benefit from big data. Also examines consumer privacy issues that arise in big data analytics.

BUSN 6327. Managing and Working in a Virtual World. 1 Hour.
Introduces students to the significant base of knowledge that already exists about the effects of virtuality on work. Presents a framework of virtual work skills that, while solidly grounded in academic research, are delivered using a practical, experiential approach. The framework includes two categories: individual work skills for all virtual workers and managerial skills and processes for those who are managing/leading virtual workers.

BUSN 6328. How Macroeconomic Events Will Shape the Supply Chain of the Future. 1 Hour.
Explores how some of the unprecedented macroeconomic events currently roiling global markets will reshape the supply chain of the future. Offers students an opportunity to study the impact of past macroeconomic events and to learn to project how today’s events are likely to change the way global business is conducted in the future. Events include the decline of oil prices, depreciation of the euro and yen, zero/negative interest rates, the eventual return of interest rates to historical norms, demographic shifts in both the developed world as well as China, rising consumer delivery expectations driven by Amazon Prime, and the crumbling U.S. infrastructure/transportation gridlock.

BUSN 6330. Innovation, Product Line Strategy, and Product Platforms. 1 Hour.
Reviews innovation theory and methods, including customer segmentation, user-centered design, and platform innovation. Explores the application of these frameworks to next-generation products, systems, and services.

BUSN 6331. Rapid Design and Development. 1 Hour.
Examines the trend of smart products. Discusses and reviews the pros and cons of both technology-led and human-centered innovation while examining the need to borrow from both perspectives to create a successful innovation. A major component of the course is to discover, discuss, and dissect examples of smart products found on crowd-funded websites to help illustrate the importance of having both technology-led and consumer-led elements when creating a new idea.

BUSN 6332. Agile Finance. 1 Hour.
Exposes participants to basic financial intelligence in a context of defining a business model for innovation projects. Emphasizes revenue modeling and resource planning. Introduces different types of business models for product, software/systems, and services and the distinguishing factors of each. Seeks to provide participants with skills to develop financial projections and accompanying financial statements for innovation initiatives.

BUSN 6333. Lean Business Model Design for New Ventures. 1 Hour.
Studies the contemporary “lean” (i.e., experimental, non-commitment) approaches to designing viable business models for high-growth new ventures. The theoretical part of the course covers the introductory topics in the modern understanding of business models: their essence and role in securing competitive advantage, key components and design of business models, technology commercialization through sustaining business models, and key approaches for business model validation. The practical part of the course allows students to apply the acquired theoretical knowledge to the cases of designing and validating the business models of new ventures.
BUSN 6334. Social Media Marketing: Principles and Strategies. 1 Hour.
Examines the most important issues facing marketers today in relation to the changing media landscape and the rise of social media. Social media gives customers a voice, connects them to each other as well as companies, and crosses geographical boundaries. Focuses on understanding this context and how to leverage it for strategic business and marketing gains. Through a combination of lectures, case discussions, team and individual exercises, and a mini-project on social media evaluation, the course covers main principles and strategies related to social media on how and where social media can add value and provide opportunities to engage and manage customers.

BUSN 6335. Promoting Sustainable Practices at Work. 1 Hour.
Studies climate change and the depletion and degradation of the earth’s resources. Analyzes the scope of the issues and explores how companies are responding in the workplace and with their suppliers and customers. Discusses the economic, technological, political, social, psychological, and moral/ethical dimensions as well as solutions. Offers students an opportunity to utilize tools for being the change within their workplace as well as participate in online case discussions of companies engaging in sustainability best practices. Includes exposure to two dozen Australian organizations engaged in exemplary sustainability practices and to guest speakers who are experts in climate change, carbon dioxide, and water sustainability.

BUSN 6336. Data Mining for Managers. 1 Hour.
Offers students an opportunity to appreciate and to be able to identify the enormous opportunities that currently exist in providing business intelligence services based on data mining techniques of data capture, cleansing, validation, storage, and analysis. Emphasizes real-life applications, with an intuitive approach of discussing the concepts behind the various data mining techniques covered, which may include principal components analysis (PCA), market basket analysis (MBA), and discriminant analysis (DA). Requires prior course in statistics.

Investigates ethical theory and decision making in practice, including blind spots that cause many managers to believe they are ethical when their decisions contradict their beliefs. Publicly traded companies are required to comply with Securities and Exchange Commission (SEC) regulations. The formal requirements are imperative for efficient capital markets. However, the informal tone at the top establishes the culture that is necessary for compliance and ethical decisions. Explores the legal ramifications for noncompliance and individual ethical decision making to mitigate the risk of noncompliance.

BUSN 6338. Blockchain and Bitcoin—Radical Innovation and Strategic Response. 1 Hour.
Introduces blockchains and their impact on a wide variety of industries, including finance, healthcare, commodities trading, supply chain and logistics, and foreign currency markets. Banks are among the earliest industries to attempt to adopt this technology, seeing benefits from lowered costs, reduced risk, and speedier transactions—getting rid of the middleman or central clearinghouse—with estimated savings of $10 billion annually from initial deployment. Studies strategic issues centered around the threat of obsoleting incumbents and industries, developing standards, and dominant consortia. These issues may include deciding between private or public networks, developing smart contracts, responding to fears over data security and data privacy, obtaining top management buy-in, deploying blockchains in industrial and consumer markets, and overcoming resistance to change.

BUSN 6339. International Business in a Semiglobalized World. 1 Hour.
Examines the underlying dynamics of changes in the global market and how they are affecting international business. With increasing movement of capital, goods, services, and labor, we are now seeing an increase in the antiglobalization and anti-immigration sentiment across the world. Pressure for increased protectionism and economic liberalization are occurring across several parts of the world. This has led to a world that is semiglobalized, where forces of integration and localization occur simultaneously. Focuses on the international strategic decisions that companies are making in order to remain competitive and viable in this changing landscape. Studies the role local and multinational companies have in shaping the globalization conversation going forward.

BUSN 6340. Modeling for Business Analytics for Managers. 1 Hour.
Introduces and offers students an opportunity to apply modeling concepts for everyday business management problems. Advanced analytics does not produce business insights without models. Models are the statistical methods and algorithms that look for patterns and relationships from data and express them as mathematical equations. Data scientists are oftentimes needed to create the models and then tweak them to fit changing business needs and conditions. Students use online activities to apply and practice various modeling concepts.

BUSN 6341. Digital Financial Models—How to Value an e-Business. 1 Hour.
Exposes students to the dynamics of the online market space and provides an opportunity to utilize digital analytics tools that provide insight into online customer segments, site visitor behavior, digital marketing strategy and tactics, and historical conversion rates. The valuation of an online business can be difficult if it is not a typical e-commerce business. Explores factors that affect cash flows and cost of capital for such businesses in detail and analyzes the various channels of funding. Offers students an opportunity to conduct an in-class valuation of an e-commerce and lead generation business. Challenges students to build future revenue projections. As a final analysis, class participants are asked to value an online business and submit a paper.

BUSN 6342. Design Value with Creative Problem Solving. 1 Hour.
Covers qualities required for leadership to support and promote innovation, minimize risk of falling behind, and maximize organizational agility, as well as solving problems in creative ways. Exposes students to strategies that help organizations address the following aspects of problem solving, identified as crucial to the success of the enterprise: developing creative, innovative solutions; showing independence and initiative in identifying problems and solving them; solving problems in teams; applying a range of strategies to problem solving; etc.

As the importance of intellectual property (IP) grows, managers and lawyers need to understand IP opportunities and risks and to collaborate effectively during new product development (NPD) in order to establish valid IP assets and effective IP strategies. This course for MBA and JD students will address the legal and business challenges of integrating NPD processes with IP asset development and IP risk management, with an emphasis on establishing and exploiting IP assets for competitive advantage and clearing or minimizing the risk of IP infringement. Students will collaborate on proposals for managing the development of a next generation product to assure timely launch and strategic IP positioning, including developing plans for identifying potential IP assets and defining the team, resources, critical stages and decision points.

BUSN 6864. Experiential Study. 0 Hours.
Offers eligible MSF students an opportunity for experiential study.
**Business Law - CPS (BLW)**

**BUSN 6945. Washington Campus Seminar. 3 Hours.**
Offers a weeklong educational residency in Washington, D.C., where students meet with members of Congress, current and former executive branch officials, senior civil servants, business executives, lobbyists, representatives of the media, and special-interest groups. Offers students an opportunity to understand how Washington works, how legislative and regulatory changes impact their business futures, and what new business opportunities may evolve as the result of federal policy priorities and decisions. The residency seeks to offer unparalleled insight into the process of government, with the goal of enabling top business leaders to contribute ethically and effectively to the policy debate, influence policy outcomes, and leverage their understanding of policy trends to developing new business opportunities.

**BUSN 6950. MBA Skills Workshop. 0 Hours.**
Continues the full-time MBA orientation program. Offers students an opportunity to develop the management skills necessary to become effective managers, including communication skills, qualitative and quantitative business analysis, and ethics and values.

**BUSN 6960. Exam Preparation—Master’s. 0 Hours.**
Offers the student the opportunity to prepare for the master’s qualifying exam under faculty supervision.

**BUSN 6962. Elective. 1-4 Hours.**
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

**BUSN 6964. Co-op Work Experience. 0 Hours.**
Provides eligible students with an opportunity for work experience. May be repeated up to five times.

**BUSN 7976. Directed Study. 1-4 Hours.**
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

**Cardiopulmonary and Exercise Science (EXSC)**

**EXSC 1120. Introduction to Exercise, Fitness, and Health. 4 Hours.**
Explores the fundamental role of exercise and fitness in health. Introduces principles of exercise and various components of fitness and wellness. Discusses the development of basic exercise prescription for cardiorespiratory endurance, muscular strength, and endurance and flexibility. Includes discussions on a wide range of research topics, including advances and innovations in health and fitness and practices that lead to more healthful living.

**EXSC 4500. Exercise Physiology 1. 4 Hours.**
Introduces exercise physiology. Covers the muscular, neuromuscular, cardiovascular, ventilatory, endocrine, and metabolic responses to acute exercise and the physiological adaptations to chronic exercise and physical activity. Basic concepts related to physical fitness, body composition, weight control, and training principles are discussed.

**EXSC 4501. Lab for EXSC 4500. 1 Hour.**
Accompanies EXSC 4500. Offers experiments in the exercise physiology laboratory that introduce concepts related to the lecture content of the course and include techniques such as strength testing, ergometry, graded exercise testing, indirect calorimetry, and body composition assessment.

**EXSC 4990. Elective. 1-4 Hours.**
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

**EXSC 5200. Cardiopulmonary Physiology. 3 Hours.**
Offers students an opportunity to gain an understanding of physiological principles of the cardiopulmonary system. This advanced course covers (1) the structure and functional operation and regulation of the cardiopulmonary system; (2) disease-associated physiological changes and cardiopulmonary dysfunction; (3) exercise-induced acute responses and physiological adaptations of the system and their applications to chronic cardiopulmonary diseases. Encourages students to integrate their knowledge of exercise and physical activity with cardiopulmonary health and fitness, as well as cardiopulmonary disease prevention and treatment. Restricted to graduate students in exercise science and undergraduate students minoring in exercise science.

**EXSC 5210. Physical Activity and Exercise: Prescription, Measurement, and Testing. 3 Hours.**
Studies the general principles of physical activity and exercise prescription, measurement, and testing. Offers students an opportunity to learn the fundamental concepts and techniques to measure physical activity, exercise, and related testing procedures through a hands-on approach. Topics include the use of questionnaires and activity monitors to measure physical activity; measurement of body composition, fitness, muscular strength, and endurance; and clinical exercise testing. The fundamental concepts of exercise prescription and use of measurement techniques taught in this course are applicable to careers in physical therapy, exercise physiology, and as a physician assistant. Requires prior completion of EXSC 4500 or equivalent undergraduate course or permission of instructor.

**EXSC 5220. Advanced Exercise Physiology. 3 Hours.**
Covers the advanced study of concepts, principles, and research in the field of exercise physiology. Discusses advanced concepts in the muscular/neuromuscular, cardiovascular, ventilatory, endocrine, and metabolic responses to exercise and exercise training. Specific study of the physiological control mechanisms regulating these systems are also addressed during periods of rest, acute exercise, and following chronic exercise training.

**EXSC 5230. Physical Activity and Exercise: Effects on Musculoskeletal Health and Disease. 3 Hours.**
Seeks to provide a foundation for understanding the benefits of physical activity and exercise and the detrimental effects of physical inactivity and sedentary behavior on musculoskeletal health. Studies the function/dysfunction of the musculoskeletal systems resulting in common/uncommon disorders and the prevalence, etiology, and benefits of physical activity/exercise. Students apply previously learned exercise physiology principles, such as exercise prescription and neural and motor control adaptations, to physical activity and exercise. Discusses key physiological mechanisms underlying common/uncommon musculoskeletal disorders. Examines the preventive and beneficial effects of physical activity and exercise endorsed by the American College of Sports Medicine. Restricted to graduate students in exercise science and to undergraduate students minoring in exercise science.
EXSC 5976. Directed Study. 1-4 Hours.
Offers independent course work under the direction of members of the department on chosen topics. Requires submission of a written proposal to the program adviser prior to the intended semester. May be repeated without limit.

EXSC 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

EXSC 6202. Electrocardiography, Clinical Assessment, and Prescription. 3 Hours.
Focuses on the identification and management of chronic diseases. Offers students an opportunity to learn skills to interpret EKGs. Topics include cardiac electrophysiology, lead systems, dysrhythmia recognition and treatment, axis, infarction, ischemia, hypertrophy, and the effects of cardiovascular drugs and exercise on the EKG. Through case studies, students interpret exercise test results, prescribe exercise, and evaluate exercise programs for clinical conditions such as cardiovascular disease, pulmonary conditions, and metabolic diseases.

EXSC 6222. Exercise in Health and Disease. 3 Hours.
Studies the role of exercise in health and disease, including acute and chronic effects of exercise on individuals with cardiovascular, pulmonary, metabolic, and immunology diseases and disorders. Also explores exercise prescriptions, training guidelines, and therapeutic benefits of exercise intervention and rehabilitation for individuals with heart disease, vascular disease, chronic obstructive pulmonary disease, diabetes, obesity, renal failure, cancer, and immunological disorders.

EXSC 6263. Research Design and Methodology. 3 Hours.
Covers research and evaluation methods and techniques commonly used in healthcare and exercise science including problem selection, literature review, instrumentation, methodology, statistical analyses, and the writing of research reports and articles. Includes the interpretation of published research and intensive practice of scientific writing techniques, application of statistical analyses, and application of research methodologies.

EXSC 6300. Internship in Exercise Science. 3 Hours.
Offers students an opportunity to obtain practical experience and to synthesize, integrate, and apply skills and knowledge learned in the exercise science curriculum in a professional environment. Field experiences are an important part of graduate education programs in the exercise science curriculum in a professional environment. The student is expected to complete a minimum of 300 hours of supervised experience in a research or practice setting. May be repeated once.

EXSC 6400. Applied Research Methods. 3 Hours.
Studies how to conduct scientific research in exercise science. Offers students an opportunity to propose a research project and design appropriate methodology to complete the project. Includes discussions on developing research hypotheses, comparing study designs, selecting appropriate statistical analyses, and managing data collection. Incorporates interpretation of published research to support the proposed research. Students present their own research plans through scientific writing.

EXSC 6401. Clinical Exercise Physiology Internship 1. 3 Hours.
Provides a supervised internship experience in a clinical exercise physiology program or a clinical exercise-testing laboratory, providing care to individuals with chronic cardiovascular, pulmonary, metabolic, or musculoskeletal diseases. Affords students the opportunity to participate in clinical exercise testing, exercise prescription and programming, and/or exercise leadership under the supervision of a clinical exercise physiologist. Requires students to present relevant case studies during weekly seminar discussions. Requires 3.00 GPA and B– or better in all professional courses in the first-year curriculum in clinical exercise physiology.

EXSC 6402. Clinical Exercise Physiology Internship 2. 3 Hours.
Continues EXSC 6401. Provides a supervised internship experience in a clinical exercise physiology program or a clinical exercise-testing laboratory, providing care to individuals with chronic cardiovascular, pulmonary, metabolic, or musculoskeletal diseases. Affords students the opportunity to participate in clinical exercise testing, exercise prescription and programming, and/or exercise leadership under the supervision of a clinical exercise physiologist. Requires students to present relevant case studies during weekly seminar discussions.

EXSC 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EXSC 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

EXSC 7990. Thesis 1. 3 Hours.
Provides initiation to scholarly investigation. Requires students to submit a written research proposal, which includes the first three chapters of the thesis (introduction, review of literature, and methods and procedures) for approval by a thesis committee and to present an oral proposal at a seminar. May be repeated once.

EXSC 7991. Thesis 2. 3 Hours.
Continues EXSC 7990.

EXSC 7996. Thesis Continuation. 0 Hours.
Offers continuation of thesis work with data collection, statistical analysis, presentation of results, discussion, and recommendations for further study. Culminates in an approved written thesis.

CDV 0100. Personal Leadership and Career Development. 3 Hours.
Seeks to provide a forum for students to critically analyze and reflect on the connections between academic learning, personal skills, and career goals. Asks students to investigate the challenges, opportunities, standards, and implications of their career interests through self-reflection activities and industry research. Offers students an opportunity to engage in a portfolio assessment process designed to determine when the student is ready to engage in a work-based learning component. The goal is that, upon successful completion of the course, the student should be able to identify leadership opportunities and techniques and have a personal career development plan outlining necessary steps to build educational credentials and relevant soft and hard skills.

CDV 0102. Career Readiness and Experiential Learning. 1-6 Hours.
Designed to provide a forum for students to investigate different careers and to report on the academic requirements, skills, and dispositions necessary for success in target industries. Offers students exposure to different industries and careers through course work, panel discussions, and industry site visits. May be repeated for up to 10 total credits.
CDV 0115. College and Career Exploration. 1.8 Hour.
Introduces the tools, techniques, methods, procedures, skills, and resources necessary for success in college and in the workplace. Topics include time management, study skills, navigating through college, diversity and social change, mind/body wellness, career exploration, work readiness, and fiscal planning.

CDV 0220. The College Experience 1. 1.2 Hour.
Introduces students to strategies for college success, with emphasis on time management, academic responsibility, note taking, test taking, and appropriate communication with professors and administrators. Explores in-depth the skills required for success in college. Challenges students to analyze their strengths and shortcomings as well as practice strategies for improvement. Restricted to Foundation Year students.

CDV 0225. The College Experience 2. 1.2 Hour.
Introduces students to the often complex systems existing on a college campus, and seeks to provide students with insight into negotiating and problem-solving challenges associated with financial aid, academic credit, academic standing, and major selection. The goal of the course is to demystify college systems and increase student knowledge and confidence about resources on campus and ways in which to access them. Restricted to Foundation Year students.

CDV 0230. The College Experience 3. 1.2 Hour.
Focuses on various aspects of the college transfer process, including credit transfer, financial aid, and housing. Emphasizes planning one’s approach to transitioning, with an emphasis on self-care and astute attention to detail. Restricted to Foundation Year students.

**Chemical Engineering (CHME)**

CHME 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHME 2000. Introduction to Engineering Co-op Education. 1 Hour.
Offers students an opportunity to prepare for their first co-op experience. Focuses on preparation skills including résumé construction, interviewing techniques, networking, and job selection using the Northeastern online database. Facilitates a basis for successful co-op engagement including expectations and requirements, self-assessment and goal setting, professional behaviors and values, and decision making during the job search process and while on the job.

CHME 2308. Conservation Principles in Chemical Engineering. 4 Hours.
Examines the applications of fundamental laws of mass and energy conservation to chemical and physical processes. Emphasizes material and energy balances on chemical processes. Offers students an opportunity to develop skills in applying chemistry, physics, and mathematics to identify and solve chemical engineering problems.

CHME 2310. Transport Processes 1. 4 Hours.
Covers the fundamental principles of processes in which mass, energy, and momentum are transported. Emphasizes momentum transport for incompressible and compressible fluids (fluid flow) and energy transport. The concepts are continued in CHME 3312 with emphasis on heat and mass transport with separation processes. The methods taught are relevant to the analysis of engineering processes in a number of industries including chemical, pharmaceutical, food, energy, biotechnology, and materials.

CHME 2311. Lab for CHME 2310. 2 Hours.
Accompanies CHME 2310. Uses experiment and simulation to explore the principles of momentum and heat transport. Offers students an opportunity to obtain practical laboratory experience and to develop technical writing and oral presentation skills. Students are asked to both design and perform experiments in the context of current fields of chemical engineering, to discover fundamental transport principles, and to develop engineering solutions through experiments using the fundamental transport principles.

CHME 2320. Chemical Engineering Thermodynamics 1. 4 Hours.
Covers the first and second laws of thermodynamics and their application to batch and flow systems, heat effects in chemicals, and physical properties/real fluids. Applies basic principles and mathematical relations to the analysis and solution of engineering problems.

CHME 2322. Chemical Engineering Thermodynamics 1 Abroad. 4 Hours.
Covers the first and second laws of thermodynamics and their application to batch and flow systems, heat effects in chemicals, and physical properties/real fluids. Applies basic principles and mathematical relations to the analysis and solution of engineering problems. Taught abroad. May be repeated without limit.

CHME 2949. Introductory Directed Research in Chemical Engineering. 4 Hours.
Offers first- and second-year students an opportunity to pursue project and other independent inquiry opportunities under faculty supervision. The course is initiated with a student-developed proposal, including expected learning outcomes and research products, which is approved by a faculty member in the department. Requires permission of instructor.

CHME 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHME 3000. Professional Issues in Engineering. 1 Hour.
Offers students an opportunity to reflect on both academic and co-op experiences in the context of planning for their senior year and beyond. Focuses on developing advanced skills in preparation for graduation including job searches, professional résumés, cover letter writing, career portfolios, negotiations, and corporate culture. Reviews the prospect of graduate school training. Discusses issues around safety and ethical challenges; resolving ethical conflicts; awareness of engineers as professionals in a diverse world; strengthening decision-making skills; and lifelong learning needs, goals, and strategies. Explores leading-edge chemical engineering topics through presentation and case studies. Examines the role of different work and learning styles and diverse personal characteristics in the workplace and the classroom.

CHME 3312. Transport Processes 2 and Separations. 4 Hours.
Continues CHME 2310. Presents the fundamentals and applications of energy transport, mass transport, and simultaneous energy/mass transport. Emphasizes separation processes using these principles. The methods taught are relevant to the analysis of engineering processes in a number of industries including chemical, pharmaceutical, food, energy, biotechnology, and materials.

CHME 3313. Lab for CHME 3312. 2 Hours.
Accompanies CHME 3312. Uses experiment and simulation to explore the principles of mass transport and separation processes. Offers students an opportunity to obtain practical laboratory experience and to develop technical writing and oral presentation skills. Students are asked to both design and perform experiments in the context of current fields of chemical engineering, to discover fundamental transport principles, and to develop engineering solutions through experiments using the fundamental transport principles.
CHME 3315. Chemical Engineering Laboratory 1. 4 Hours.
Offers students an opportunity to obtain hands-on laboratory experience and to develop safety, teamwork, problem-solving, organizational, technical writing, and oral presentation skills. Focuses on fundamental momentum transport principles and skills to develop and design engineering solutions through experiments in the context of the current fields of chemical engineering. Emphasizes the hazards associated with those chemical engineering experiments.

CHME 3322. Chemical Engineering Thermodynamics 2. 4 Hours.
Continues CHME 2320. Covers thermodynamic properties of mixtures; fugacity and the fugacity coefficients from equations of state for gaseous mixtures; liquid phase fugacities and activity coefficients for liquid mixtures; phase equilibriums; the equilibrium constant for homogeneous gas-phase reactions; and extension of theory to handle simultaneous, heterogeneous, and solution reactions.

CHME 3330. Chemical Engineering Process Analysis. 4 Hours.
Covers methods of mathematical analysis applied to chemical engineering problems. Includes use of computational software developed especially for the chemical engineering discipline. Develops linear and nonlinear problems for various chemical engineering applications. Demonstrates numerical and analytic solution methods. A number of examples are based on separation applications encountered in various chemical engineering specialties.

CHME 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHME 4315. Chemical Engineering Laboratory 2. 4 Hours.
Covers fundamental theories of the rate of chemical change in homogeneous reacting systems, integral and differential analysis of kinetic data; design of batch and continuous-flow chemical reactors; and an introduction to heterogeneous reactions and reactor design.

CHME 4510. Chemical Engineering Kinetics. 4 Hours.
Covers Laplace transform and its use in solving ordinary differential equations; modeling liquid-level, temperature, and composition dynamics; linearization of nonlinear systems; first- and second-order system transfer functions; control valve sizing, and PID control; computer simulation of open- and closed-loop systems; control system stability; and feed-forward and cascade control.

CHME 4624. Chemical Process Safety. 4 Hours.
Introduces students to important technical fundamentals as applied to chemical process safety. Demonstrates good chemical process safety practice through chemical plant trips, visiting experts, and video presentations.

CHME 4625. Chemical Process Safety Abroad. 4 Hours.
Continues CHME 4722. Builds upon the previous course. Requires lab fee.

CHME 4699. Special Topics in Process Safety Abroad. 4 Hours.
Covers special topics unique to the host country as related to chemical process safety. Includes chemical plant visits, review of specialized testing methods used in process safety, as well as national and international compliance requirements. May be repeated without limit.

CHME 4634. Nanomaterials: Thin Films and Structures. 4 Hours.
Focuses on topics related to chemical engineering to be selected by instructor. May be repeated without limit.

CHME 4701. Capstone Design 1: Process Analysis. 4 Hours.
Focuses on the design of a chemical process with a particular emphasis on separation technologies. Topics include computer simulation of steady-state processing conditions, selecting process operations, reactor design, preparing flow sheets and stream tables, and evaluating the economics of a chemical process design.

CHME 4703. Capstone Design 2: Chemical Process Design. 4 Hours.
Continues CHME 4701. Requires each student to solve a comprehensive chemical process design problem. Topics include heat and power integration in chemical processing, design and scheduling of batch processes, sequencing separation operations, and safety considerations in process design.

CHME 4721. Projects 1. 4 Hours.
Offers individual research related to some phase of chemical engineering. Open only to students selected by the department head on the basis of scholarship and proven ability. Requires lab fee.

CHME 4722. Projects 2. 4 Hours.
Focuses on the hazards associated with these chemical engineering experiments and the materials handled during laboratory.

CHME 4721. Projects 1. 4 Hours.
Continues CHME 4722. Builds upon the previous course. Requires lab fee.

CHME 4790. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

CHME 4791. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

CHME 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHME 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated up to two times.

CHME 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CHME 4993. Independent Study. 1-4 Hours.
Offers theoretical or experimental work under individual faculty supervision. May be repeated without limit.
CHME 4994. Internship. 4 Hours.  
Offers students an opportunity for internship work. May be repeated without limit.

CHME 4996. Experiential Education Directed Study. 4 Hours.  
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using the course to fulfill their experiential education requirement. May be repeated without limit.

CHME 5101. Fundamentals of Chemical Engineering Analysis. 4 Hours.  
Provides graduate students from undergraduate studies outside traditional chemical engineering with a practical understanding of the core principles behind the chemical engineering discipline. Topics include vector and tensor calculus; continuum mechanics and thermodynamics; macroscopic and microscopic analyses of mass, momentum, and energy conservation; the fundamental principles of processes in which mass, energy, and momentum are transported; consequences of the Second Law of Thermodynamics, the principles governing phase and chemical reaction equilibrium; the fundamental theories of chemical reaction kinetics and reactor design; and the mathematical formulation and solution of the underlying equations involved in all these topics.

CHME 5137. Computational Modeling in Chemical Engineering. 4 Hours.  
Builds on chemical engineering fundamentals to introduce computer programming to allow simulation of physical, chemical, and biological systems. Covers numerical experiments (e.g., Monte Carlo, global sensitivity analysis) to analyze the significance of parameters and model assumptions. Offers students an opportunity to work on a research or design project throughout the course.

CHME 5160. Drug Delivery: Engineering Analysis. 4 Hours.  
Focuses on engineering analysis of drug delivery systems, demonstrating the application of classic engineering principles to a nontraditional field for chemical engineers. Presents quantitative analysis of transport of a drug through the body and its control by physical and chemical drug and drug delivery device properties. Emphasizes the influence of biological tissue composition and structure on these processes.

CHME 5204. Heterogeneous Catalysis. 4 Hours.  
Explores design principles of gas-solid catalytic reactors. Covers heterogeneous catalysts, adsorption surface area and pore structure of catalysts, and mass and heat transport in porous catalysts. Studies catalyst preparation and industrial catalytic processes.

CHME 5240. Introduction to Polymer Science. 4 Hours.  
Introduces basic concepts of polymers and polymer properties. Designed for both undergraduate and graduate students, and requires no prior knowledge of polymers. Covers macromolecular structure from both theoretical and experimental viewpoints, polymerization processes and kinetics, polymer/solvent thermodynamics, crosslinking and network dynamics, thermal and phase behavior of polymers, viscoelasticity and mechanical behavior, diffusion in polymers, and selected advanced topics.

CHME 5260. Special Topics in Chemical Engineering. 4 Hours.  
Covers topics of interest to the staff member conducting this course for advanced study. A student may not take more than one special topics course with any one instructor. May be repeated without limit.

CHME 5510. Fundamentals in Process Safety Engineering. 4 Hours.  
Introduces the basic concepts in process safety engineering as applied to the process industries as well as various terms and lexicon. Reviews the fundamentals involved in the prediction of scenarios and covers the assumptions involved as well as the range of these predictions. Emphasizes toxicology, industrial hygiene, sources models, toxic releases, and dispersion models, as well as fire and explosion prevention.

CHME 5520. Process Safety Engineering—Chemical Reactivity, Reliefs, and Hazards Analysis. 4 Hours.  
Reviews chemical reactivity hazards. Introduces relief methods and sizing estimation to prevent overpressurization vessel damage. Covers methods of hazards identification and risk assessment. Offers students an opportunity to obtain the ability to lead hazards analysis in any organization at any level.

CHME 5630. Biochemical Engineering. 4 Hours.  
Focuses on topics relevant to the design of cell culture processes for the production of pharmaceuticals. Topics include an overview of prokaryotic vs. eukaryotic cells; enzyme kinetics; overview of cellular processes (DNA replication, transcription, translation, primary metabolism, and regulation of protein synthesis at the transcriptional, posttranslational, and metabolic levels); overview of genetic engineering methods (for bacteria, mammalian, and plant cells); kinetics of cell growth (growth models, growth kinetic parameters); kinetics of product formation; bioreactor design and optimum operating conditions; scale-up; and overview of product recovery and purification methods.

CHME 5631. Biomaterials Principles and Applications. 4 Hours.  
Offers a broad overview of the field of biomaterials (materials used in medical devices that interact with living tissues). Begins with introductory lectures on biomaterials and their translation from the laboratory to the medical marketplace and progresses to discussions of important biomaterials terminology and concepts. Basic materials science lectures then emphasize material structure-property-function-testing relationships. Concludes with introductions to topics in the field such as biomaterials-tissue interactions, tissue engineering, regulatory requirements, etc. Considers principles of device design as related to the selection and application of biomaterials throughout this course.

CHME 5632. Advanced Topics in Biomaterials. 4 Hours.  
Addresses several important topics in biomaterials, specifically, materials used in medical devices that communicate with living tissues. Topics that may be addressed include biomaterials: past, present, and future; tissue engineering: scope, status, promise, challenges; biomaterials-tissue interactions; regulated medical device design, fabrication, and testing; strategies for translating medical products from concept to the marketplace; and medical device disasters. Some topics are covered in more depth than others depending on their value and interest to the students.

CHME 5699. Special Topics in Chemical Engineering. 4 Hours.  
Focuses on topics related to chemical engineering to be selected by the instructor. May be repeated up to two times.

CHME 5899. Biotechnology. 4 Hours.  
Introduces biotechnology to students who are not majoring in biological sciences. The goal is to cover fundamental concepts, principles, and technologies central to the modern biotechnology industry. Topics range from, but are not limited to, recombinant DNA technologies; genomics, proteomics, and epigenetics; viruses, vaccines, and gene therapy; stem cell biology; genetically modified organisms (GMOs); synthetic biology; drug discovery and development; and regulatory issues in the biotechnology and biopharmaceutical industries.

CHME 5976. Directed Study. 1-4 Hours.  
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CHME 5978. Independent Study. 1-4 Hours.  
Offers theoretical or experimental work under individual faculty supervision. May be repeated without limit.
CHME 5984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CHME 6610. Computational Programs in Process Safety for Relief and Scenario Modeling. 4 Hours.
Focuses on the use of process safety software that is available to perform hazard analysis, relief and flare system evaluation, and scenario analysis. The software may include use of Process Safety Office (iO-Mosaic), Aspen Process Simulator (Aspen Technologies), and FLACS (Flame Acceleration Simulator by GexCon). These programs are dedicated to predicting relief sizing for vessels and processes; flare system sizing; chemical reactivity analysis; and dispersion modeling, should a release occur, and its damage potential either as an explosive or toxic cloud.

CHME 6960. Exam Preparation—Master’s. 0 Hours.
Offers the student the opportunity to prepare for the master’s qualifying exam under faculty supervision.

CHME 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHME 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

CHME 6965. Co-op Work Experience Abroad. 0 Hours.
Provides eligible students with an opportunity for work experience abroad. May be repeated without limit.

CHME 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

CHME 7201. Fluid Mechanics. 4 Hours.
Examines statics, kinematics, and stress concepts associated with fluids. Also focuses on the formation of the general equations of motion with application to laminar and turbulent flow. Topics include boundary layer theory and compressible flow.

CHME 7202. Chemical Process Heat Transfer. 4 Hours.
Covers empirical methods and calculations used to design heat transfer equipment for the chemical process industries. Reviews basic heat transfer principles. Focuses on shell-and-tube calculations for liquid and/or vapor phase heat transfer. Also covers direct contact and other special heat exchanger applications.

CHME 7203. Separations Process. 4 Hours.
Comprises calculation and design methods used in processes involving mass transfer. Topics include vapor liquid equilibria for binary and multicomponent systems, and multicomponent distillation, absorption, and extraction. Emphasis is on methods and techniques common to many separation processes.

CHME 7205. Numerical Techniques in Chemical Engineering. 4 Hours.
Examines digital computer applications to chemical engineering problems. Topics include location of roots of linear and nonlinear equations, numerical integration, and curve-fitting techniques, with emphasis on the numerical solution of ordinary and partial differential equations and on linear algebra.

CHME 7210. Advanced Chemical Engineering Calculations. 4 Hours.
Focuses on fundamental process principles leading to an understanding of the stoichiometric principles of chemical process plants. Undertakes the study of complex material and energy balances with the view to apply these principles to actual large chemical plant conditions. Requires familiarity with differential equations.
CHME 7241. Principles of Polymerization and Polymer Processing. 4 Hours.
Introduces polymers and polymer properties. Examines mechanisms of polymerization including step polymerization, radical chain polymerization, emulsion polymerization, ionic chain polymerization, chain copolymerization, and ring-opening polymerization. Focuses on stereochemistry of polymerization and synthetic reactions of polymers. Also covers applications to reactor design of industrially important polymers.

CHME 7250. Advanced Management Techniques in the Chemical Industry. 4 Hours.
Comprises management techniques applied to the chemical industry. Emphasis is on management of research organizations and management of engineering services, such as design, computer, and related activities.

CHME 7260. Special Topics in Chemical Engineering. 4 Hours.
Covers topics of interest to the staff member conducting this class for advanced study. A student may not take more than one Special Topics course with any one instructor. May be repeated without limit.

CHME 7261. Special Topics in Chemical Engineering. 2 Hours.
Covers topics of interest to the staff member conducting this class for advanced study. A student may not take more than one Special Topics course with any one instructor. May be repeated without limit.

CHME 7262. Special Topics in Process Safety. 4 Hours.
Covers topics of interest to the staff member conducting this class for advanced study. Current topics relevant in process safety are considered, such as a focus on layers of protection analysis, qualitative risk analysis, and specific process safety challenges. Process safety challenges from industrial settings may also serve as problems tackled in the course. A student may not take more than one special topics course with any one instructor.

CHME 7320. Chemical Engineering Mathematics. 4 Hours.
Focuses on the formulation and solutions of problems involving advanced calculus as they arise in chemical engineering systems. Covers ordinary differential equations, series solutions, and complex variables. Also studies applications involving Laplace transforms, partial differential equations, matrix operations, vectors and tensors, and optimization methods. Emphasis is on methods for formulating the problems.

CHME 7330. Chemical Engineering Thermodynamics. 4 Hours.
Designed as an introductory course to graduate-level, classical thermodynamics. Covers the first and second laws, and their applications to problems of interest to the chemical engineer. Introduces Legendre transformation, multicomponent phase equilibrium, and stability as well as reaction equilibrium in an engineering context.

CHME 7340. Chemical Engineering Kinetics. 4 Hours.
Covers fundamental theories of the rate of chemical change in homogeneous reacting systems, integral and differential analysis of kinetic data. Examines the theoretical foundations for the analysis of elementary chemical reaction rates. Comprises analysis and modeling of batch and ideal flow reactors, axial and radial dispersion in flow tubular reactors, and design principles of gas solid catalytic reactors. Builds on undergraduate chemical engineering kinetics concepts. Requires proficiency in calculus and differential equations.

CHME 7350. Transport Phenomena. 4 Hours.
Explores analytical and approximate solutions of equations of momentum, energy, and mass transport and their analogies. Covers heat and mass transfer at a fluid-solid interface. Introduces creeping, potential, and boundary layer flows. Examines macroscopic balances for isothermal systems and interphase transport of multicomponent systems.

CHME 7390. Seminar. 0 Hours.
Presents topics of an advanced nature by staff, outside speakers, and students in the graduate program. This course must be attended every semester by all full-time graduate students. May be repeated without limit.

CHME 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHME 7976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CHME 7978. Independent Study. 1-4 Hours.
Offers theoretical or experimental work under individual faculty supervision. May be repeated without limit.

CHME 7990. Thesis. 1-4 Hours.
Offers analytical and/or experimental work conducted under the direction of the faculty in fulfillment of the requirements for the degree. First-year students must attend a graduate seminar program that introduces the students to the methods of choosing a research topic, conducting research, and preparing a thesis. Successful completion of the seminar program is required. May be repeated without limit.

CHME 7994. Thesis Continuation—Part Time. 0 Hours.
Continues thesis work conducted under the supervision of a departmental faculty member. May be repeated without limit.

CHME 7996. Thesis Continuation. 0 Hours.
Continues thesis work conducted under the supervision of a departmental faculty.

CHME 8960. Candidacy Preparation—Doctoral. 0 Hours.
Offers students an opportunity to prepare for the PhD qualifying exam under faculty supervision. Intended for students who have completed all required PhD course work and have not yet achieved PhD candidacy; students who have not completed all required PhD course work are not allowed to register for this course. May be repeated once.

CHME 8964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

CHME 8966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

CHME 8982. Readings. 1-4 Hours.
Offers selected readings under the supervision of a faculty member. May be repeated without limit.

CHME 8984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CHME 8986. Research. 0 Hours.
Offers an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

CHME 9000. PhD Candidacy Achieved. 0 Hours.
Indicates successful completion of program requirements for PhD candidacy.

CHME 9984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CHME 9986. Research. 0 Hours.
Offers an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.
CHME 9990. Dissertation. 0 Hours.
Offers theoretical and experimental work conducted under the supervision of a departmental faculty. May be repeated once.

CHME 9996. Dissertation Continuation. 0 Hours.
Continues thesis work conducted under the supervision of a departmental faculty. CHME 9990 completed twice. May be repeated without limit.

**Chemistry - CPS (CHM)**

CHM 1100. General Chemistry 1. 3 Hours.
Introduces the principles of chemistry. Topics include basic principles and definitions, stoichiometry, chemical equilibrium, moles, gas laws, atomic structure, periodic relationships, and chemical bonding.

CHM 1101. Lab for CHM 1100. 1 Hour.
Accompanies CHM 1100. Covers a range of topics from the course.

CHM 1200. General Chemistry 2. 3 Hours.
Studies the principles of chemical equilibrium and the rates and mechanisms of chemical reactions. Covers solutions, chemical kinetics, chemical equilibria, chemical thermodynamics, and electrochemistry.

CHM 1201. Lab for CHM 1200. 1 Hour.
Accompanies CHM 1200. Covers a range of topics from the course, such as measurements of heat transfer, rate and equilibrium constants, acid-base reactions, the properties and uses of buffer systems, and the effects of temperature and catalysts.

CHM 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHM 2110. Organic Chemistry 1. 3 Hours.
Introduces nomenclature, synthesis, molecular structure and bonding, and reaction mechanisms. Includes chemistry of hydrocarbons and their functional derivatives, stereoisomerism and stereochemistry, and nucleophilic substitutions, and elimination reactions.

CHM 2111. Lab for CHM 2110. 1 Hour.
Accompanies CHM 2110. Introduces basic laboratory techniques, such as distillation, crystallization, extraction, chromatography, characterization by physical methods, and measurement of optical rotation, which serve as the foundation for the synthesis, purification, and characterization of products from microscale syntheses.

CHM 2200. Organic Chemistry 2. 3 Hours.
Continues CHM 2110. Focuses on additional functional group chemistry, including alcohols, ethers, carbonyl compounds, amines, and the molecules of nature. Introduces spectroscopic methods for structural identification.

CHM 2201. Lab for CHM 2200. 1 Hour.
Accompanies CHM 2200. Applies basic laboratory techniques from CHM 2111 to chemical reactions of alcohols, ethers, carbonyl compounds, carbohydrates, and amines. Introduces basic laboratory techniques and instruments for the structural analysis of organic molecules.

CHM 2300. Analytical Chemistry. 3 Hours.
Introduces the principles and practices in the field of analytical chemistry. Focuses on development of a quantitative understanding of homogeneous and heterogeneous equilibria phenomena as applied to acid-base and complexometric titrations, rudimentary separations, optical spectroscopy, and statistical, electrochemistry, and statistics.

CHM 2301. Lab for CHM 2300. 1 Hour.
Accompanies CHM 2300. Offers students an opportunity to obtain hands-on experience in lab experiments in analytical methods, including silver chloride gravimetry, complexometric titrations, acid-base titrations, UV-Vis spectroscopy, cyclic voltammetry, Karl Fischer coulometry, and modern chromatography.

CHM 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHM 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHM 4896. Experiential Education Directed Study. 1-4 Hours.
Offers a range of topics from the course, such as measurement of heat transfer, rate and equilibrium constants, acid-base reactions, properties and uses of buffer systems, and the effects of temperature and catalysts.

CHM 493. Topics. 1-4 Hours.
Covers special topics in chemistry. May be repeated without limit.

CHM 4983. Topics. 1-4 Hours.
Covers special topics in chemistry. May be repeated without limit.

CHM 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHM 4991. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

CHM 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

CHM 4993. Independent Study. 1-4 Hours.
Offers students the opportunity to design and complete a research project in chemistry.

CHM 4994. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

CHM 4995. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

CHM 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

CHM 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

CHM 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

CHM 6501. The Particulate Nature of Matter. 4 Hours.
Offers an in-depth study of selected topics.
CHM 6502. The Energetics of Chemical Change. 4 Hours.
Offered in-depth exploration of fundamental principles of equilibrium, thermodynamics, and kinetics as these principles apply to chemistry. Emphasizes the relationships among these principles and the role they play in the chemistry of life.

CHM 6503. Structure and Function. 4 Hours.
Offered pre- and in-service teachers the opportunity to learn useful and usable in-depth knowledge of organic/bioorganic chemistry that is necessary for effective chemistry and biology instruction on the secondary school level. Focuses primarily on the understanding of basic organic reaction mechanisms and on their relevance in our daily life. Outside of classroom work, involvement in laboratory activities, computational modeling, outside reading, peer classroom presentations, and in-depth discussions of the topics covered.

CHM 6504. Equilibrium and Thermochemistry. 4 Hours.
Focuses on energetics of chemical reactions and is designed to support the professional development of high school teachers. Using current and future curriculum materials, as well as state and national standards for the teaching of chemistry at the high school level, this course offers an in-depth exploration of fundamental principles of equilibrium, solubility, acid-base reaction, electrochemistry, and thermodynamics.

CHM 6506. Metrics, Chemistry, and Motion. 4 Hours.
Focuses on metric measurement, chemistry, and nutrition. Offers students an opportunity to learn how to measure basic chemical concepts related to changes in the kitchen, such as the classification of matter, properties and changes in matter, the periodic table, states of matter, and acids and bases, affect cooking and baking. Shifts to biochemistry as a means of studying the food pyramid, the major nutrients, and the classification of foods. Uses metric measurement to quantify amounts of various nutrients in the food eaten every day.

CHM 6511. Lab-Based Chemistry for Teachers in Grades 6–10. 4 Hours.
Incorporates classroom- and lab-based activities to help participants develop their competencies to teach chemistry and to align their teaching to the Massachusetts curriculum frameworks in high school chemistry and middle school physical science. Lectures, lecture-demonstrations, and collaborative investigations focus on how to teach the nature of the physical (e.g., density, viscosity, and solubility) and the chemical properties of substances, changes of physical state, the properties of solutions, acids and bases, the atomic model of matter, chemical formulas and nomenclature, and chemical reactions. The lab portion uses a computer-based sensor and traditional apparatus to conduct experiments and gather and analyze data. Uses pre- and posttests to assess learning.

CHM 6530. AP (Advanced Placement) Chemistry. 1-4 Hours.
Designed for current or future high school teachers of chemistry. Integrates critical topics through the six big understandings in chemistry (composition of matter, physical properties of matter, chemical changes, rates of reaction, energy in chemical systems, chemical equilibrium) with the process skills necessary for success in science. Reviews data related to student performance on advanced course work such as the AP exam. Offers students an opportunity to address multiple ways to prepare their classrooms for challenges while taking AP courses and prework to an AP course. Although the course work is best suited for educators who teach or have taught advanced College Board AP chemistry exam prep or capstone chemistry courses for high school juniors or seniors, teachers of other grade levels are welcome to participate.

CHM 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

CHM 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHM 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

CHM 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

CHM 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

CHM 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

CHM 6983. Topics. 1-4 Hours.
Offers in-depth exploration of selected topics. May be repeated without limit.

CHM 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student's major field. May be repeated without limit.
CHEM 1107. Introduction to Forensic Chemistry. 4 Hours.
Introduces students to forensic science from a fundamental, chemical perspective. Explores the challenges and methodologies of forensic chemistry, and examines some misrepresentations of forensics by television dramas. Covers drug analysis, arson investigation, DNA analysis, as well as other relevant topics.

CHEM 1117. Chemical Perspectives on Energy. 4 Hours.
Examines the chemical principles that underly the major sources of energy for society, including combustion of fossil fuels, biofuels, batteries, solar energy, and nuclear power. Examines the costs and benefits to society of each energy source. Does not substitute for CHEM 1101, CHEM 1151, or CHEM 1211. High school chemistry strongly recommended.

CHEM 1118. Recitation for CHEM 1117. 0 Hours.
Offers a small-group recitation setting for discussion of homework problems and completing group exercises in CHEM 1117.

CHEM 1151. General Chemistry for Engineers. 4 Hours.
Corresponds to one semester of study in important areas of modern chemistry, such as details of the gaseous, liquid, and solid states of matter; intra- and intermolecular forces; and phase diagrams. Presents the energetics and spontaneity of chemical reactions in the context of chemical thermodynamics, while their extent and speed is discussed through topics in chemical equilibria and kinetics. Aspects of electrochemical energy storage and work are considered in relation to batteries, fuel, and electrolytic cells.

CHEM 1152. Lab for CHEM 1151. 1 Hour.
Accompanies CHEM 1151. Complements and reinforces the material in CHEM 1151 with emphasis on examples of interest in the context of modern materials, energy storage, and conversion.

CHEM 1153. Recitation for CHEM 1151. 0 Hours.
Accompanies CHEM 1151. Offers a weekly sixty-five-minute drill/discussion session conducted by chemistry faculty or graduate teaching assistants. Discusses the homework assignments of CHEM 1151 in detail with emphasis on student participation.

CHEM 1211. General Chemistry 1. 4 Hours.
Introduces the principles of chemistry, focusing on the states and structure of matter and chemical stoichiometry. Presents basic concepts and definitions, moles, gas laws, atomic structure, periodic properties and chemical bonding, all within a contextual framework.

CHEM 1212. Lab for CHEM 1211. 1 Hour.
Accompanies CHEM 1211. Covers a range of topics from the course including qualitative and quantitative analysis and the characteristics of chemical and physical processes.

CHEM 1213. Recitation for CHEM 1211. 0 Hours.
Accompanies CHEM 1211. Covers various topics from the course.

CHEM 1214. General Chemistry 2. 4 Hours.
Continues CHEM 1211. Introduces the principles of chemical equilibrium, the rates and mechanisms of chemical reactions, and energy considerations in chemical transformations. Covers solutions, chemical kinetics, chemical equilibria, chemical thermodynamics, electrochemistry, and chemistry of the representative elements. Such contextual themes as energy resources, smog formation, and acid rain illustrate the principles discussed.

CHEM 1215. Lab for CHEM 1214. 1 Hour.
Accompanies CHEM 1214. Covers a range of topics from the course, such as measurements of heat transfer, rate and equilibrium constants, and the effects of temperature and catalysts. Particular attention is paid to aqueous acid-base reactions and to the properties and uses of buffer systems. Quantitative analysis of chemical and physical systems is emphasized throughout.

CHEM 1216. Recitation for CHEM 1214. 0 Hours.
Accompanies CHEM 1214. Covers various topics from the course.

CHEM 1217. General Chemistry 1 for Chemical Science Majors. 4 Hours.
Offers the first of a two-semester sequence (with CHEM 1220) that introduces students majoring or intending to major in chemistry to the principles of chemistry with an emphasis on relating the macroscale physical and chemical properties of substances to the structure and behavior of the particles (atomic particles, ions, and molecules) of which they are composed. Explores the connections between chemistry and the other sciences, particularly the life and environmental sciences. Topics include atomic and molecular structure, bonding theories, intermolecular interactions, reactions in the gas phase and in aqueous solutions, the energetics of chemical change, and the properties of gases and solutions.

CHEM 1218. Lab for CHEM 1217. 2 Hours.
Accompanies CHEM 1217. Explores nuclear chemistry, atomic structure, chemical reactions in the gas phase and in solutions, chemical bonding, intermolecular forces, and the properties of gases. The results of experiments form the basis for problem-solving sessions in CHEM 1217.

CHEM 1219. Recitation for CHEM 1217. 0 Hours.
Accompanies CHEM 1217. Provides students with opportunities to work interactively with instructors and other students to learn and apply the scientific method.

CHEM 1220. General Chemistry 2 for Chemical Science Majors. 4 Hours.
Continues CHEM 1217. Offers the second of a two-semester sequence (following CHEM 1217) of guided inquiries into the principles of chemistry including the structure of solids, thermochemistry, thermodynamics, chemical kinetics, chemical equilibrium, acids and bases, and electrochemistry and materials chemistry.

CHEM 1221. Lab for CHEM 1220. 2 Hours.
Accompanies CHEM 1220. Explores the structure of solids, thermochemistry, thermodynamics, chemical kinetics, chemical equilibrium, acids and bases, and electrochemistry and materials chemistry. The results of experiments form the basis for problem-solving sessions in CHEM 1220.

CHEM 1222. Recitation for CHEM 1220. 0 Hours.
Accompanies CHEM 1220. Provides students with opportunities to work interactively with instructors and other students to learn and apply the understandings acquired in lab and lecture.

CHEM 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHEM 2120. Tropical Disease and Medicine. 4 Hours.
Studies the chemistry and chemotherapy of tropical diseases, or "infectious diseases of poverty," such as malaria, sleeping sickness, and Chagas disease, by conducting a survey of drugs developed to treat these diseases. Explores topics in drug discovery and development, mechanisms of drug action, factors affecting patient care in endemic countries, and recent developments in tropical diseases. Develops principles of organic chemistry, medicinal chemistry, and biochemistry as needed. Suitable for the student with an interest in global health who may not intend to pursue a career in the natural sciences. Students who do not meet course prerequisites may seek permission of instructor.
CHEM 2311. Organic Chemistry 1. 4 Hours.
Introduces nomenclature, preparation, properties, stereochemistry, and reactions of common organic compounds. Presents correlations between the structure of organic compounds and their physical and chemical properties, and mechanistic interpretation of organic reactions. Includes chemistry of hydrocarbons and their functional derivatives.

CHEM 2312. Lab for CHEM 2311. 1 Hour.
Accompanies CHEM 2311. Introduces basic laboratory techniques, such as distillation, crystallization, extraction, chromatography, characterization by physical methods, and measurement of optical rotation. These techniques serve as the foundation for the synthesis, purification, and characterization of products from microscale syntheses integrated with CHEM 2311.

CHEM 2313. Organic Chemistry 2. 4 Hours.
Continues CHEM 2311. Focuses on additional functional group chemistry including alcohols, ethers, carbonyl compounds, and amines, and also examines chemistry relevant to molecules of nature. Introduces spectroscopic methods for structural identification.

CHEM 2314. Lab for CHEM 2313. 1 Hour.
Accompanies CHEM 2313. Basic laboratory techniques from CHEM 2312 are applied to chemical reactions of alcohols, ethers, carbonyl compounds, carbohydrates, and amines. Introduces basic laboratory techniques including infrared (IR) spectroscopy and nuclear magnetic resonance (NMR) spectrometry as analytical methods for characterization of organic molecules.

CHEM 2315. Organic Chemistry 1 for Chemistry Majors. 4 Hours.
Reviews the basics of bonding and thermodynamics of organic compounds as well as conformational and stereochemical considerations. Presents the structure, nomenclature, and reactivity of hydrocarbons and their functional derivatives. Highlights key reaction mechanisms, providing an introduction to the methodology of organic synthesis.

CHEM 2316. Lab for CHEM 2315. 2 Hours.
Accompanies CHEM 2315. Introduces basic laboratory techniques, such as distillation, crystallization, extraction, chromatography, characterization by physical methods, and measurement of optical rotation. These techniques serve as the foundation for the synthesis, purification, and characterization of products from microscale syntheses integrated with CHEM 2315.

CHEM 2317. Organic Chemistry 2 for Chemistry Majors. 4 Hours.
Continues CHEM 2315. Introduces structural identification of organic compounds using contemporary spectroscopic methods. Surveys key synthetic methods based on the mechanistic approach and functional group chemistry and application of these methods to design new chemical processes and novel chemical entities. Emphasizes the chemistry of biomolecules, natural products, and medicinal agents. Offers students an opportunity to outline novel multistep synthetic pathways, design new compositions of matter in silico (e.g., pharmaceuticals, agrochemicals, polymers); in the associated laboratory, students may produce these new materials. Students are assigned individual and group projects to refine and demonstrate their creative outputs.

CHEM 2318. Lab for CHEM 2317. 2 Hours.
Accompanies CHEM 2317. Introduces basic laboratory techniques including infrared (IR) spectroscopy and nuclear magnetic resonance (NMR) spectrometry as analytical methods for characterization of organic molecules. These methods serve as the basis for characterization of products from microscale syntheses.

CHEM 2319. Recitation for CHEM 2311. 0 Hours.
Offers students opportunities to work interactively with instructors and other students to learn and apply the understandings acquired in lab and lecture.

CHEM 2320. Recitation for CHEM 2313. 0 Hours.
Offers students opportunities to work interactively with instructors and other students to learn and apply the understandings acquired in lab and lecture.

CHEM 2321. Analytical Chemistry. 4 Hours.
Introduces the principles and practices in the field of analytical chemistry. Focuses on development of a quantitative understanding of homogeneous and heterogeneous equilibria phenomena as applied to acid-base and complexometric titrations, rudimentary separations, optical spectroscopy, electrochemistry, and statistics.

CHEM 2322. Lab for CHEM 2321. 1 Hour.
Accompanies CHEM 2321. Lab experiments provide hands-on experience in the analytical methods introduced in CHEM 2321, specifically, silver chloride gravimetry, complexometric titrations, acid-base titrations, UV-vis spectroscopy, cyclic voltammetry, Karl Fischer coulometry, and modern chromatographic methods.

CHEM 2323. Recitation for CHEM 2315. 0 Hours.
Accompanies CHEM 2315 and CHEM 2316. Offers students an opportunity to work interactively with instructors and other students to learn and apply the knowledge acquired in lab and lecture.

CHEM 2325. Recitation for CHEM 2317. 0 Hours.
Accompanies CHEM 2317 and CHEM 2318. Offers students an opportunity to work interactively with instructors and other students to learn and apply the knowledge acquired in lab and lecture.

CHEM 2331. Bioanalytical Chemistry. 4 Hours.
Develops good critical thinking and problem-solving skills through the exploration of open-ended group projects in a laboratory-based course centered on the analytical chemistry of biomolecules. Develops an understanding of the practice and business aspects of analytical chemistry as they relate to research and development labs in the biotechnology/pharmaceutical industry.

CHEM 2332. Lab for CHEM 2331. 1 Hour.
Accompanies CHEM 2331. Working in teams, students investigate real-world, open-ended research problems in the field of bioanalytical chemistry, broadly defined using modern analytical instrumentation.

CHEM 2341. Forensic Chemistry 1. 3 Hours.
Provides students with insights into forensic science from a fundamental, chemical perspective. Explores the challenges and methodologies of forensic chemistry and addresses some misrepresentations of forensics by television dramas. Topics covered include drug analysis, arson investigation, questioned document analysis, serology, DNA evidence, fiber analyses, and weapon impressions.

CHEM 2342. Lab for CHEM 2341. 1 Hour.
Accompanies CHEM 2341. In the laboratory, a crime scene is staged. Students must determine what evidence is useful and what instrumentation to use. Instructional guidance is provided, but the methodologies are developed by the students, who need to rely on the lessons presented in lecture to “solve the case.” An important aspect of this process is for the students to learn details of evidence collection. Forensic samples are often contaminated and standard protocols are not always available. After a brief class discussion, students perform whatever experiments on the evidence they deem necessary to try to determine the events of the crime.
CHEM 2990. Elective. 1-4 Hours. Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHEM 3401. Chemical Thermodynamics and Kinetics. 4 Hours. Traces the development of chemical thermodynamics through the three major laws of thermodynamics. These are applied to thermochemistry, chemical reaction and phase equilibria, and the physical behavior of multicomponent systems. Emphasizes quantitative interpretation of physical measurements.

CHEM 3402. Lab for CHEM 3401. 1 Hour. Accompanies CHEM 3401. Demonstrates the measurement of selected physical chemical phenomena presented in CHEM 3401, introducing experimental protocol and methods of data analysis. Experiments include investigations of gas nonideality and critical phenomena, electrochemical measurement of equilibrium, construction of phase diagrams, and bomb and differential scanning calorimetry.

CHEM 3403. Quantum Chemistry and Spectroscopy. 4 Hours. Studies the theory of quantum chemistry with applications to spectroscopy. Presents some simple quantum mechanical (QM) models, including the particle in a box, rigid rotor, and harmonic oscillator, followed by treatments of electrons in atoms and molecules. Microwave, infrared, Raman, NMR, ESR, atomic absorption, atomic emission, and UV-Vis spectroscopy are discussed in detail.

CHEM 3404. Lab for CHEM 3403. 1 Hour. Accompanies CHEM 3403. Explores the principles covered in CHEM 3403 by laboratory experimentation. Experiments include measurement of reaction kinetics, such as excited state dynamics, measurement of gas transport properties, atomic and molecular absorption and emission spectroscopy, infrared spectroscopy of molecular vibrations, and selected applications of fluorimetry.

CHEM 3431. Physical Chemistry. 4 Hours. Offers an in-depth survey of physical chemistry. Emphasizes applications in modern research, including examples from biochemistry. Topics include the laws of thermodynamics and their molecular interpretation; equilibrium in chemical and biochemical systems; molecular transport; kinetics, including complex enzyme mechanisms; and an introduction to spectroscopy and the underlying concepts of quantum chemistry.

CHEM 3432. Lab for CHEM 3431. 1 Hour. Accompanies CHEM 3431. Covers practical skills in physical chemistry with an emphasis on current practice in chemistry, biochemistry, and pharmaceutical science. Introduces both ab initio and biological molecular modeling, differential scanning calorimetry, polymer characterization, protein unfolding and protein/ligand binding, electronic absorption spectroscopy, and synthesis of nanoparticles or quantum dots.

CHEM 3501. Inorganic Chemistry. 4 Hours. Presents the following topics: basic concepts of molecular topologies, coordination compounds, coordination chemistry, isomerism, electron-transfer reactions, substitution reactions, molecular rearrangements and reactions at ligands, and biochemical applications.

CHEM 3505. Introduction to Bioinorganic Chemistry. 4 Hours. Explores basic concepts of molecular topologies, coordination compounds, coordination chemistry, isomerism, electron-transfer reactions, substitution reactions, molecular rearrangements, and reactions at ligands in the context of metal-based drugs, imaging agents, and metalloenzymes.

CHEM 3506. Lab for CHEM 3505. 1 Hour. Offers a laboratory course in inorganic chemistry with experiments and projects that track with the topics discussed in CHEM 3505. Designed for students who have mastered basic laboratory techniques in general and organic chemistry. Introduces new synthetic techniques and applies modern analytical characterization tools not previously used in other laboratory courses (such as CHEM 3522 and CHEM 3532).

CHEM 3507. Recitation for CHEM 3505. 0 Hours. Offers students additional opportunities to work interactively with instructors and other students to learn and apply the concepts presented in CHEM 3505.

CHEM 3521. Instrumental Methods of Analysis. 1 Hour. Introduces the instrumental methods of analysis used in all fields of chemistry, with an emphasis on understanding not only the fundamental principles of each method but also the basics of the design and operation of the relevant instrumentation.

CHEM 3522. Instrumental Methods of Analysis Lab. 4 Hours. Accompanies CHEM 3521. Lab experiments provide hands-on experience in the instrumental methods of analysis discussed in CHEM 3521, such as high-performance liquid chromatography, gas chromatography, mass spectrometry, capillary electrophoresis, atomic absorption, cyclic voltammetry, and UV-vis spectroscopy.

CHEM 3531. Chemical Synthesis Characterization. 1 Hour. Introduces advanced techniques in chemical synthesis and characterization applicable to organic, inorganic, and organometallic compounds. Techniques used include working under inert atmosphere, working with liquefied gases, and handling moisture-sensitive reagents, NMR, IR, and UV-vis spectroscopy.

CHEM 3532. Chemical Synthesis Characterization Lab. 4 Hours. Accompanies CHEM 3531. Covers topics from the course through various experiments.

CHEM 3990. Elective. 1-4 Hours. Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHEM 4455. Organic Chemistry 3 Abroad. 4 Hours. Offers students majoring in chemistry an opportunity to apply the principles gained in two semesters of organic chemistry and chemical biology to a relevant disciplinary context. The discovery, design, and development of biologically active compounds for medical purposes uses knowledge and techniques gained in both organic synthesis and chemical biology. The course emphasizes how to direct those skills to incorporate specific chemical features into organic compounds to meet biological criteria. As such, offers students an opportunity to develop problem-solving skills that are valuable across a range of chemical disciplines and not confined to synthetic organic chemistry alone. Taught abroad.

CHEM 4456. Organic Chemistry 3: Organic Chemistry of Drug Design and Development. 4 Hours. Offers students majoring in chemistry an opportunity to apply the principles gained in two semesters of organic chemistry and chemical biology to a relevant disciplinary context. The discovery, design, and development of biologically active compounds for medical purposes uses knowledge and techniques gained in both organic synthesis and chemical biology. It directs those skills to incorporate specific chemical features into organic compounds to meet biological criteria. As such, it seeks to develop problem-solving skills that are valuable across a range of chemical disciplines and not confined to synthetic organic chemistry alone.
CHEM 4457. Lab for CHEM 4456. 1 Hour.
Accompanies CHEM 4456. Includes literature research activities, field trips, case studies, and presentations. Offers students an opportunity to prepare for a wider range of career options.

CHEM 4620. Introduction to Protein Chemistry. 4 Hours.
Introduces protein chemistry in the context of molecular medicine. Discusses analytical methods used to elucidate the origin, structure, function, and purification of proteins. Surveys the synthesis and chemical properties of structurally and functionally diverse proteins, including globular, membrane, and fibrous proteins. Discusses the role of intra- and intermolecular interactions in determining protein conformation, protein folding, and in their enzymatic activity. Intended for undergraduate students without prior experience in protein chemistry.

CHEM 4621. Introduction to Chemical Biology. 4 Hours.
Probes the structure and function of biological macromolecules and the chemical reactions carried out in living systems, including biological energetics. Discusses techniques to measure macromolecular interactions and the principles and forces governing such interactions. Offers students an opportunity to gain experience in reading and evaluating primary literature. Intended for undergraduate students with no prior knowledge of the field.

CHEM 4622. Lab for CHEM 4621. 1 Hour.
Accompanies CHEM 4621. Complements and reinforces the concepts from CHEM 4621 with an emphasis on fundamental techniques. Offers students an opportunity to complete independent projects in modern chemical biology research.

CHEM 4628. Introduction to Spectroscopy of Organic Compounds. 4 Hours.
Examines the application of modern spectroscopic techniques to the structural elucidation of small organic molecules. Emphasizes the use of H and C NMR spectroscopy supplemented with information from infrared spectroscopy and mass spectrometry. Explores both the practical and nonmathematical theoretical aspects of 1D and 2D NMR experiments. Topics include the chemical shift, coupling constants, the nuclear Overhauser effect and relaxation, and 2D homonuclear and heteronuclear correlation. Designed for chemists who do not have an extensive math or physics background; no prior knowledge of NMR spectroscopy is assumed.

CHEM 4629. Identification of Organic Compounds. 2 Hours.
Introduces the use of the nuclear magnetic resonance (NMR) spectrometer and basic NMR experiments. Determines the identity of unknown organic compounds by the use of mass spectrometry, infrared spectroscopy, and 1D and 2D nuclear magnetic resonance spectroscopy.

CHEM 4700. Topics in Organic Chemistry. 4 Hours.
Offers various topics within the breadth of organic chemistry. Intended to meet the needs and interests of students. Topics could range from the physical and material aspects of organic chemistry to the biochemical and biomedical aspects of organic chemistry. May be repeated once.

CHEM 4750. Senior Research. 4 Hours.
Conducts original experimental work under the direction of members of the department on a project. Introduces experimental design based on literature and a variety of techniques depending upon the individual project.

CHEM 4770. Chemistry Capstone. 4 Hours.
Integrates and assesses both curricular and experiential aspects of undergraduate chemical education. Requires written and oral presentations related to cooperative education or other experiential activities, and to the senior research project. Reporting on the research project requires extensive library and Internet research of background and scientific principles, and organization and interpretation of results. Includes class discussion and critiquing of materials presented.

CHEM 4901. Undergraduate Research. 4 Hours.
Conducts original research under the direction of members of the department. May be repeated without limit.

CHEM 4902. Undergraduate Research Abroad. 4 Hours.
Offers students an opportunity to conduct original research under the direction of members of the department. Students are assigned an independent research topic and are expected to produce original work outputs, which can include written reports, laboratory experiments, and technical presentations. Taught abroad.

CHEM 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

CHEM 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

CHEM 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHEM 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CHEM 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CHEM 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CHEM 4994. Internship. 4 Hours.
Offers students an opportunity for internship work. May be repeated without limit.

CHEM 4996. Experiential Education Directed Study. 4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using the course to fulfill their experiential education requirement. May be repeated without limit.

CHEM 5500. Introduction to Regulatory Science. 2 Hours.
Introduces the science that supports regulatory affairs in the biopharmaceutical industry. Focuses on the methods and instruments used to characterize the processes and products of biotechnology including the production, separation, purification, characterization, and formulation of biologics; the pharmacokinetics of proteins; chemical and biological equivalencies of biogenerics; stability testing; high throughput assays; cell system expression; variants; method validation; and quality control.
CHEM 5550. Introduction to Glycobiology and Glycoprotein Analysis. 3 Hours.
Covers the background and methods used for glycoprotein characterization. Offers students an opportunity to obtain the background needed to assess the analytical steps necessary for development of glycoprotein drugs. Analyzes regulatory issues behind glycoprotein drug development. Covers recent developments in analytical and regulatory sciences.

CHEM 5570. Regulatory Science Applications Laboratory. 4 Hours.
Offers a laboratory course providing hands-on experience with cell culture techniques and analytical instrumentation currently used in the biotechnology industry. Methods of analysis include enzyme-linked immunosorbent assay (ELISA), gel electrophoresis, high-performance liquid chromatography, and mass spectrometry coupled with commonly used techniques in sample preparation for protein analysis.

CHEM 5599. Introduction to Research Skills and Ethics in Chemistry. 0 Hours.
Seeks to prepare students for success in CHEM 5600. May be repeated once.

CHEM 5600. Research Skills and Ethics in Chemistry. 3 Hours.
Discusses ethics in science. Topics include documentation of work in your laboratory notebook, safety in a chemistry research laboratory, principles of experimental design, online computer searching to access chemical literature, reading and writing technical journal articles, preparation and delivery of an effective oral presentation, and preparation of a competitive research proposal.

CHEM 5610. Polymer Chemistry. 3 Hours.
Discusses the synthesis and analysis of polymer materials. Covers mechanisms and kinetics of condensation/chain-growth polymerization reactions and strategies leading to well-defined polymer architectures and compositions, including living polymerizations (free radical, cationic, anionic), catalytic approaches, and postpolymerization functionalization. Discusses correlation of chemical composition and structure to physical properties and applications.

CHEM 5611. Analytical Separations. 3 Hours.
Describes the theory and practice of separating the components of complex mixtures in the gas and liquid phase. Also includes methods to enhance separation efficiency and detection sensitivity. Covers thin-layer, gas, and high-performance liquid chromatography (HPLC) and recently developed techniques based on HPLC including capillary and membrane-based separation, and capillary electrophoresis.

CHEM 5612. Principles of Mass Spectrometry. 3 Hours.
Describes the theory and practice of ion separation in electrostatic and magnetic fields and their subsequent detection. Topics include basic principles of ion trajectories in electrostatic and magnetic fields, design and operation of inlet systems and electron impact ionization, and mass spectra of organic compounds.

CHEM 5613. Optical Methods of Analysis. 3 Hours.
Describes the application of optical spectroscopy to qualitative and quantitative analysis. Includes the principles and application of emission, absorption, scattering and fluorescence spectroscopies, spectrometer design, elementary optics, and modern detection technologies.

CHEM 5614. Electroanalytical Chemistry. 3 Hours.
Describes the theory of electrode processes and modern electroanalytical experiments. Topics include the nature of the electrode-solution interface (double layer models), mass transfer (diffusion, migration, and convection), types of electrodes, reference electrodes, junction potentials, kinetics of electrode reactions, controlled potential methods (cyclic voltammetry, chronoamperometry), chronocoulometry and square wave voltammetry, and controlled current methods (chronopotentiometry).

CHEM 5616. Protein Mass Spectrometry. 3 Hours.
Offers students an opportunity to obtain a fundamental understanding of modern mass spectrometers, the ability to operate these instruments, and the ability to prepare biological samples. Undoubtedly the most popular analytical method in science, mass spectrometry is utilized in fields ranging from subatomic physics to biology. Focuses on the analysis of proteins, with applications including biomarker discovery, tissue characterization, detection of blood doping, drug discovery, and the characterization of protein-based therapeutics. By the end of the course, the student is expected to be able to solve a particular chemistry- or biology-related problem by choosing the appropriate sample preparation methods and mass spectrometer.

CHEM 5617. Protein Mass Spectrometry Laboratory. 3 Hours.
Offers students an opportunity to develop an appreciation of the appropriate choice of mass spectrometer for a particular application.

CHEM 5620. Protein Chemistry. 3 Hours.
Describes proteins (what they are, where they come from, and how they work) in the context of analytical analysis and molecular medicine. Discusses the chemical properties of proteins, protein synthesis, and the genetic origins of globular proteins in solution, membrane proteins, and fibrous proteins. Covers the physical intra- and intermolecular interactions that proteins undergo along with descriptions of protein conformation and methods of structural determination. Explores protein folding as well as protein degradation and enzymatic activity. Highlights protein purification and biophysical characterization in relation to protein analysis, drug design, and optimization.

CHEM 5621. Principles of Chemical Biology for Chemists. 3 Hours.
Explores the use of natural and unnatural small-molecule chemical tools to probe macromolecules, including affinity labeling and click chemistry. Covers nucleic acid sequencing technologies and solid-phase synthesis of nucleic acids and peptides. Discusses in-vitro selection techniques, aptamers, and quantitative issues in library construction. Uses molecular visualization software tools to investigate structures of macromolecules. Intended for graduate and advanced undergraduate students.

CHEM 5622. Lab for CHEM 5621. 1 Hour.
Accompanies CHEM 5621. Complements and reinforces the concepts from CHEM 5621 with emphasis on fundamental techniques. Offers an opportunity to complete independent projects in modern chemical biology research.

CHEM 5625. Chemistry and Design of Protein Pharmaceuticals. 3 Hours.
Covers the chemical transformations and protein engineering approaches to protein pharmaceuticals. Describes protein posttranslational modifications, such as oxidation, glycosylation, formation of isoaspartic acid, and disulfide. Then discusses bioconjugate chemistry, including those involved in antibody-drug conjugate and PEGylation. Finally, explores various protein engineering approaches, such as quality by design (QbD), to optimize the stability, immunogenicity, activity, and production of protein pharmaceuticals. Discusses the underlying chemical principles and enzymatic mechanisms as well.

CHEM 5626. Organic Synthesis 1. 3 Hours.
Surveys types of organic reactions including stereochemistry, influence of structure and medium, mechanistic aspects, and synthetic applications.

CHEM 5627. Mechanistic and Physical Organic Chemistry. 3 Hours.
Surveys tools used for elucidating mechanisms including thermodynamics, kinetics, solvent and isotope effects, and structure/reactivity relationships. Topics include molecular orbital theory, aromaticity, and orbital symmetry. Studies reactive intermediates including carbenes, carbonium ions, radicals, biradicals and carbanions, acidity, and photochemistry.
CHEM 5628. Principles of Spectroscopy of Organic Compounds. 3 Hours.
Studies how to determine organic structure based on proton and carbon nuclear magnetic resonance spectra, with additional information from mass and infrared spectra and elemental analysis. Presents descriptive theory of nuclear magnetic resonance experiments and applications of advanced techniques to structure determination. Includes relaxation, nuclear Overhauser effect, polarization transfer, and correlation in various one- and two- dimensional experiments. Requires graduate students to have one year of organic chemistry or equivalent.

CHEM 5636. Statistical Thermodynamics. 3 Hours.
Briefly reviews classical thermodynamics before undertaking detailed coverage of statistical thermodynamics, including probability theory, the Boltzmann distribution, partition functions, ensembles, and statistically derived thermodynamic functions. Reconsiders the basic concepts of statistical thermodynamics from the modern viewpoint of information theory. Presents practical applications of the theory to problems of contemporary interest, including polymers and biopolymers, nanoscale systems, molecular modeling, and bioinformatics.

CHEM 5637. Foundations of Spectroscopy. 3 Hours.
Covers the fundamentals of quantum mechanics, with applications to spectroscopy of atoms, molecules, and proteins. Topics include introduction to quantum mechanics, mathematical tools, rigid rotor, microwave spectroscopy, harmonic oscillator, infrared and raman spectroscopy, hydrogen atom, emission spectra, electron spin, and applications to molecular and biological systems.

CHEM 5638. Molecular Modeling. 3 Hours.
Introduces molecular modeling methods that are basic tools in the study of macromolecules. Is structured partly as a practical laboratory using a popular molecular modeling suite, and also aims to elucidate the underlying physical principles upon which molecular mechanics is based. These principles are presented in supplemental lectures or in laboratory workshops.

CHEM 5639. Chemical Kinetics. 3 Hours.
Explores the use of experimental data to deduce the rate law of a reaction. Covers mechanisms deduced from rate laws, and the influence of experimental error on precision of rate constants and activation energies. Examines collision- and transition-state theories of reaction rates.

CHEM 5644. Principles and Analysis of Carbohydrates. 3 Hours.
Focuses on carbohydrates and their derivatives, which are important molecular and cellular building blocks and are of increasing significance as subunits of biopharmaceuticals including proteins and monoclonal antibodies. Surveys structural features and the chemical reactivity of simple through more complex carbohydrates and assesses contemporary methods of analysis. Highlights glycosylated biopharmaceuticals, including antibody and glycoprotein therapeutics, together with a study of glycosylation pathways in the posttranslational modification of gene products.

CHEM 5645. Drug Discovery and Development. 3 Hours.
Designed to provide a broad overview of the drug discovery and development processes involved in the identification and commercialization of new chemical entities (NCEs). Topics include target validation, high throughput screening, route selection, process chemistry, manufacturing under GMP/GLP conditions, preclinical and clinical analysis, and formulation chemistry.

CHEM 5646. Synthesis and Reactivity of Inorganic Compounds. 3 Hours.
Offers an advanced undergraduate/introductory graduate course in inorganic chemistry. Topics include an introduction to solid-state structures and the origin of color in inorganic compounds. Describes the synthesis, reactivity, and bonding of transition metal coordination compounds along with applications in health-related fields.

CHEM 5647. Bioinorganic Chemistry. 3 Hours.
Explores coordination chemistry, electron-transfer reactions, substitution reactions, molecular rearrangements, and reactions at ligands in coordination compounds, imaging agents, and metalloenzymes.

CHEM 5651. Materials Chemistry of Renewable Energy. 3 Hours.
Studies renewable energy in terms of photovoltaics, photoelectrochemistry, fuel cells, batteries, and capacitors. Focuses on the aspects of each component and their relationships to one another.

CHEM 5652. Fundamental Science of Photovoltaics. 3 Hours.
Covers the basics of photovoltaic energy conversion. Emphasizes the underlying challenge in the chemistry of materials required to effect direct conversion of solar energy into electricity. Also emphasizes artificial photosynthesis and how to leverage photosynthesis in the quest for new materials. Includes graduate-level discussion of different generations of the solar cell, from silicon-based, organic, polymer, and dye-sensitized to the quantum-dot-hybrid biosolar cell. Lectures cover solid-state chemistry and physics of photovoltaics, p-n junctions, Fermi level, flat bands, charge, field, photo current, quantum dots, solar spectrum, atmospheric attenuation, geometric effects, Shockley-Queisser limit on efficiency of solar cells, Schottky barriers, and future directions toward a green biosolar cell. Open to students with junior or senior standing.

CHEM 5660. Analytical Biochemistry. 3 Hours.
Focuses on the analysis of biological molecules, which include nucleic acids, proteins, carbohydrates, lipids, and metabolites. Methods used for isolation, purification, and characterization of these molecules are discussed.

CHEM 5668. Principles of Radiochemistry. 3 Hours.
Introduces the properties, production, and labeling methods associated with radionuclides used in radiotracer development. Covers general radiochemical principles, emphasizing radiohalogens and radionuclides. Reviews specific issues associated with particular classes of nuclides, such as decay properties, half-life, production and isolation, methods for incorporation, and detection methods.

CHEM 5669. Environmental Analytical Chemistry. 3 Hours.
Describes the application of instrumental methods for analyzing environmental samples for major, minor, and trace components of toxicological concern. Topics include sampling strategies for natural systems; determination of trace metals in natural waters and biologicals; determination of xenobiotics by GC, LC, GC-MS, and LC-MS; remote sensing of atmospheric pollutants; and molecular biomarkers and detection of protein and DNA adducts.

CHEM 5672. Organic Synthesis 2. 3 Hours.
Continues CHEM 5626. Surveys types of organic reactions including stereochemistry, influence of structure and medium, mechanistic aspects, and synthetic applications.

CHEM 5676. Bioorganic Chemistry. 3 Hours.
Covers host guest complexation by crown ethers, cryptands, podands, spherands, and so forth; molecular recognition including self-replication; peptide and protein structure; coenzymes and metals in bioorganic chemistry; nucleic acid structure; interaction of DNA with proteins and small molecules including DNA-targeted drug design; catalytic RNA; and catalytic antibodies.
CHEM 5678. Design and Synthesis of Radiotracers for Biological Targets. 3 Hours.
Studies and evaluates the process for developing noninvasive, biological probes, including design and synthesis. Uses case studies to explore how radiotracers are employed to study specific biological problems. Discusses the context of the biological system for each problem. Evaluates criteria related to radionuclide properties, biochemical readout, and chemical synthesis. Examples cover major radionuclide families and biological targets. CHEM 5668 recommended.

CHEM 5686. Fundamentals of Molecular Structure and Electronics. 3 Hours.
Studies many-electron atoms, simple diatomic molecules, conjugated pi-electron systems, the electronic structure of molecules, molecular modeling, and modeling of proteins and biological systems.

CHEM 5687. Principles of Solid State Chemistry. 3 Hours.
Overviews solid-state materials from a chemistry perspective. Specific perspectives are those of classification, characterization, and structure-property relationships, and synthesis and design of tailor-made materials to meet future technological needs. Includes relevant theory and practice of spectroscopic methods as well as concepts of physics involved with structure-property relationships.

CHEM 5688. Principles of Magnetic Resonance. 3 Hours.
Presents the physical principles underlying magnetic resonance spectroscopy including Fourier transform theory, classical and quantum-mechanical treatments of spin angular momentum, the Bloch equations, spin relaxation, and density matrix formalism applied to chemical and molecular dynamics. Introduces different magnetic resonance methods, with emphasis on time-domain NMR methods such as phase cycling, 2D spectroscopy, and selective pulse sequences. A special topic may include magnetic resonance imaging (MRI), solid-state NMR (CP-MAS), or macromolecular structure.

CHEM 5696. Organometallic Chemistry. 3 Hours.
Offers an advanced graduate-level course in organometallic chemistry of the transition metals. Requires an advanced undergraduate or introductory graduate course in inorganic chemistry. It is assumed that students have a good working background in NMR spectroscopy and its application to the identification of organic compounds. Addresses the structure, bonding, and reactivity patterns of transition metal organometallic complexes, with applications to organic synthesis. Topics include metal carbonyls, metal pi-complexes, insertion and elimination reactions, and catalysis using transition metal organometallic compounds.

CHEM 5698. Physical Methods in Chemistry. 3 Hours.
Introduces resonance spectroscopy, electronic absorption spectroscopy, electronic states and structure, and NMR spectroscopy. Concentrates on interpretation and origin of resonance of inorganic nuclei, that is, 31P, 11B not proton; fluxionality, and EPR. Discusses interpretation of ESR spectra with respect to the structure of inorganic compounds and magnetic measurements.

CHEM 5700. Topics in Organic Chemistry. 3 Hours.
Offers various topics within the breadth of organic chemistry. Intended to meet the needs and interests of students. Topics could range from the physical and material aspects of organic chemistry to the biochemical and biomedical aspects of organic chemistry. Undergraduate students who have completed a second semester of organic chemistry with a grade of at least C– may be admitted with permission of instructor. May be repeated once.

CHEM 5904. Seminar. 1 Hour.
Focuses on oral reports by master of science and PlusOne participants on current research topics in chemistry and chemical biology. May be repeated up to two times.

CHEM 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CHEM 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CHEM 5984. Research. 1-6 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated up to three times for up to 6 total credits.

CHEM 6900. Exam Preparation—Master’s. 0 Hours.
Provides eligible students with an opportunity to take the master’s qualifying exam under faculty supervision.

CHEM 7247. Advances in Nanomaterials. 3 Hours.
Designed to provide an entry-level perspective of solid-state chemistry both from a fundamental and applied perspective. Discusses the basic aspects of materials science encompassing broad areas of structure, physical properties, and classification in the context of both bulk and surface (thin films, interfaces) properties.

CHEM 7250. Chemical Bioenergetics: Applications in Biomaterials Design. 3 Hours.
Covers principles of energy transduction in biological systems and biomolecules with an emphasis on the application of such processes in the design of a novel class of biologically functionalized energetic materials. Topics include electron transport, chemical energy, electrochemistry, resonant energy transfer, photoinitiated charge transfer, and thermal stability in biological systems, and the assembly of biofunctionalized materials. Discusses the application of these principles to the development of nanomotors, biofuel cells, biosolar cells, and self-assembling systems on the nanoscale. Requires one year of undergraduate physical chemistry with lab.

CHEM 7301. Special Topics in Analytical Chemistry. 3 Hours.
Presents selected topics of current importance in analytical chemistry. May be repeated without limit.

CHEM 7305. Special Topics in Inorganic and Materials Chemistry. 3 Hours.
Presents selected topics of current importance in inorganic and materials chemistry. May be repeated without limit.

CHEM 7310. Special Topics in Organic Chemistry. 3 Hours.
Presents selected topics of current importance in organic chemistry. May be repeated without limit.
CHEM 7317. Analytical Biotechnology. 3 Hours.
Focuses on the analytical methods used for the characterization of recombinant DNA-derived proteins for human therapeutic use. Combines the description of advanced analytical methods, in particular HPLC and mass spectrometry, with protein chemistry. An important aspect is the development of a method that can identify protein modifications that are present in a product as a result of biosynthetic modifications, contaminants, or degradative reactions. Provides an integrative overview of the role of analytical methods at the different stages of development and production of protein therapeutics including upstream (cell line development, cell culture), downstream (recovery and purifications), formulation development, stability studies, and clinical assay.

CHEM 7320. Special Topics in Physical Chemistry. 3 Hours.
Studies advanced topics of importance in physical chemistry including quantum chemistry. May be repeated without limit.

CHEM 7730. Advanced Laboratory Methods. 4 Hours.
Seeks to provide intensive practical laboratory training in a chosen thematic area. Students select from organic and medicinal chemistry, physical and materials chemistry, or analytical and biological chemistry. The course involves a common practical training module followed by specialized modules in the chosen concentration area. The practical training features a combination of formal laboratory instruction coupled with rotation through selected research laboratories. Full-time PhD students only.

CHEM 7750. Advanced Problem Solving. 3 Hours.
Designed to provide skills necessary to lead advanced problem-solving case studies. Faculty mentors in one of three thematic areas chosen from organic and medicinal chemistry, physical and materials chemistry, or analytical and biological chemistry. The course involves a common practical training module followed by specialized modules in the chosen concentration area. The practical training features a combination of formal laboratory instruction coupled with rotation through selected research laboratories. Full-time PhD students only.

CHEM 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHEM 7976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

CHEM 7978. Independent Study. 1-4 Hours.
Offers theoretical or experimental work under individual faculty supervision. May be repeated without limit.

CHEM 7990. Thesis. 1-4 Hours.
Offers thesis supervision by members of the department. May be repeated without limit.

CHEM 7996. Thesis Continuation. 0 Hours.
Offers continuing thesis supervision by members of the department.

CHEM 8500. Analytical Seminar. 1 Hour.
Focuses on oral reports by the participants on current investigations in analytical chemistry. Must be enrolled in full-time program. May be repeated without limit.

CHEM 8501. Inorganic Seminar. 1 Hour.
Focuses on oral reports by the participants on current investigations in inorganic chemistry. Must be enrolled in full-time program. May be repeated without limit.

CHEM 8502. Organic Seminar. 1 Hour.
Focuses on oral reports by the participants on current investigations in organic chemistry. Must be enrolled in full-time program. May be repeated without limit.

CHEM 8503. Physical Chemistry Seminar. 1 Hour.
Focuses on oral reports by the participants on current investigations in physical chemistry. Must be enrolled in full-time program. May be repeated without limit.

CHEM 8504. Graduate Seminar. 1 Hour.
Focuses on oral reports by the participants on current research topics in chemistry and chemical biology. May be repeated without limit.

CHEM 8505. Directed Laboratory Research. 4 Hours.
Involves faculty-guided studies that are not directly related to research pursued for thesis or dissertation. Nonthesis students only.

CHEM 8506. Directed Literature Research. 4 Hours.
Focuses on extensive research of the primary literature under direction of a graduate faculty member, leading to a comprehensive written review of a significant chemical problem and an oral examination. Nonthesis students only.

CHEM 8960. Exam Preparation—Doctoral. 0 Hours.
Offers the student the opportunity to prepare for and take the PhD qualifying exams (cumulative exams).

CHEM 8966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

CHEM 8982. Readings. 1-4 Hours.
Offers selected readings under the supervision of a faculty member. May be repeated without limit.

CHEM 8984. Research. 1-6 Hours.
Offers the chance to conduct original research, written thesis thereon, or to the establishment of doctoral candidacy. May be repeated without limit.

CHEM 8986. Research. 0 Hours.
Offers the student the opportunity to conduct full-time research for the master’s degree. May be repeated without limit.

CHEM 9000. PhD Candidacy Achieved. 0 Hours.
Indicates successful completion of the doctoral comprehensive exam.

CHEM 9860. Doctoral Research. 0 Hours.
Offers the opportunity to complete in-depth original research, representing a significant contribution of new chemical knowledge and a written dissertation thereon, under the supervision of a faculty member. May be repeated without limit.

CHEM 9986. Research. 0 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CHEM 9986. Research. 0 Hours.
Offers the student the opportunity to conduct full-time research for the PhD. May be repeated without limit.

CHEM 9990. Dissertation. 0 Hours.
Offers the student the opportunity to conduct theoretical and experimental research for the PhD degree. Open to chemical biology students. May be repeated once.

CHEM 9996. Dissertation Continuation. 0 Hours.
Offers dissertation supervision by members of the department. Open to chemical biology students. May be repeated without limit.
CHNS 1101. Elementary Chinese 1. 4 Hours.
Designed for students who have very little or no prior knowledge of Chinese. Provides a lively introduction to basic oral expression, listening comprehension, and elementary reading and writing. The audio-lingual approach, using practical vocabulary drawn from realistic situations, aims at good pronunciation and ease in response. Each lesson incorporates helpful information about daily life in China and the varied cultures within the world of Chinese speakers. Laboratory practice complements class work, enables students to work aloud at their own speed, reinforces their acquisition of essential structures, and acquaints them with a vast library of audio-visual resources. Focuses on Mandarin Chinese; students who wish to speak another dialect of Chinese should consult instructor for proper placement.

CHNS 1102. Elementary Chinese 2. 4 Hours.
Continues CHNS 1101. Reviews and continues the study of grammar and basic language skills. Offers progressively more intensive practice in oral and written communication. Laboratory practice complements class work, enables students to work aloud at their own speed, reinforces their acquisition of essential structures, and acquaints them with a vast library of audio-visual resources.

CHNS 1201. Elementary Chinese 1—BSIB. 4 Hours.
Description to come.

CHNS 1202. Elementary Chinese 2—BSIB. 4 Hours.
Description to come.

CHNS 1301. Elementary Chinese Immersion 1. 4 Hours.
Designed for students who are in a Chinese-speaking country, this is an off-campus immersion course. Focuses on standard Chinese. Offers students an opportunity to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

CHNS 1302. Elementary Chinese Immersion 2. 4 Hours.
Designed for students who are in a Chinese-speaking country, this is an off-campus immersion course. Focuses on standard Chinese. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

CHNS 1501. Elementary Chinese 1 for Heritage Speakers. 4 Hours.
Designed for those who are skilled in spoken Chinese as a heritage language but have yet to learn basic Chinese reading and writing. Focuses on reading, writing, and grammar, along with improvement of oral communication skills. Covers some 370 basic Chinese characters. Also introduces Chinese phonetics, pinyin, as well as the structure of Chinese characters.

CHNS 1502. Elementary Chinese 2 for Heritage Speakers. 4 Hours.
Designed for those students who have finished CHNS 1501 or equivalent and who have learned basic Chinese reading and writing techniques. Seeks to help them to move on a fast track beyond the beginner level to the intermediate university level. Strongly focuses on Chinese reading and writing skills, with more sophisticated sentences and paragraphs. Offers students an opportunity to develop writing skills to a functional literacy level, allowing them to carry out a number of practical writing tasks. Also aims to prepare students for CHNS 2102. Students who do not meet course prerequisites may seek permission of instructor.

CHNS 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHNS 2101. Intermediate Chinese 1. 4 Hours.
Emphasizes further vocabulary building and mastery of fine points of grammar through written composition, prepared oral reports, and reading and discussion from current Chinese periodicals. Allows students to engage actively in communication within various contexts and reviews the more subtle problems of grammar and writing style. This communicative class is for intermediate or advanced learners. It is especially suitable for Asian-American students who have some knowledge of certain Chinese dialects (that is, Cantonese and a level of language competence equal to two semesters of college Chinese) and want to learn Mandarin Chinese through reading, writing, and discussion.

CHNS 2102. Intermediate Chinese 2. 4 Hours.
Continues CHNS 2101. Emphasizes further vocabulary building and mastery of fine points of grammar through written composition, prepared oral reports, and reading and discussion from current Chinese periodicals.

CHNS 2151. Intermediate Chinese for Business Purposes. 4 Hours.
Emphasizes communicating in a business environment, tailoring grammar and sentence pattern coverage, vocabulary, and cultural topics to a business setting. Combines contemporary business topics and intermediate business Chinese. Offers students an opportunity to be prepared to communicate in speaking and writing in a business setting in China and with a better understanding of the current business culture in China. Students who do not meet course prerequisites may seek permission of instructor.

CHNS 2201. Intermediate Chinese 1—BSIB. 4 Hours.
Designed to meet the special needs of international business students. Builds on CHNS 1202. Offers students an opportunity to continue building vocabulary and mastery of fine points of grammar through written composition, prepared oral reports, and reading and discussion based on assigned material. International business majors only.

CHNS 2202. Intermediate Chinese 2—BSIB. 4 Hours.
Designed to meet the special needs of international business students. Builds on CHNS 2201. Offers students an opportunity to continue building vocabulary and mastery of fine points of grammar through written composition, prepared oral reports, and reading and discussion based on assigned material. International business majors only.

CHNS 2301. Intermediate Chinese Immersion 1. 4 Hours.
Designed for students who are in a Chinese-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

CHNS 2302. Intermediate Chinese Immersion 2. 4 Hours.
Designed for students who are in a Chinese-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

CHNS 2900. Specialized Instruction in Chinese. 1-4 Hours.
Designed for individuals whose language skills are at the intermediate level and who seek specially focused language instruction. Such instruction might be the use of the language in specific settings, or it might be focused on specific conversational nuances of the language. Students must have at least an elementary level of competence in the language. May be repeated without limit.

CHNS 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
CHNS 3101. Advanced Chinese 1. 4 Hours.
Stresses the fundamentals of Chinese to promote effective self-expression through speaking and writing and to explore the idiomatic aspects of the language. Through progressive class discussions and oral and written commentaries, students analyze a contemporary Chinese novel or a Chinese cultural reader, screenplay, or collection of short stories. The course strives, first, to help students read and comprehend modern Chinese writing with confidence and to be able to talk and write about it in good Chinese; and second, to provide preparation for advanced courses.

CHNS 3102. Advanced Chinese 2. 4 Hours.
Continues CHNS 3101. Enhances and reinforces those practical language and communication skills students encounter when they are abroad.

CHNS 3201. Advanced Chinese 1—BSIB. 4 Hours.
Designed to meet the special needs of international business students. Builds on CHNS 2202. Offers students an opportunity to continue building vocabulary and master fine points of grammar through written composition, prepared oral reports, and reading and discussion based on assigned material. International business majors only.

CHNS 3202. Advanced Chinese 2—BSIB. 4 Hours.
Designed to meet the special needs of international business students. Builds on CHNS 3201. Offers students an opportunity to continue building vocabulary and master fine points of grammar through written composition, prepared oral reports, and reading and discussion based on assigned material. International business majors only.

CHNS 3301. Advanced Chinese Immersion 1. 4 Hours.
Designed for students who are in a Chinese-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence.

CHNS 3302. Advanced Chinese Immersion 2. 4 Hours.
Designed for students who are in a Chinese-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence.

CHNS 3800. Special Topics in Chinese. 1-4 Hours.
Focuses on a unique aspect of the Chinese language. The specific topics are chosen to reflect current developments in the language and expressed student interests. Focuses on the use of the language for specific purposes or its use in specialized settings (e.g., media, business, health). Requires at least an intermediate level of skill in the language. May be repeated up to three times.

CHNS 3900. Specialized Instruction in Chinese. 1-4 Hours.
Designed for individuals whose language skills are at an advanced level and who seek specially focused language instruction. Such instruction might be the use of the language in specific settings, or it might be focused on specific conversational nuances of the language. Requires at least an advanced level of competence in the language. May be repeated without limit.

CHNS 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHNS 4101. Advanced Proficiency Chinese 1. 4 Hours.
Designed mainly for students of Chinese as a foreign language at a high intermediate or beginning advanced level of proficiency as designated by the American Council on Teaching of Foreign Languages (ACTFL) standards (or third-year Chinese language at universities). Seeks to help students perform more informal and formal language tasks with ease, confidence, and competence. Also seeks to strengthen understanding of contemporary Chinese culture and social environment, such as changing social values and contemporary popular culture. Offers students an opportunity to develop advanced language skills through integrated activities in listening, speaking, reading, and writing and to express complicated and abstract ideas. Students who do not meet course prerequisites may seek permission of instructor.

CHNS 4102. Advanced Proficiency Chinese 2. 4 Hours.
Builds upon the skills developed in previous Chinese courses. Seeks to enable students to accurately communicate detailed narratives and opinions in both spoken and written form. Offers students an opportunity to learn to provide structured arguments to support their opinions, to correctly use quantifiers and hypotheticals, and to develop good control of a full range of grammatical structures and a fairly wide general vocabulary. Students who do not meet course prerequisites may seek permission of instructor.

CHNS 4201. Advanced Proficiency Chinese 1—BSIB. 4 Hours.
Designed to meet the special needs of international business students. Builds on CHNS 3202. Offers students an opportunity to continue building vocabulary and master fine points of grammar through written composition, prepared oral reports, and reading and discussion based on assigned material. International business majors only.

CHNS 4202. Advanced Proficiency Chinese 2—BSIB. 4 Hours.
Designed to meet the special needs of international business students. Builds on CHNS 4201. Offers students an opportunity to continue to build vocabulary and master fine points of grammar through written composition, prepared oral reports, and reading and discussion based on assigned material. International business majors only.

CHNS 4800. Special Topics in Chinese. 1-4 Hours.
Focuses on a unique aspect of the Chinese language. The specific topics are chosen to reflect current developments in the language and expressed student interests. Topics focus on the use of the language for specific purposes or its use in specialized settings (e.g., media, business, health). Requires at least an advanced level of skill in the language. May be repeated up to four times.

CHNS 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CHNS 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CHNS 4992. Directed Study. 1-4 Hours.
Offers students a way of going beyond work given in the regular curriculum; may also enable students to complete major or minor requirements in certain situations. Priority is given to language majors and to juniors and seniors. May be repeated without limit.

CHNS 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated up to three times.

CHNS 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.
CHNS 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CHNS 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

Civil and Environmental Engineering (CIVE)

CIVE 1200. How Cities Work: Experiencing Urban Infrastructure. 4 Hours.
Introduces the principles of fluid mechanics and the applications in basic hydraulic engineering systems. Topics include properties of fluids; pressure and force on surfaces and submerged bodies; continuity, momentum, and energy conservation principles; dimensional analysis and hydraulic similitude; flow in closed conduits; steady flow in pipe networks; unsteady flow in pipes; flow in open channels; hydraulic machines; and hydraulic structures. The laboratory component includes demonstrations and experiments to show the applicability of fluid mechanics and hydraulics principles.

CIVE 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CIVE 2000. Introduction to Engineering Co-op Education. 1 Hour.
Provides students preparation for the first co-op experience. Focuses on skills that provide a basis for successful co-op engagement including expectations and requirements, an introduction to professional credentials, resume and goal setting, interviewing, professional and co-op ethics, issues of diversity in the workplace community, academic planning and decision making, and an introduction to career portfolios.

CIVE 2221. Statics and Strength of Materials. 4 Hours.
Introduces solid mechanics including properties of areas and volumes (centroidal axes, moments of inertia, and so on), equilibrium of particles and rigid bodies in two and three dimensions, analysis of internal forces in trusses and simple frames, stress and moment diagrams in beams, computation of stresses induced by moment, shear and torque, and mechanical properties of materials.

CIVE 2222. Recitation for CIVE 2221. 0 Hours.
Accompanies CIVE 2221. Covers problem solving and topics related to the course.

CIVE 2260. Civil Engineering Materials. 4 Hours.
Introduces the physical, mechanical, and chemical properties of materials of importance to civil engineers. Offers an overview of the ways in which these properties affect the material selection process, material behavior, and the design process.

CIVE 2261. Materials and Measurements Lab. 1 Hour.
Involves the use of standard lab test methods and equipment to determine properties of materials common to civil engineering practice. Also introduces students to land surveying, site layout, and the measurement of distance, elevation, and direction.

CIVE 2320. Structural Analysis 1. 4 Hours.
Covers shear stresses in beams, combined stress analysis (bars with axial load plus shear and bending), introduction to buckling, influence lines (application to statically determinate systems), computation of deflections (statically determinate systems), and analysis of indeterminate structures using the flexibility method and moment distribution.

CIVE 2321. Recitation for CIVE 2320. 0 Hours.
Accompanies CIVE 2320. Covers problem solving and topics related to the course.

CIVE 2324. Reinforced Concrete Design. 4 Hours.
Covers design of common reinforced concrete structural elements. Explores mechanical properties of steel and concrete. Examines behavior and design of reinforced concrete beams, one-way slab systems, footings, and short columns based on latest ACI-318 code.

CIVE 2331. Fluid Mechanics. 4 Hours.
Introduces the principles of fluid mechanics and the applications in basic hydraulic engineering systems. Topics include properties of fluids; pressure and force on surfaces and submerged bodies; continuity, momentum, and energy conservation principles; dimensional analysis and hydraulic similitude; flow in closed conduits; steady flow in pipe networks; unsteady flow in pipes; flow in open channels; hydraulic machines; and hydraulic structures. The laboratory component includes demonstrations and experiments to show the applicability of fluid mechanics and hydraulics principles.

CIVE 2334. Environmental Engineering 1. 4 Hours.
Focuses on protection and management of the environment. Topics include assessment of environmental quality; introduction to water and wastewater treatment technologies; air pollution control; and solid waste management.

CIVE 2335. Environmental Engineering Chemistry. 4 Hours.
Covers chemistry principles required for describing chemical processing of elements in natural systems, the distribution of pollutants in the environment, and chemical use in engineered treatment systems. Focuses on equilibrium thermodynamics and equilibria for acid-base, gas-water, precipitation-dissolution, metal complexation, oxidation-reduction, and sorption reactions. Discusses specific applications to pollutant reactions in surface waters, ground waters, soils, drinking water treatment, wastewater treatment, and the atmosphere.

CIVE 2340. Soil Mechanics. 4 Hours.
Studies soil classification, soil-water phase relations, water in soil, seepage, consolidation theory, and strength properties of soils.

CIVE 2341. Lab for CIVE 2340. 1 Hour.
Accompanies CIVE 2340. Introduces standard laboratory procedures for characterizing the physical, hydraulic, and mechanical properties of soils as well as data reduction and analysis methods for various test methods. Laboratory methods and determinations include moisture content, Atterberg limits, permeability, compaction, consolidation, and direct shear. Includes the use of computer-based data acquisition systems and measurement transducers.

CIVE 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
CIVE 3000. Professional Issues in Engineering. 1 Hour.
Provides students with an opportunity to reflect on both academic and co-op experiences in the context of planning for the senior year and beyond. Issues include professional and ethical issues, resolving ethical conflicts, awareness of engineers as professionals in a diverse world, strengthening decision-making skills, career portfolios, and lifelong learning needs, goals, and strategies. Students reflect upon issues of diversity from their experience in the University and in their cooperative education placements. Explores the role of different work and learning styles and diverse personal characteristics on the workplace and the classroom. Professional issues include impact of the cultural context, both in the United States and around the world, on the client, government relations, and workplace.

CIVE 3425. Steel Design. 4 Hours.
Concentrates on design of steel members subject to tension, compression, bending, and combinations of loading, and design of connections, braced frames, and rigid frames. Design is based on the latest load resistance factor specifications of the American Institute for Steel Construction code. The theoretical basis of code formulas is also emphasized.

CIVE 3430. Engineering Microbiology and Ecology. 4 Hours.
Introduces the importance of microorganisms and plants to the natural and built environments, including global biogeochemical cycles, ecosystem composition and stability, and engineering applications. Seeks to provide a fundamental understanding of microorganisms (metabolisms, growth, genetics, resource requirements, and niche) and their role in the global ecosystem (element cycling, energy flows, food webs). Examines the role of plant microbes in both engineered and nature systems for beneficial environmental applications and bidirectional interactions between the natural and the built environment through a series of case studies that highlight the challenges of and strategies for engineering in the earth system context, such as microbially mediated infrastructure corrosion, ecological effects of nutrient pollution, bioaccumulation, green infrastructure and remediation (constructed wetlands, bioremediation), and wastewater treatment.

CIVE 3435. Environmental Pollution Fate and Transport. 4 Hours.
Provides a systematic approach to analyzing the fate and transport of pollutants within natural systems. Equilibrium modeling and reactive transport modeling are used to assess the predominant processes that control the movement and persistence of pollutants in water, soil, and air. Topics include mass transfer across multiple phases; physical, chemical, and biological transformations of substances; transport processes (diffusion, dispersion, advection, interphase mass transport); eutrophication of lakes; conventional pollutants in rivers and estuaries; groundwater contamination; and atmospheric deposition.

CIVE 3464. Probability and Engineering Economy for Civil Engineering. 4 Hours.
Introduces engineering probability and statistics, as well as engineering economic analysis for project or design evaluation. Case studies are used to illustrate the integration of these areas in the design/system analysis process. Topics in engineering probability and statistics include descriptive statistics, expected value of random variables, and hypotheses testing. Statistical process control and sampling methods are introduced. Reliability methods for the analysis and improvement of system/design performance are discussed. Also covers fundamental concepts of time value of money and economic evaluation of alternatives, including the effects of depreciation and taxes.

CIVE 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CIVE 4534. Environmental Engineering 2. 3 Hours.
Continues CIVE 2334. Concentrates on unit operations, unit processes, and related fundamental design of physical, chemical, and biological water and wastewater treatment systems, using both lectures and laboratory instruction. Topics include aeration systems, activated sludge, fixed-film biological treatment, gas transfer, reaction kinetics, reactor modeling, coagulation, flocculation, sedimentation, filtration, and subsurface disposal system design.

CIVE 4535. Lab for CIVE 4534. 1 Hour.
Accompanies CIVE 4534. Covers topics from the course through various experiments.

CIVE 4540. Resource Recovery and Waste Treatment Technologies Abroad. 4 Hours.
Examines different aspects relative to municipal and industrial solid waste, with a special focus on material recovery. Covers chemical-physical characterization of waste, source reduction and toxicity, recycling and selection of different fractions, resource and energy recovery (e.g., composting, anaerobic digestion, combustion to energy), and analysis and preliminary design of treatment disposal options. Through design projects, offers students an opportunity to apply lessons learned to the U.S. context. Taught in a study-abroad format in a European nation.

CIVE 4541. Waste Management and Policy Abroad. 4 Hours.
Explores how the country visited manages the recovery and treatment of both industrial and municipal solid waste. Emphasizes waste generated in mining and other industrial activities (e.g., refinery, military). Examines multifaceted aspects, including governance; science/engineering; and health, social, and policy. Offers students an opportunity to interact with local experts and to visit key sights. Encourages students to think about possible policy lessons for the United States. Taught abroad.

CIVE 4542. Foundation Engineering. 4 Hours.
Explores soil-bearing capacity determination, design of shallow foundations and pile foundations, and design of retaining walls and excavation support systems.

CIVE 4554. Highway Engineering. 4 Hours.
Concentrates on highway design including route selection, geometric design, foundation and pavement design, drainage design, and construction issues. Analyzes highway traffic including traffic flow fundamentals and capacity and level of service analysis for freeways and rural highways. Covers the environmental impact and public review process for highway construction. Includes project component.

CIVE 4566. Design for Sustainable Transportation: Netherlands. 4 Hours.
Examines how the design of Dutch transportation infrastructure promotes travel by foot, bicycle, and public transportation as opposed to private automobile and how it promotes urban livability and traffic safety. Topics include bicycling infrastructure planning and design; Vision Zero traffic safety principles and design treatments for safe roads, intersections, and crossings; and high-quality transit service planning and design. Through design projects, offers students an opportunity to apply lessons learned to the U.S. context. Taught in a study-abroad format in the Netherlands.
CIVE 4567. Planning and Policy for Sustainable Urban Transportation: Netherlands. 4 Hours.
Examines urban transportation planning practices and policies in the Netherlands that promote travel by bicycling, public transportation, and foot and help prevent urban mobility from degrading urban livability. Topics include land-use planning at the site, neighborhood, and regional scale; transit- and bicycle-oriented development, including both land-use and transportation infrastructure planning and policies for large-scale urban expansions; and traffic-circulation planning and policies to promote safety, prevent roads from becoming barriers to walking, cycling, or transit, and to create car-free and car-lite zones. Taught in study-abroad format in the Netherlands.

CIVE 4575. Construction Management. 3 Hours.
Surveys the construction industry and tasks that must be addressed by construction management including resource allocation, construction environment, organization, contracts, funding, cash flow, productivity, conceptual and detailed cost estimating, labor relations, network planning and scheduling, construction accounting, and project control.

CIVE 4699. Special Topics in Civil Engineering. 4 Hours.
Covers special topics in civil engineering initiated by the appropriate discipline committee and approved by the department. May be repeated without limit.

CIVE 4700. Civil Engineering Research. 4 Hours.
Offers independent work for students in the University Honors Program under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CIVE 4765. Senior Design Project—Environmental. 5 Hours.
Using teams, students design a civil engineering project that primarily involves the environmental subdiscipline. Design teams are advised by a faculty member and engineering practitioners. Lectures cover supplemental technical background specific to the project, as well as cross-disciplinary aspects of project development, value engineering, aesthetics, and constructability. Integrates project design with further development of student communications skills; students present the design to practicing engineers and interested parties such as community groups.

CIVE 4766. Senior Design Project—Geotechnical. 5 Hours.
Using teams, students design a civil engineering project that primarily involves the geotechnical subdiscipline. Design teams are advised by a faculty member and engineering practitioners. Lectures cover supplemental technical background specific to the project, as well as cross-disciplinary aspects of project development, value engineering, aesthetics, and constructability. Integrates project design with further development of student communications skills; students present the design to practicing engineers and interested parties such as community groups.

CIVE 4767. Senior Design Project—Structural. 5 Hours.
Using teams, students design a civil engineering project that primarily involves the structural subdiscipline. Design teams are advised by a faculty member and engineering practitioners. Lectures cover supplemental technical background specific to the project, as well as cross-disciplinary aspects of project development, value engineering, aesthetics, and constructability. Integrates project design with further development of student communications skills; students present the design to practicing engineers and interested parties such as community groups.

CIVE 4768. Senior Design Project—Transportation. 5 Hours.
Using teams, students design a civil engineering project that primarily involves the transportation subdiscipline. Design teams are advised by a faculty member and engineering practitioners. Lectures cover supplemental technical background specific to the project, as well as cross-disciplinary aspects of project development, value engineering, aesthetics, and constructability. Integrates project design with further development of student communications skills; students present the design to practicing engineers and interested parties such as community groups.

CIVE 4777. Climate Hazards and Resilient Cities Abroad. 4 Hours.
Focuses on the science of “global weirding”—unprecedented changes in weather caused by global warming and natural climate variability. Introduces the physical-scientific basis of climate, computer models of the earth system, statistical tools for the analysis of climate model, and remote sensor data. Also introduces the concept of urban resilience, focusing on preventing natural hazards from turning into catastrophic disasters in densely populated and vulnerable regions. Examines multifaceted aspects of resilience, including governance, emergency response, infrastructural, informational, social, and policy aspects. Encourages students to consider the science, engineering, and policy challenges in transforming vulnerable urban and coastal regions to climate-resilient cities and to examine how societies can learn from each other by comparing Boston with the country visited. Taught abroad.

CIVE 4778. Climate Adaptation and Policy Abroad. 4 Hours.
Explores how the country visited plans to adapt to climate change and natural hazards and how that country participates in international climate and emissions negotiations, within the context of its history and culture. Focuses on how an emerging economy adjusts to the reality of climate change/extremes and how citizens may drive decisions and policy. Incorporates topics from climate change, environmental sciences, civil and chemical engineering, remote sensing, social sciences, electrical engineering, computer science, and the management sciences. Encourages students to think about possible policy lessons for the United States. Offers students an opportunity to visit key sights. Culminates with a mock “climate change war game,” simulating an event in which international negotiators meet to formulate treaties on climate change adaptation and mitigation. Taught abroad.

CIVE 4779. Climate Hazards and Resilient Cities Abroad. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

CIVE 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

CIVE 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

CIVE 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CIVE 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

CIVE 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CIVE 4993. Independent Study. 1-4 Hours.
Offers theoretical or experimental work under individual faculty supervision. May be repeated without limit.
CIVE 4994. Internship. 4 Hours.
Offers students an opportunity for internship work. May be repeated without limit.

CIVE 4996. Experiential Education Directed Study. 4 Hours.
Draws upon the student's approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using the course to fulfill their experiential education requirement. May be repeated without limit.

CIVE 5221. Construction Project Control and Organization. 2 Hours.
Overviews the organization of construction firms at the general corporate level and the project level. Covers cost, schedule, budget, and financial control of projects. Also examines the flow of information between parties to the project.

CIVE 5231. Alternative Project Delivery Systems in Construction. 2 Hours.
Offers a comprehensive overview of alternative construction project delivery systems in the public and private sectors; project life cycle including project development, schedule, cost and risk management, quality assurance/quality control, project management, and project closeout; innovative financing strategies including contractor financing, franchises, and super turnkey. Focuses on the analysis of design/bid/ build execution compared to design/build and construction management systems of delivery. Examines international projects, contracts, and partnering options—for example JVs and alliances—as vehicles to ensure the meeting of project objectives. Uses case studies to identify and practice the management skills required for successful D/B project execution including effective communication, negotiations, and team building.

CIVE 5250. Organic Pollutants in the Environment. 4 Hours.
Introduces principles that govern the fate and transport of organic chemicals released to the environment. Topics include chemical structure and thermodynamic properties and how they predict physical processes that control the distribution of contaminants between the atmosphere, fresh and marine surface waters, groundwater, soils, sediments, and biota. Introduces models and methods for predicting fate and transport of organic contaminants within and between environmental media, including molecular diffusion, transport across boundaries, and box models. Explores concepts linking environmental chemistry with ecotoxicology, including bioaccumulation, food web models, and risk assessment. Uses case studies and real-world scenarios to illustrate concepts. Prereq: (a) Either CHEM 1151 or CHEM 1211 and junior or senior standing or (b) graduate standing.

CIVE 5260. Environmental Fluid Mechanics. 4 Hours.
Focuses on fundamentals of fluid mechanics, but with application to the natural and built environment based on transport and dispersion phenomena. Reviews theory necessary for an understanding of environmental fluid flows and methods of observation, including acoustic Doppler current profiles, profiling towers, and modeling, including large eddy simulation (LES).

CIVE 5261. Dynamic Modeling for Environmental Investment and Policymaking. 4 Hours.
Introduces the theory, methods, and tools of dynamic modeling for policy and investment decision making, emphasizing environmental issues. Makes use of state-of-the-art computing methods to translate theory and concepts into executable models and offers extensive hands-on modeling experience. Topics include management of discrete flows (e.g., models of traffic systems); discounting, intertemporal optimization (e.g., models of resource extraction); dynamic games (e.g., models for adaptive management); and treatment of risk, uncertainty, novelty, and complexity (e.g., for investment and policymaking).

CIVE 5270. Environmental Protection and Management. 4 Hours.
Examines public and private environmental quality management and resource protection systems. Considers regulatory issues, risk management approaches, local vs. regional impacts, long-term sustainability, and economic/financial issues. Covers selected current topics and a broad range of specific environmental issues.

CIVE 5271. Solid and Hazardous Waste Management. 4 Hours.
Introduce various aspects of integrated solid waste management system and hazardous waste management practices. Includes both engineering principles as well as socioeconomic and regulatory issues surrounding solid and hazardous waste management. Provides sufficient background to enable the student to understand, evaluate, and critique the design of and the decisions in various waste management alternatives.

CIVE 5275. Life Cycle Assessment of Materials, Products, and Infrastructure. 4 Hours.
Reviews engineering models that form the foundation of life cycle assessment (LCA), its computational structure, and relevant international standards. LCA is a widely used systems-modeling method for quantifying the environmental and health implications of a product over its entire life cycle, from manufacturing to use to disposal. This information guides design, technology decisions, and policy on topics ranging from consumer products to green buildings to the large-scale energy technologies. Students receive several hands-on training modules for popular commercial and open-source LCA software packages and have an opportunity to work examples for various products and systems. Students then carry out independent group projects for real clients in industry and government.

CIVE 5280. Remote Sensing of the Environment. 4 Hours.
Introduces remote sensing techniques, including obtaining, visualizing, and analyzing satellite data. Examines physical processes, methods, and data products used in satellite remote sensing of the Earth's environment. Topics include active and passive remote sensing methods based on fundamentals of electromagnetic radiation, concepts used to develop data products from the remotely sensed measurements, and a suite of satellite data products to investigate current and past conditions of the Earth's terrestrial and ocean surfaces. Uses geographic information systems (GIS) and student-developed programs to view and interpret satellite data. Knowledge of GIS, R, and Python is preferred.

CIVE 5300. Environmental Engineering Laboratory. 4 Hours.
Offers a laboratory-based course that provides students with hands-on experiences to monitor and evaluate relevant environmental processes. Introduces the theory, application, methodology, and instrumentation used in planning, sampling, and analyzing environmental contaminants in air, water, and soil. Emphasizes instrument selection and quality control, including documentation, calibration, data analysis and interpretation, and sample management. Offers students an opportunity to demonstrate the capability to select measurements strategies and sensing technologies to analyze environmental samples, conduct laboratory experiments, critically analyze experimental data, and present the experimental results.

CIVE 5321. Geoenvironmental Engineering. 4 Hours.
Covers definitions and regulations, soil formation and mineralogy, hydraulic conductivity measurements, reactive contaminant transport through fine-grained soils, landfill and liners design, and seepage barriers and cutoff walls. Introduces site characterization and remediation.
CIVE 5373. Transportation Planning and Engineering. 4 Hours.
Discusses urban transportation planning and engineering for modes other than highway. Covers travel demand forecasting for both the short and long term including impact analysis methods, simple elasticity models, and the four-step model system of trip generation, trip distribution, modal split, and network assignment. Introduces transit service analysis and design. Other topics include capacity, service, and engineering design basics for different travel modes, such as bus, airport, rail, and bicycle. Considers the environmental impact, economic evaluation, and financial impact of different modes of transportation.

CIVE 5376. Traffic Engineering. 4 Hours.
Explores traffic flow theory and measurement, capacity and level of service analysis for intersections and urban arterials, intersection layout design, intersection signal plan design for both isolated intersections and arterials, parking analysis and design, and congestion mitigation and traffic management. Offers students an opportunity to practice with standard software.

CIVE 5522. Structural Analysis 2. 4 Hours.

CIVE 5525. Prestressed Concrete Design. 4 Hours.
Introduces analysis and flexural design of prestressed concrete members, allowable stress in concrete and steel, pre- and posttensioned concrete beams, strength evaluation, and prestressed concrete bridge design. Requires one semester of undergraduate concrete design or one semester of undergraduate structural analysis.

CIVE 5536. Hydrologic Engineering. 4 Hours.
Introduces principles of engineering hydrology. Covers the hydrologic cycle; rainfall-runoff relationships; hydrologic flood routing; and ground water hydraulics. Applies these concepts to issues such as water supply and storm water management. Includes project component.

CIVE 5698. Special Topics in Civil Engineering (Nontechnical Elective). 2-4 Hours.
Offered when the need for a special topic is evident to faculty and students. Initiated by the appropriate faculty members and discipline committee and approved by the department. May not be used as a technical elective in a degree program. May be repeated up to five times for up to 12 total credits.

CIVE 5699. Special Topics in Civil Engineering. 2,4 Hours.
Offered when the need for a special topic is evident to faculty and students. Topics are initiated by appropriate faculty members and discipline committee and approved by the department. May be repeated up to five times for up to 12 total credits.

CIVE 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CIVE 5978. Independent Study. 1-4 Hours.
Offers theoretical or experimental work under individual faculty supervision. May be repeated without limit.

CIVE 5984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CIVE 6566. Sustainable Urban Transportation: Netherlands. 4 Hours.
Examines how Dutch communities and their transportation systems are planned and designed to promote ABC (all-but-car) transportation, traffic safety, and livability. Topics include design of urban bicycling infrastructure for the mainstream population; planning and service design for high-quality public transportation; urban planning in support of transit, bicycle, and foot transportation, including both suburban development and urban redevelopement; and Vision Zero/Systematic Safety policy and design for traffic safety and its application to urban areas. Taught in study-abroad format in the Netherlands.

CIVE 6777. Climate Hazards and Resilient Cities Abroad. 4 Hours.
Combines the science, engineering, economic, social, and policy aspects of how cities can prepare themselves for climate change and natural hazards. Focuses on the science of unprecedented changes in weather caused by global warming and natural climate variability. Introduces the physical-science basis of climate, computer models and statistical tools, and remote sensor data. Introduces the concept of urban resilience, focusing on preventing natural hazards from turning into catastrophic disasters in densely populated regions. Examines resilience, including governance, emergency response, infrastructural, informational, social, and policy aspects. Encourages students to consider the science, engineering, and policy challenges in transforming vulnerable urban and coastal regions to climate-resilient cities and to examine how societies can learn from each other by comparing Boston with the country visited. Taught abroad.

CIVE 6778. Climate Adaptation and Policy Abroad. 4 Hours.
Explores how the country visited plans to adapt to climate change and natural hazards and how it chooses to participate in international climate and emissions negotiations. Focuses on how an emerging economy adjusts to the reality of climate change/extremes and how the will of citizens may drive decisions and policy. Incorporates topics from climate change, environmental sciences, civil and chemical engineering, remote sensing, social sciences, electrical engineering, computer science, and the management sciences. Encourages students to think about possible policy lessons for the United States. Culminates with a mock climate change war game, simulating an event in which international negotiators meet to formulate treaties on climate change adaptation and mitigation. Taught abroad.

CIVE 6960. Exam Preparation—Master's. 0 Hours.
Offers the student the opportunity to prepare for the master's qualifying exam under faculty supervision.

CIVE 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CIVE 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

CIVE 6965. Co-op Work Experience Abroad. 0 Hours.
Provides eligible students with an opportunity for work experience abroad. May be repeated without limit.

CIVE 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.
CIVE 7100. Applied Time Series and Spatial Statistics. 4 Hours.
Offers an interdisciplinary course covering the fundamentals of time series and spatial statistics with applications in engineering, science, and business. Introduces analysis and forecasting methods for time series, spatial, and spatiotemporal data. Discusses classical time or frequency domain methods, as well as recent techniques motivated from computer science, physics, statistics, or engineering. Case studies relate to ongoing research and to real-world examples. A demo project is selected by the instructor based on discussion with individual students. A computer-based final project can be tailored to student interests in environmental engineering, sustainability sciences, security threat assessments, social sciences, business, or management science and finance. Requires undergraduate probability and statistics (CIVE 3464 or equivalent); background in programming languages such as MATLAB or R helpful but not required.

CIVE 7110. Critical Infrastructure Resilience. 4 Hours.
Introduces the concept of resilience by exploring engineering concepts and perspectives to offer students an opportunity to develop the ability to be prepared for and adapt to challenging situations and scenarios—e.g., globalization, climate change, security threats, and natural disasters—on critical infrastructures and key resources. Topics include application of tools for infrastructure modeling and risk assessment; identification of natural and man-made hazards; management of disaster risks and communications; resilience design; and future challenges, policy, and novel approaches to advance resilience. Explores application to real-life examples through group projects. Requires one semester of undergraduate statistics.

CIVE 7220. Construction Management. 4 Hours.
Presents all aspects of construction management, with emphasis on cost and schedule. Provides conceptual and detailed cost estimates and network-based scheduling techniques (CPM and PERT). Covers project cash flow and finances. Requires one semester of undergraduate probability and statistics.

CIVE 7230. Legal Aspects of Civil Engineering. 4 Hours.
Overviews the U.S. legal system and the theories necessary for the comprehension of business and contractual liabilities. Discusses various types of contracts, forms of business ownership, claims and disputes, and environmental law.

CIVE 7240. Construction Equipment and Modeling. 4 Hours.
Focuses on the selection and application of earthmoving equipment. Topics include equipment production systems and cost analysis, simulation modeling of equipment operations, statistical aspects of computer simulation, and risk analysis fundamentals. Requires one semester of construction management or one semester of undergraduate soil mechanics.

CIVE 7250. Environmental Chemistry. 4 Hours.
Examines applications of chemistry to environmental engineering. Covers properties of water and pollutants, acid-base reactions, pH, alkalinity, equilibrium chemistry, chemical kinetics, chemical thermodynamics, coordination chemistry, precipitation-dissolution reactions, surface chemistry, adsorption-desorption, redox reactions, and organic chemistry as it relates to the environment. Includes relevant laboratory exercises such as colorimetry, gravimetric, and electrochemical methods; atomic absorption spectrophotometry; and ion and gas chromatography. Requires one semester of undergraduate chemistry.

CIVE 7251. Environmental Biological Processes. 4 Hours.
Examines microbiology with emphasis on biological processes in environmental engineering applications. Topics include cell structure, morphology, cell nutrition and growth, energy transfer and utilization, aerobic and anaerobic microbial metabolism, biological wastewater process theory and modeling, biological nutrients removal, and disinfection of relevant microorganisms. Includes relevant laboratory exercises of treatment parameters used to monitor the biological processes, such as BOD, TOC, COD, gravimetric methods, and dissolved oxygen. Also covers enzyme kinetics and evaluation of kinetic coefficients for biotreatment. Requires one semester of undergraduate chemistry or one semester of undergraduate biology.

CIVE 7252. Water Engineering, Resources, and Energy Recovery. 4 Hours.
Covers theory and design principles of major water and wastewater treatment processes. Focuses on the emerging issues in water sustainability and advances in fundamental science and technology in integrating scientific principles, engineered processes, and systems analyses to address diverse challenges related to society’s growing water needs and their nexus with energy and the environment. Designed to stimulate multidisciplinary thinking and research among traditional areas of civil and environmental engineering, biology, chemistry, modeling, data science, and others. Special projects are designed to have students working in multidisciplinary teams to develop sustainable solutions to meet the present and future water and resources needs of the society. Given current conditions, innovative approaches and creative energy solutions for self-sustaining wastewater treatment facilities are needed. Requires one semester of undergraduate chemistry or one semester of undergraduate biology.

CIVE 7255. Environmental Physical/Chemical Processes. 4 Hours.
Examines the processes of physical and chemical phenomena related to water quality and water treatment within environmental engineering. Presents the use of fundamental theory, mathematical description, and applied knowledge of these processes and how they are used to characterize water quality in natural systems (lakes, rivers) and to predict performance in engineered systems (water treatment systems). Uses a mass balance and reaction kinetics approach to derive analysis and design equations for water treatment unit operations. Covers physical and chemical processes, including reaction kinetics, flow regimes, dissolved solute removal, particulate removal, phase transfer processes, and redox processes. Includes laboratory demonstrations. Basic knowledge of water quality, environmental chemistry, and differential equations preferred.

CIVE 7260. Hydrologic Modeling. 4 Hours.
Covers evaluation of surface and ground water as an integrated resource using hydrologic principles. Topics include the hydrologic cycle (precipitation, interception and surface storage, infiltration, evapotranspiration, lakes and stream flow, and ground water discharge to oceans), hydrologic measurements and monitoring, surface water hydrology (rainfall/runoff modeling, hydrographs, hydrograph routing, and snow hydrology), and ground water hydrology (basic ground water hydraulics and porous media properties, aquifers, regional flow, and basin development and yield). Additional topics include hydrologic design, stochastic hydrology, and simulation modeling. Requires knowledge of differential equations and undergraduate probability and statistics.
CIVE 7261. Surface Water Quality Modeling. 4 Hours.
Examines mechanisms through which environmental water quality becomes degraded, control strategies for mitigating degradation, and resource management strategies for preventing degradation. Topics include contaminant sources, eutrophication processes, environmental transport and transformation processes, water quality measurements and monitoring, contaminant fate and transport modeling in lakes, rivers, estuaries, and ground water, water quality control methods and strategies, and water resource protection regulations and strategies.

CIVE 7263. Groundwater Quality Modeling. 4 Hours.
Examines methods and models used to evaluate flow and contaminant transport in ground water, focusing on practical applications. Topics in ground water flow include one-dimensional flow, well hydraulics, aquifer parameter tests, unsaturated zone flow, seepage from canals and ditches, seepage through earth structures, and an introduction to aquifer modeling. Topics in ground water quality include chemical transport and transformation processes, chemical fate and transport modeling in ground water, and ground water quality measurement and monitoring. Studies solution methods that focus on analytical solutions and flow nets, with an introduction to numerical methods. Also discusses ground water quality control and resource protection methods, strategies, and regulations.

CIVE 7272. Air Quality Management. 4 Hours.
Explores engineering theory and practice related to air resources management. Focuses on modeling dispersion and reactions for atmospheric pollutants and on analysis of systems for controlling gaseous and particulate emissions including dry collection, wet collection, absorption, and catalytic processes. Also addresses biological and chemical aspects of air pollution including toxicological issues, physiological effects of aerosols, analysis of organic and inorganic constituents of the atmosphere, and rationale for establishing air quality criteria and standards. Requires one semester of undergraduate chemistry.

CIVE 7301. Advanced Soil Mechanics. 4 Hours.
Studies characterization of soils, soil mineralogy and chemistry, stresses within a soil mass, basic porous media flow principles, effective stress principle, compaction, drained and undrained stress-strain-strength concepts, and consolidation theory and its application. Requires one semester of undergraduate soil mechanics.

CIVE 7302. Advanced Foundation Engineering. 4 Hours.
Focuses on bearing-capacity and settlement analysis of conventional shallow foundations and combined footings; mat design; lateral earth pressure theory and application to retaining wall design, braced excavations, sheet pile wall design, and slurry trench walls; bearing-capacity design and analysis for deep foundations; and laterally loaded piles, friction piles, and pile-driven analysis. Requires one semester of undergraduate soil mechanics.

CIVE 7311. Soil and Foundation Dynamics. 4 Hours.
Considers dynamic loads, blast vibrations and monitoring, dynamic response of single-mass, multi degree-of-freedom systems, design of machine foundations, dynamic soil properties, ground response analysis, liquefaction, and seismic analysis of slopes and dams. Requires one semester of undergraduate statics.

CIVE 7312. Earthquake Engineering. 4 Hours.
Studies plate tectonics, seismology, faults and characteristics, ground motions, seismic hazard analysis, dynamic response of single degree-of-freedom system, response spectrum, site effects, and seismic design considerations for buildings, bridges, and earth-retaining structures. Requires one semester of undergraduate statics.

CIVE 7330. Advanced Structural Analysis. 4 Hours.
Explores modern methods of structural analysis, matrix formulation of flexibility and stiffness methods, and analysis of structures with material and geometric nonlinearities. Also introduces energy methods. Requires CIVE 5522 or one semester undergraduate matrix structural analysis.

CIVE 7331. Structural Dynamics. 4 Hours.
Examines single and multi degree-of-freedom systems subjected to arbitrary dynamic loads. Topics include convolution and frequency domain solutions, introduction to analytical dynamics, damping models, modal analysis of classically damped systems, and state-space formulation. Requires one semester of undergraduate structural analysis.

CIVE 7340. Seismic Analysis and Design. 4 Hours.
Considers the response of linear systems to coherent and incoherent support motion, nonlinear response, the concept of ductility, inelastic response spectra, soil-structure interaction, random vibration theory, development of seismic codes, and characterizations of earthquakes for design.

CIVE 7341. Structural Reliability. 4 Hours.
Examines applications of probability theory and random variables for determining the reliability of structures. Includes the following topics: formulation of reliability for structural components and systems; first-order second-moment method, first- and second-order reliability methods, and simulation methods; analysis of model uncertainty and Bayesian parameter estimation technique; load and resistance models and bases for probabilistic structural codes; and time-dependent reliability methods. Assumes no prior knowledge of probability theory.

CIVE 7342. System Identification. 4 Hours.
Studies methods for identifying the fundamental characteristics of structures. Includes topics in linear algebra (singular value and QR decomposition, pseudoinversion, and so on); input-output relationships for linear time-invariant systems; frequency response functions; signal processing fundamentals; realization theory; the eigensystem realization algorithm; use of observers in identification; and introduction to out-only system identification. Requires one semester of undergraduate structural analysis.

CIVE 7343. Experimental Modal Analysis. 4 Hours.
Covers the fundamentals of signals, filters, and system identification in the time and frequency domain as applied to structural engineering. Offers students an opportunity to carry out projects in the laboratory to obtain practical experience in modal identification, model updating, and damage diagnosis. Requires one semester of undergraduate structural analysis.

CIVE 7350. Behavior of Concrete Structures. 4 Hours.
Considers flexural mechanics of reinforced concrete cross sections and members; combined bending, axial, and shear loads; advanced topics in shear, torsion, and connection design; and application of plastic analysis to reinforced concrete frames, their behavior under cyclic loading, and response of structures under seismic actions. Requires one semester of undergraduate concrete design.

CIVE 7351. Behavior of Steel Structures. 4 Hours.
Studies the behavior and design of steel structural systems, including structural stability; advanced topics in mechanics and design of structural steel members, including combined axial, flexure, and shear loads; composite steel/concrete beam and column behavior and design; plate girders; and advanced topics in connection design. Requires one semester of undergraduate steel design.
CIVE 7354. Wind Engineering. 4 Hours.
Covers atmospheric circulation, atmospheric boundary layer winds, bluff-body aerodynamics, introduction to random vibration theory, response of structures to fluctuating wind loads, aeroelastic phenomena, wind-tunnel and full-scale testing, nonsynoptic winds (hurricanes, tornadoes, etc.), wind-load standards, and design applications.

CIVE 7355. Advanced Bridge Design. 4 Hours.
Studies the behavior and design of prestressed concrete bridges. Includes conceptual design, flexural design, shear design, and torsional design of prestressed elements. Analyzes indeterminate prestressed structures and design for prestressed concrete bridges, including material properties, loads, reinforcement, structural analysis, temperature effects, and construction methods. Covers solid slab, T-beam, and box girder. Final projects include complete designs for a simple supported girder bridge and a continuous girder bridge using load factor and resistance design (LFRD) specifications. Requires one semester of undergraduate structural analysis.

CIVE 7357. Advanced Structural Mechanics. 4 Hours.
Covers stress and strain analysis of structural components, including beams and plates subject to bending, shear, tension, and compression, as well as nonsymmetric geometry and loading cases. Considers the derivation and analysis of elastic instabilities of structural components, including the lateral, torsional, and lateral-torsional buckling of beams and the inelastic yielding and concentrated plasticity of beam components. Includes 3D stress and strain analysis for elastic and inelastic continua as related to advanced structural problems. Introduces variational methods. Requires one semester of graduate structural analysis.

CIVE 7380. Transportation Performance and Simulation Models. 4 Hours.
Reviews concepts and methods for analyzing the performance of complex transportation systems as well as methodologies for planning, designing, monitoring, and managing and controlling traffic flows over complex transportation networks. Topics include deterministic and probabilistic models, elements of queuing theory, network optimization algorithms, and simulation. Applications include traffic flow modeling, capacity analysis of diverse transportation facilities, level of service and estimation of delays, optimal design of transportation network services, and traffic assignment.

CIVE 7381. Transportation Demand Models. 4 Hours.
Examines methods and models used to predict urban travel demand. Introduces supporting statistical methods including linear regression, maximum likelihood estimation, and statistical tests. Also studies the effect of variable demand on project evaluation. Requires one semester of undergraduate probability and statistics.

CIVE 7382. Advanced Traffic Control and Simulation. 4 Hours.
Covers principles and logic of traffic signal control, including actuated control, coordinated control, transit signal priority, and signal control schemes for better accommodating pedestrians and bicycles. Topics include traffic microsimulation principles for urban street networks, intersection and network performance modeling and measurement, and design and programming of traffic signal control using traffic microsimulation.

CIVE 7385. Public Transportation. 4 Hours.
Studies the analysis, planning, and operational design of urban public transportation systems. Topics include service design and scheduling, such as route and system-level design and optimization, passenger flow modeling, rail operations, and bus operational control including automatic vehicle location and priority at signalized intersections. Also covers passenger sampling, ridership estimation, demand forecasting, data collection design, and service quality monitoring, with an emphasis on intelligent systems. Discusses policy issues including pricing, subsidy, and priority. Introduces supporting mathematical methods in optimization and statistical sampling. Requires knowledge of probability theory.

CIVE 7387. Design Aspects of Roadway Safety. 4 Hours.
Concentrates on roadway design features that affect safety, including system users and design elements. Topics include crash causation and countermeasures, statistical procedures for crash analysis, and geometric design improvements for roads and intersections. Analyzes crash data, including both intersecting and nonintersecting locations. Presents concepts, including design, to create a safer transportation system while addressing specific high-crash locations.

CIVE 7388. Special Topics in Civil Engineering. 2,4 Hours.
Offered when the need for a special topic is evident to faculty and students. The course is initiated by the appropriate faculty members and discipline committee and approved by the department. May be repeated without limit.

CIVE 7390. Special Topics in Construction Management Engineering. 2,4 Hours.
Offered when the need for a special topic is evident to faculty and students. The course is initiated by the appropriate faculty members and discipline committee and approved by the department. May be repeated without limit.

CIVE 7392. Special Topics in Environmental Engineering. 2,4 Hours.
Offered when the need for a special topic is evident to faculty and students. The course is initiated by the appropriate faculty members and discipline committee and approved by the department. May be repeated without limit.

CIVE 7394. Special Topics in Geotechnical Engineering. 2,4 Hours.
Offered when the need for a special topic is evident to faculty and students. The course is initiated by the appropriate faculty members and discipline committee and approved by the department. May be repeated without limit.

CIVE 7396. Special Topics in Structural Engineering. 2,4 Hours.
Offered when the need for a special topic is evident to faculty and students. The course is initiated by the appropriate faculty members and discipline committee and approved by the department. May be repeated without limit.

CIVE 7398. Special Topics in Transportation Engineering. 2,4 Hours.
Offered when the need for a special topic is evident to faculty and students. The course is initiated by the appropriate faculty members and discipline committee and approved by the department. May be repeated without limit.

CIVE 7400. Seminar. 0 Hours.
Presents topics of an advanced nature by staff, outside speakers, and students in the graduate program. This course must be attended every semester by all full-time graduate students in the Department of Civil and Environmental Engineering. Environmental engineering students permitted. May be repeated without limit.

CIVE 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
CIVE 9976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CIVE 9778. Independent Study. 1-4 Hours.
Offers an individual effort in an area selected by student and adviser and approved by the Department Discipline Committee resulting in a definitive report. May be repeated without limit.

CIVE 9990. Thesis. 1-8 Hours.
Offers analytical and/or experimental research conducted by arrangement with and under the supervision of the department. May be repeated without limit.

CIVE 9994. Thesis Continuation—Part Time. 0 Hours.
Continues thesis work conducted under the supervision of a departmental faculty member. May be repeated without limit.

CIVE 9996. Thesis Continuation. 0 Hours.
Offers continued thesis work conducted under the supervision of a departmental faculty.

CIVE 8674. Master’s Report. 2,4 Hours.
Offers an individual effort consisting of laboratory and/or literature investigation and analysis of advanced design of a project in an area of civil engineering selected by student and adviser resulting in a definitive report. Requires a completed report seven years from the start of the master’s program.

CIVE 8960. Exam Preparation—Doctoral. 0 Hours.
Offers students an opportunity to prepare for the PhD qualifying exam under faculty supervision. Intended for students who have completed all required PhD course work and have not yet achieved PhD candidacy; students who have not completed all required PhD course work are not allowed to register for this course. May be repeated once.

CIVE 8964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

CIVE 8966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

CIVE 8982. Readings. 1-4 Hours.
Offers selected readings under the supervision of a faculty member. May be repeated without limit.

CIVE 8984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CIVE 9000. PhD Candidacy Achieved. 0 Hours.
Indicates successful completion of program requirements for PhD candidacy.

CIVE 9984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CIVE 9986. Research. 0 Hours.
Offers an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

CIVE 9990. Dissertation. 0 Hours.
Offers analytical and/or experimental research conducted by arrangement with and under the supervision of the department. Open to full-time students only. Requires PhD candidacy in civil engineering or in interdisciplinary engineering. May be repeated once.

CIVE 9996. Dissertation Continuation. 0 Hours.
Offers continued thesis work conducted under the supervision of a departmental faculty. Requires prior completion of CIVE 9990 twice and PhD candidacy in civil engineering or in interdisciplinary engineering. May be repeated without limit.

CIV 0050. Using Computers in Building Design and Construction. 2.2 Hours.
Introduces the concepts of how computer equipment and programs are used to solve business problems, specifically, covering how standard commercial software tools are applicable to the solution of building design, construction, and facilities management business problems. Uses word processing, spreadsheets, desk information management systems, communications, and Internet overview. Uses Microsoft Windows, Microsoft Office Suite (MS-Word, MS-Excel, MS-Outlook), and Netscape for classroom exercises. Offers students an opportunity to develop various application solutions for problems in budgeting and cost estimating, proposal writing, and contract management in this hands-on, lab-based course.

CIV 0108. Design of Building Plumbing Systems. 3 Hours.
Introduces building plumbing systems design for use in residential and commercial buildings. Offers instruction in the calculations, design, and layout of systems, including water supply and distribution, wastes, vent and drainage systems, and commercial and medical gases. Focuses on relevant aspects of the Massachusetts State Plumbing Code. Offers students an opportunity to work with and implement the statutes in the design of several complete plumbing systems.

CIV 0109. Design of Building Electrical Systems. 3 Hours.
Introduces the design of electrical systems for residential and commercial structures. Topics include the principles of electricity, single-phase and three-phase power, voltage selection, branch and feeder circuit design and calculations, transformer and panel board design, building load analysis, motor feeder calculation, power factor correction, and lighting fundamentals. References electrical code article where required.

CIV 0111. Architectural Technology and Building Materials. 3 Hours.
Introduces materials and methods used in building construction. Reviews light and heavy construction, with attention to foundations, framing, roofing, interior and exterior finish, insulation, hardware, and painting. Topics include wood materials, concrete and masonry construction, steel, acoustical and insulation materials, and glass. Discusses how to select materials based on application, cost, CSI format, and other factors.

CIV 0114. Construction Law. 2.5 Hours.
Provides an intensive, practice-oriented introduction to construction law. Topics include principles of contract formation; roles and principal obligations of the owner, lenders, design professionals, construction manager, and contractors; types of contracts used in construction practice; bidding for private and public work; construction bonds; standard AIA, AGC, and other contract forms; rules for interpreting contracts; authority and responsibility during the construction phase; and arbitration/litigation as a means of resolving disputes. Discusses selected chapters of the Massachusetts General Laws relating to construction. Offers students an opportunity for solid grounding in the legal principles on which the construction industry operates.
CIV 0134. Scheduling Construction Projects. 2.5 Hours.
Designed for project managers, schedulers, job-site managers, foremen, and small business owners. Topics include introduction to project scheduling tools, such as Gantt Charts, PERT, CP/M, and network analysis from the viewpoint of project planning and control. Introduces computer applications and techniques. Discusses project "crash" techniques as applied to cash flow and the avoidance of penalties.

CIV 0180. Advanced AutoCAD. 2 Hours.
Offering advanced AutoCAD classes is a novel and innovative endeavor focused on enhancing students' understanding of CAD principles and techniques. The course delves into complex aspects of AutoCAD design and management, as well as the use of advanced tools and techniques for creating professional-quality designs.

CIV 0114. Construction Estimating and Bidding. 3 Hours.
Introduces construction cost estimating from receipt of plans and specifications to taking off the quantities and estimating materials and labor. Topics include reviewing subcontractor quotes, interpreting contract documents, assessing overhead costs, determining profit, overhead factors, adjustments, and bidding strategies.

CIV 0119. Managing Construction Contracts. 2.5 Hours.
Focuses on improved methods of planning, forming, administering, and monitoring contracts. Uses a systems approach to contract planning and formation. Introduces and examines change orders, disputes, schedule delays, and claims.

CIV 0128. Principles of Facilities Management 1. 2.2 Hours.
Designed to prepare students for the leadership role within the business. Topics include delegating authority, communication, organizing, motivating employees, selecting and appraising employees, leading employees, managing the boss, conducting meetings, handling problem employees, exercising control over productivity, quality and safety, team building, and handling personal and employee stress.

CIV 0129. Principles of Facilities Management 2. 2.2 Hours.
Seeks to link and integrate the specialized technical and engineering skills that form facilities management and that are presented in the certificate in facilities management. Examines the various practices that combine principles of engineering sciences, architecture, human behavior, and business administration to create facilities management.

CIV 0132. Landscape and Grounds Management. 2.2 Hours.
Designed for those who maintain either small or large areas. Explores money-saving tips on equipment, fertilizer, and the use of proper design to cut maintenance costs. Discusses safety, scheduling, flower planting, types of grasses and shrubs, and snow removal. Fall and spring classes include a site survey of the school grounds.

CIV 0146. Construction Project Management 1. 2.2 Hours.
Initiates a project management approach to planning, scheduling, and controlling a project through a case study method of analysis. Offers students an opportunity to understand new project management techniques, organization principles, and group synergism. Seeks to prepare the student for CIV 0246.

CIV 0246. Construction Project Management 2. 2.2 Hours.
Introduces successful construction project management from project planning and design through project award, buyout, implementation, on-site monitoring and control, completion, and startup. Uses project management techniques to solve actual construction cases in a team-oriented environment. Examines a step-by-step project management analysis of a typical medium-sized construction project's requirements. Recommended for all those aspiring to a responsible position in project management.

CIV 0343. Introduction to Project Management . 2 Hours.
Introduces the concepts of identifying and managing "risk," as well as practices for managing change throughout the life of a project. The objective is to provide a solid foundation for a more in-depth study of project management.
CIV 0663. Facilities Management and Leadership Capstone. 2 Hours.
Assigns participants a real-world project, which they are required to initiate, plan, execute, control, and close out. Throughout the project process, participants are expected to exercise skills in hiring appropriate staff, supervising and coaching project employees, managing scope, identifying and mitigating risk, and using other best practices to lead and manage a project for successful results. Participants are expected to analyze and reflect on their own leadership, communication, strategic planning, and problem-solving strengths and weaknesses and to keep a journal to facilitate the self-reflection process and to present project findings and results to the class.

Commerce and Economic Development - CPS (CED)

CED 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. May be repeated up to nine times.

CED 6010. Applied Microeconomic Theory. 4 Hours.
Explores the microeconomic theory required to apply the leading literature and develop models to explain behavior of households, firms, and markets, as well as to evaluate economic policy. Various elasticity concepts and applications, theories of demand and production, and derivation of cost curves comprise the core theory for this course. Presents analyses of pricing and output behavior in the several market structures with the allocation of welfare and the pricing of resources.

CED 6020. Applied Macroeconomic Theory. 4 Hours.
Presents several theoretical approaches to short-run economic instability and long-run growth. Uses conceptual and mathematical tools to examine the major determinants of fluctuations in employment and price level, as well as the rate of economic growth. The study of inflation and unemployment and the interaction of the product, financial, and labor markets are at the core of this course. From this foundation, theoretical models are used to evaluate monetary and fiscal policy approaches and tools.

CED 6030. Applied Mathematics and Statistics for Economics. 4 Hours.
Seeks to meet the practitioners' needs for applied research and analysis. Offers students an opportunity to develop and reinforce mathematics tools and basic probability, descriptive statistics, estimation techniques, statistical hypotheses, sampling, analysis of variance, correlation, and regression analysis in the context of economics. Computer applications are an integral part of the course and support theoretical and applied analysis required for professional development.

CED 6040. Applied Econometrics. 4 Hours.
Depicts the application of econometrics, the primary research method used by practicing economists. Addresses topics such as applied economic problems, modeling framework, data collection, estimation techniques, and interpretation of results.

CED 6050. Commerce and Economic Development. 4 Hours.
Introduces the fundamentals of commerce and economic development and policies designed to spur commercial activity and target growth. Information, institutions, and innovation are added to basic neoclassical economic models of markets and development in order to frame consideration of different rates of growth, technological advance, and industrial change. Offers students an opportunity to learn how to apply microeconomic and macroeconomic models, as well as different theoretical perspectives, to evaluate important local and global public policy issues of importance.

CED 6070. Economics of Human Capital. 4 Hours.
Focuses on an economic analysis of the labor market, the labor force, and workers' wages and earnings. Includes other topics such as the demand for labor by businesses and industries; wage inequality and its determinants; the changing occupational and industrial structure; the economic impact of unions; and the influence of related labor market institutions and relevant public policies, including minimum wages, wage subsidies, and earned income tax credits.

CED 6080. Commerce, Institutions, and Innovation. 4 Hours.
Examines the impact of institutions and innovation upon commercial activity. Commerce comprises the institutional (economic, political, and social) structures that allow private enterprises to meet society's demand for goods and services. Begins with the history of commerce, focusing on the key capitalist institutions—markets, property rights, firms, efficiency, regulation—and analyzing economic development.

CED 6090. Cultural Economic Development. 4 Hours.
Examines the role of markets in art, culture, and entertainment in economic development. Includes topics such as the role of the creative economy in attracting tourists and industry and in driving economic growth and the strategic impact of a creative export sector. Explores additional topics such as an analysis of the economics of historic preservation and tourism—for example, rehabilitating historical buildings, funding museums and symphony orchestras, and encouraging traditional arts and tourist activities—to lead job growth and spur economic vitality.

CED 6100. Economic Growth and Development. 4 Hours.
Addresses the economics of balancing development and equity in the context of meeting current and future human needs. Considering challenges and strategies in both developed and developing economies, this course begins with the issue of income inequality and poverty in economic development and explores the competing models of economic development, technological advancement, and population growth.

CED 6110. Law and Economics. 4 Hours.
Addresses topics such as property rights, regulation, income distribution applied to health and safety, the environment, the legal services and insurance industries, and zoning and land use. Includes additional topics such as new digital information products, international piracy, and intellectual property protections and created issues.

CED 6120. Environmental Economics. 4 Hours.
Examines the role of institutions and innovation upon commercial activity. Commerce comprises the institutional (economic, political, and social) structures that allow private enterprises to meet society's demand for goods and services. Begins with the history of commerce, focusing on the key capitalist institutions—markets, property rights, firms, efficiency, regulation—and analyzing economic development.

CED 6130. Sustainable Economic Development. 4 Hours.
Examines the role of institutions and innovation upon commercial activity. Commerce comprises the institutional (economic, political, and social) structures that allow private enterprises to meet society's demand for goods and services. Begins with the history of commerce, focusing on the key capitalist institutions—markets, property rights, firms, efficiency, regulation—and analyzing economic development.

CED 6140. Economic and Environmental Policy. 4 Hours.
Examines the role of institutions and innovation upon commercial activity. Commerce comprises the institutional (economic, political, and social) structures that allow private enterprises to meet society's demand for goods and services. Begins with the history of commerce, focusing on the key capitalist institutions—markets, property rights, firms, efficiency, regulation—and analyzing economic development.

CED 6150. Applied Microeconomics. 4 Hours.
Explores the microeconomic theory required to apply the leading literature and develop models to explain behavior of households, firms, and markets, as well as to evaluate economic policy. Various elasticity concepts and applications, theories of demand and production, and derivation of cost curves comprise the core theory for this course. Presents analyses of pricing and output behavior in the several market structures with the allocation of welfare and the pricing of resources.

CED 6160. Advanced Macroeconomics. 4 Hours.
Presents several theoretical approaches to short-run economic instability and long-run growth. Uses conceptual and mathematical tools to examine the major determinants of fluctuations in employment and price level, as well as the rate of economic growth. The study of inflation and unemployment and the interaction of the product, financial, and labor markets are at the core of this course. From this foundation, theoretical models are used to evaluate monetary and fiscal policy approaches and tools.

CED 6170. Advanced Mathematics and Statistics for Economics. 4 Hours.
Seeks to meet the practitioners' needs for applied research and analysis. Offers students an opportunity to develop and reinforce mathematics tools and basic probability, descriptive statistics, estimation techniques, statistical hypotheses, sampling, analysis of variance, correlation, and regression analysis in the context of economics. Computer applications are an integral part of the course and support theoretical and applied analysis required for professional development.

CED 6180. Advanced Econometrics. 4 Hours.
Depicts the application of econometrics, the primary research method used by practicing economists. Addresses topics such as applied economic problems, modeling framework, data collection, estimation techniques, and interpretation of results.

CED 6190. Advanced Commerce and Economic Development. 4 Hours.
Introduces the fundamentals of commerce and economic development and policies designed to spur commercial activity and target growth. Information, institutions, and innovation are added to basic neoclassical economic models of markets and development in order to frame consideration of different rates of growth, technological advance, and industrial change. Offers students an opportunity to learn how to apply microeconomic and macroeconomic models, as well as different theoretical perspectives, to evaluate important local and global public policy issues of importance.
COMM 1000. Communication Studies at Northeastern. 1 Hour.
Designed to provide a unique opportunity to engage faculty, professional staff, and peer mentors in small group discussions. Introduces students to the College of Arts, Media and Design. Offers students an opportunity to learn about the communication studies major and to explore the different areas of emphasis offered by the department. As part of the course, students are expected to prepare a detailed plan of study and are introduced to the co-op program and meet their academic co-op advisor.

COMM 1101. Introduction to Communication Studies. 4 Hours.
Surveys the field of communication studies. Covers major theories and methodological approaches in communication studies and situates communication within larger social, political, and economic institutions. Exposes students to ways of ethical reasoning across communication contexts, including organizational communication, social media, intercultural communication, mass media, and interpersonal communication.

COMM 1112. Public Speaking. 4 Hours.
Develops skills in public communication. Topics include choosing and researching a topic, organizing and delivering a speech, handling speech anxiety, listening critically, and adapting language to an audience. Offers the opportunity for students to present a series of speeches and receive advice and criticism from an audience.

COMM 1113. Business and Professional Speaking. 4 Hours.
Designed to assist students in developing advanced public speaking and presentational skills for professional and leadership positions. Covers fundamentals such as audience, speech objectives and structure, and effective delivery. Emphasizes the production and successful interaction with electronic and traditional supportive media. Offers students an opportunity to develop their presentational skills in a variety of settings and realistic business tasks.

COMM 1120. Principles of Argumentation. 4 Hours.
Considers how the theories and techniques of argumentation can be used to understand and promote differing points of view, explore ideas and alternatives, and convince others of the need to change or act. Starts with the principles of formal logic and introduces students to truth tables and diagramming techniques. Continues to discuss informal logic and modern argumentation theory, including argumentative reconstruction, argument structures, argument schemes and critical questions, as well as informal fallacies. Concludes with a discussion of the effective use of reasoning in society from a logical, dialectical, and rhetorical point of view.

COMM 1125. Science, Communication, and Society. 4 Hours.
Introduces the major areas of research analyzing the role of communication and the media in shaping debates over science, technology, and the environment. Focuses on what U.S. National Academies calls the “science of science communication” to offer students an opportunity to acquire the knowledge necessary to assess the interplay between science, engineering, and society, including the implications for strategic communication, public engagement, personal decisions, and career choices. Examines the scientific, social, and communication dimensions of debates over climate change, evolution, human genetic engineering, childhood vaccination, food biotechnology, and other case studies. Covers how to find, discuss, evaluate, and use expert sources of information; to formulate research questions and expectations; to think effectively about professional situations and choices; and to write evidence-based, persuasive papers and essays.

COMM 1131. Sex, Relationships, and Communication. 4 Hours.
Focuses on communication as it occurs in sexual and romantic relationships, specifically on the positive and negative role of verbal and nonverbal communication in these relationships. Topics may include the role of communication in interpersonal attraction, attachment, affection, love, sex, and relational duration and outcomes. May also introduce communication in other types of relationships, such as family and/or friendship, as points of comparison. Encourages students to explore the central place of communication in all aspects of sexual and romantic relationships and how communication may help them derive maximum social rewards.

COMM 1210. Persuasion and Rhetoric. 4 Hours.
Seeks to teach students to be more astute receivers and producers of persuasive messages by learning how to dissect them. Examines both classical and contemporary theories of persuasion, after which students consider “persuasion in action”—how persuasion is used in everyday language, nonverbal communication, sales techniques, politics, and propaganda. Ethical issues in persuasion are addressed throughout the course.

COMM 1225. Communication Theory. 4 Hours.
Explores communicative and cultural practice from a wide variety of theoretical perspectives. Considers a wide range of cultural practices, texts, and artifacts, including popular culture (television shows, movies, and video games); social media and online content; as well as organizational communication (press releases) and interpersonal interactions (conversations between romantic partners). Communication theory is based on two premises: Our cultural assumptions inform and shape our ability to communicate; and communication is the process through which culture is created, modified, and challenged.

COMM 1231. Principles of Organizational Communication. 4 Hours.
Surveys the communication process in complex organizations. Topics include the evolution of organizational communication, communication networks, information management, and communication climate. Analyzes case studies and teaches how to improve the quality of communication in an organization.
COMM 1255. Communication in a Digital Age. 4 Hours.
Covers digital communication’s history, technical basis (“protocol” and the “Web”), communicative effects, commercial applications, culture, and societal interactions. Digital communication is central to contemporary life and is (consequently) often taken for granted, which this course seeks to remedy. Applies practical skills relative to theories about collaboration and cultural production and engagement with and analyses of online cultures. Offers students an opportunity to become effective online communicators—using practical exercises such as email filtering, online collaboration, and writing in a Web markup format—and to make use of critical thinking to understand and engage with issues such as online privacy, gender and racial bias, and marketplace credibility and fraud.

COMM 1310. Classical Foundations of Communication. 4 Hours.
Reviews the foundations of the field of speech and communication in ancient Greece and Rome. Topics include Aristotle’s ideas about persuasion, the sophistic tradition, the rhetorical theories of Cicero and Quintilian, and famous speeches of the golden age of Greece and Rome. Employs classical rhetorical theory as a mode of critical thinking and public involvement to study the processes of argumentation and persuasion in various interpersonal, political, academic, and pop culture settings.

COMM 1331. Legal Argumentation, Advocacy, and Citizenship. 4 Hours.
Seeks to train students to become community leaders, provide students with the tools for effective participation in national and local politics, and prepare students for careers in which persuasive skills are critical to success. Offers an opportunity to study historical documents to understand the processes of argumentation and to develop arguments by performing detailed research about contemporary issues.

COMM 1412. Social Movement Communication. 4 Hours.
Examines the communication strategies (including rhetorical messaging, public advocacy, grassroots organizing, fund-raising, and media outreach) of historical and contemporary advocacy groups, movements, and organizations. Social movements considered may include immigration protests, AIDS activism, environmental advocacy, disability movements, and animal-rights “terrorism.”.

COMM 1414. Great Speakers and Speeches 1, 1630–1930. 4 Hours.
Reviews notable U.S. orations of the period between 1630 and 1930, with an emphasis on speeches that were given after the American Revolution. Topics covered include the nature of public address and its importance in U.S. history; the role of the critic in studying public address; and genres of oratory, including inaugural speeches, apologies, and political movement oratory.

COMM 1511. Communication and Storytelling. 4 Hours.
Engages students in the discovery of varied and culturally diverse texts in the literary genres of poetry, prose, and drama. Students focus on analyzing an author’s meaning and communicating that meaning to an audience through interpretive performance.

COMM 1600. Communication Ethics. 4 Hours.
Focuses on ethical principles, issues, and dilemmas in communication. Covers professional codes as well as personal, interpersonal, small group, organizational, and societal factors affecting ethical mediated communication. Designed to stimulate the moral imagination, reveal ethical issues inherent in communication, and provide resources for making and defending choices on ethical grounds.

COMM 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

COMM 2010. Social Networks. 4 Hours.
Explores the use of social network analysis theories and methods to understand the growing connectivity and complexity in the world around us on different scales, ranging from small groups to the World Wide Web. Offers students an opportunity to see the world in a new way: using a network perspective. Covers a wide range of topics and applications relating to social network analysis. Discusses how social networks concepts, theories, and visual-analytic methods are being used to map, measure, understand, and design a wide range of phenomena such as groups and organizations, friendships and romantic relationships, social networking sites (Facebook), recommender systems (Amazon), online games and virtual worlds (Second Life), and the World Wide Web.

COMM 2301. Communication Research Methods. 4 Hours.
Offers an overview of the concepts, methods, tools, and ethics of communication research. Introduces students to the basic statistical concepts used by communication researchers. Designed to help students become knowledgeable consumers and limited producers of communication research. Offers students an opportunity to learn to read, interpret, and critically evaluate research reports. Exposés students to basic social science concepts and research designs and the fundamentals of conducting and analyzing research using surveys, experiments, and content analyses. Students conduct their own empirical research study as a final project, which entails research design, data collection, data analysis, and a written presentation.

COMM 2303. Global and Intercultural Communication. 4 Hours.
Focuses on theories of and approaches to the study of intercultural communication. Emphasizes the importance of being able to negotiate cultural differences and of understanding intercultural contact in societies and institutions. Stresses the benefits and complexities of cultural diversity in global, local, and organizational contexts.

COMM 2304. Communication and Gender. 4 Hours.
Presents a theoretical and practical examination of the ways in which communication is gendered in a variety of contexts. Integrates into this analysis how different institutions and interpersonal situations affect our understanding of gender roles. COMM 2304 and WMNS 2304 are cross-listed.

COMM 2312. Voice and Articulation. 4 Hours.
Provides training in developing clear and articulate speech. Topics include the physiology of the vocal mechanism, voice projection and variety, articulation and pronunciation, and appropriate speech. Trains students through lectures, drills, and exercises.
COMM 2350. Producing for the Entertainment Industry. 4 Hours.
Investigates the role of the producer in the production of content for traditional and new media venues. Explores a variety of distribution systems, including online channels, mobile video, terrestrial/satellite radio, documentary film, and independent films, among other platforms. Examines the producer’s role in story conceptualization, budget planning, preproduction, and marketing. Through a series of discussions, screenplays, homework writing assignments, and in-class writing workshops, offers students an opportunity to gain the skills to produce commercially viable content.

COMM 2402. Presentation, Style, and Professional Communication. 4 Hours.
Develops students’ understanding and skills in presentation beyond public speaking. The integration of display technologies to accompany talks and presentations is expanded in this course. Comprises further conceptual and applied work on matching institutional objectives to presentation and presentation goals.

COMM 2450. Sound Production for Digital Media. 4 Hours.
Designed to prepare students to work with audio in modern media settings. Introduces the process of planning, preparing, producing, and evaluating audio production styles and techniques. Through a series of discussions, screenings, homework, and in-class exercises, offers students an opportunity to gain the skills needed to produce successful audio recordings. Exposes students to the elements and terminology of audio production as they record, mix, and produce their own original projects.

COMM 2451. Sports Broadcasting. 4 Hours.
Develops and refines skills in the art of sportscasting. Students are given an historical perspective and a state-of-the-art analysis. Emphasis is on practical development of skills and evaluation of talent and potential. Areas of study include play-by-play announcing, interviewing, reporting, writing, and anchoring.

COMM 2454. Broadcast Management and Programming. 4 Hours.
Examines television industry strategies for creating content, increasing revenue, and designing innovative distribution systems to reach increasingly elusive audiences. Studies what tactics and strategies networks are using to leverage the power of prime-time programs; the opportunities and challenges for networks in producing quality online content; and how TV programmers can engage audiences through "second screens" and social TV apps. Analyzes the external influences on programming, including the sway of advertisers, government regulations, self-regulation, and FCC rulings. Investigates economics, marketing, promotion, advertising, media research groups, and audience ratings across digital platforms. Through a series of discussions, screenings, homework writing assignments, and in-class writing workshops, offers students an opportunity to gain the skills to produce commercially viable television shows.

COMM 2501. Communication Law. 4 Hours.
Introduces the fundamental principles of communication law and ethics. Explores the complex interplay between law (the First Amendment) and ethics (personal and professional responsibilities). Topics covered include blasphemy, commercial speech, copyright, defamation, fighting words, free press/fair trial, hate speech, heresy, incitement, obscenity, political speech, pornography, prior restraint, public forums, special settings (such as schools, prisons, and the military), symbolic speech, threats, and time-place-manner restrictions. Emphasizes ethical issues involving privacy, accuracy, property, and accessibility. The transcendent question in communication law and ethics is whether it is right to exercise the rights granted communication professionals under the First Amendment.

COMM 2531. Application of Organizational Communication. 4 Hours.
Examines the problems of sending and receiving information in complex organizations. Reviews technologies used to disseminate information, communication auditing processes, and methods to devise and assess communication programs for organizations.

COMM 2551. Free Speech in Cyberspace. 4 Hours.
Examines the extension of communication law to the Internet, assesses a range of pending proposals designed to regulate free speech in cyberspace, and discusses a variety of national and international schemes intended to govern the developing global information infrastructure. Considers free speech (political speech, sexually explicit expression, and defamation); intellectual property (trademark and copyright); and emerging issues (privacy, unsolicited commercial email or spam, schools, and international law). Does not cover issues related to electronic commerce or contracts, gambling, personal jurisdiction, or Internet taxation.

COMM 2555. Games for Change. 4 Hours.
Offers students sound introduction to the psychological and behavioral theories of entertainment media with the goal of implementing these theories to the future design and evaluation of games for change. Focuses more on the psychological, behavioral, and social aspects of video games than on pure technical aspects. Organized around a collection of selected readings and real-world games and discussions. The final project is based on reflective thinking, critical evaluation, and creative application. COMM 2555 and GAME 2555 are cross-listed.

COMM 2650. The Business of Entertainment. 4 Hours.
Examines business issues associated with the entertainment industry. Through lectures, guest lectures, and case studies, introduces students to financing, contracts, intellectual property issues, licensing, product placement, marketing and publicity, ratings, the impact of piracy, understanding and leveraging new technologies, and distribution. Offers students an opportunity to master these concepts by organizing into teams and developing an original entertainment industry business product or services. Requires each team to develop a formal business plan that includes a market analysis, a budget, and a marketing plan.

COMM 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

COMM 3200. Mobile Communication. 4 Hours.
Introduces students to the landscape of mobile communication technologies. Takes a broad view of what "mobile," “communication,” and “technology” mean in the past, present, and future, encompassing a range of digital and nondigital objects as well as technological and communicative practices. Covers core concepts and theories in mobile communication, focusing on the impact that mobile hardware and software have on society, culture, and politics.

COMM 3201. Health Communication. 4 Hours.
Explores various topics as they relate to health communication including interpersonal aspects, cultural issues, and political complexities of health. Subject matter includes patient-provider communication, organizational systems, advertising in the health industry, and the role of media in the formation of expectations about health and the use of media to promote social change.
COMM 3230. Interpersonal Communication. 4 Hours.
Offers an overview of the theory and practice of interpersonal communication with the goal of developing the knowledge and skills to create dialogue in conversation, work through conflict, adapt to change, and establish/maintain relationships. Topics include definitions of the communication process, identity, self-disclosure, verbal and nonverbal language, listening, management of interpersonal conflict, and relational and dialogic communication.

COMM 3304. Communication and Inclusion. 4 Hours.
Explores theoretical and practical issues in the relationships between communication, social identity, and social inclusion. Focuses on how communication shapes perceptions and positions of salient social identity groups and how individuals and groups resist and transform identity and promote inclusion through communication. Specifically focuses on communication and inclusion in the contexts of gender, race, sexual identity, social class, ability, and age. Course topics cover a range of theoretical and practical issues, including diversity in organizational settings and the social construction of identity. COMM 3304 and WMNS 3304 are cross-listed.

COMM 3306. International Communication Abroad. 4 Hours.
Applies communication theory and practice to a wide range of documents, artifacts, museums, and landmarks. Available to students participating in a Dialogue of Civilizations sponsored by the Department of Communication Studies. Content is adapted by the faculty depending on the location of the class. For example, students may study the classical foundations of communication and contemporary political discourse in Athens or British history and documentary film production in London. Often includes meetings with foreign professors, government officials, community organizers, and local artists that have shaped their own country in unique and innovative ways. May be repeated without limit.

COMM 3307. Production Practicum Abroad. 4 Hours.
Combines the process of filmmaking with exploring Britain’s multicultural society, offering students an opportunity to obtain firsthand experience to develop a deeper, more complex understanding of the culture, particularly as it is evident in London. Covers all aspects of field production from the preproduction process of intensive research and development of story ideas to the technical aspects of filming, lighting, sound recording, digital editing, and graphics. Students work with remote video equipment that includes HD cameras, audio, and remote editing equipment. Taught in London.

COMM 3320. Political Communication. 4 Hours.
Reviews the construction and influence of rhetoric in political campaigns, particularly contemporary presidential campaigns. Also studies the impact of mass communication on the outcome of elections. Offers students an opportunity to analyze artifacts from recent political campaigns such as stump speeches, campaign debates, campaign advertising, and formal campaign speeches such as nomination acceptance addresses, concession and victory speeches, and inaugural addresses.

COMM 3330. Argumentation Theory. 4 Hours.
Studies the conditions of successful and valid human reasoning as manifested in its products (arguments) and procedures (debates and critical discussions). The first half of the course explores the ethical and structural fundamentals of argumentation, including its main theorems regarding argument schemes and critical questions, argument structures and reconstruction, and fallacies and felicity conditions of valid reasoning. The second half engages contemporary trends in argumentation studies, including the formalization of arguments and its diagramming for artificial intelligence, the contextualization in different societal domains (politics, health, private and public discourse), and the translation of argument theory into pedagogical practice.

COMM 3331. Argumentation and Debate. 4 Hours.
Introduces the principles and skills of effective argument. Topics include the process of advocacy, how to develop an argument through reasoning, the psychology of argument, and motivational techniques of argumentation. Combines theory and practice in argument through individual presentations and team debates.

COMM 3400. Rhetoric of Science. 4 Hours.
Explores the “rhetoric of science,” which since the 1980s has organized intellectual energies and managed disciplinary anxieties. The animating insight of rhetoric of science work is that the discourses, methods, boundaries, and genres of science do not just feature hallmarks of persuasive activity but are thoroughly rhetorically constituted.

COMM 3409. Advocacy Writing. 4 Hours.
Offers an Advanced Writing in the Disciplines (AWD) course. Dedicated to teaching students to write scholarly arguments in the discipline of public advocacy and rhetoric and to translate that work for a general audience. Features both an academic approach to writing in the field of rhetoric and a practical approach to writing persuasively for general audiences.

COMM 3414. Great Speakers and Speeches 2, 1930–Present. 4 Hours.
Reviews significant moments of oratory from 1930 to the present, assessing them in the historical context in which they occurred. Offers students an opportunity not only to understand the way that history prompts public discourse and how that discourse shapes history but to learn critical approaches to better understand the rhetoric of this period. Emphasizes the analysis of rhetorical texts but adds to it the contemporary dimensions of sound and images.

COMM 3415. Communication Criticism. 4 Hours.
Offers students an opportunity to deepen their abilities to think critically about texts in a variety of forms such as orations, advertisements, music, and art. Studies methods that may range from close textual analysis to deconstruction to theories of performance. Students are required to write a lengthy research paper that carefully analyzes a rhetorical object.

COMM 3445. Public Relations Principles. 4 Hours.
Presents the principles, history, and methods of public relations; processes of influencing public opinion; responsibilities of the public relations practitioner; and analyses of public relations programs. Through case studies and class discussions, offers students an opportunity to confront real-life ethical dilemmas and learn to apply ethical frameworks to evaluate and resolve them. COMM 3445 and JRNL 3425 are cross-listed.
COMM 3450. Voice-Over Artist. 4 Hours.
Introduces voice-over acting techniques for TV commercials, radio, multimedia, and various styles of presentation for both audio and video projects. Offers students an opportunity to uncover and develop their vocal range as narrator, announcer, character, and spokesperson with effectiveness and emotional authenticity. Covers both the “business” and the technical aspects of being a voice talent. Includes the use of microphones, headphones, and recording equipment while in our audio lab. Studies the essentials of vocal techniques, studio etiquette, and working with direction during a studio session.

COMM 3451. Advertising Practices. 4 Hours.
Examines the development, procedures, economic functions, and responsibilities of advertising. Explores planning, research, production, and other elements that go into successful advertising. Covers the preparation of advertising for print and broadcast media, including campaign planning, space and time buying, and scheduling.

COMM 3500. Environmental Issues, Communication, and the Media. 4 Hours.
Analyzes major debates over the environment, climate change, and related technologies such as nuclear energy, wind power, natural gas “fracking,” and food biotechnology. Studies the relevant scientific, political, and ethical dimensions of each case; the generalizable theories, frameworks, and methods that scholars use to analyze them; and the implications for effective public communication, policymaker engagement, and personal decision making. Offers students an opportunity to gain an integrated understanding of their different roles as professionals, advocates, and consumers and to improve their ability to find and use expert sources of information; assess competing media claims and narratives; write persuasive essays, analyses, and commentaries; and author evidence-based research papers.

COMM 3501. Free Speech: Law and Practice. 4 Hours.
Provides students with an opportunity to better understand freedom and limits to freedom, particularly in the realm of speech and expression. Materials covered range from the philosophy of freedom to historical legal cases about free speech and the press to political correctness and the repression of dissent.

COMM 3530. Communication and Sexualities. 4 Hours.
Analyzes the ways in which sexualities intersect with issues relating to interpersonal communication, mediated communication, popular culture, identity, and social movements. Discusses outing, media representations, queer identity development, and the HIV/AIDS epidemic. Covers theoretical perspectives from communication and other social science disciplines, gender and sexuality studies, and cultural studies.

COMM 3534. Group Communication. 4 Hours.
Instructs in small group decision-making processes, problem solving, and the interpersonal dynamics of groups. Develops skills in working with and in a variety of small groups. Topics include communication dynamics, systems thinking, dialogue, conflict management, leadership, power, teams, and learning organizations.

COMM 3550. Television Field Production. 4 Hours.
Offers advanced training in video production techniques, emphasizing remote location shooting. Includes location scouting, production budgets, writing techniques, equipment location, postproduction editing, and content analysis. Covers the fundamentals of single-camera field production and the nonlinear editing process. Offers students an opportunity to work in teams to produce and direct television using remote video equipment.

COMM 3610. Communication, Politics, and Social Change. 4 Hours.
Examines the place of race, gender, and sexual identity in American politics and public discourse. Emphasizes the role of communication in public attitudes toward identity, the role that identity plays in electoral politics, and how public policy and social change are made. Explores how public debate on issues related to identity influences how Americans think about the rights and place of minorities in society.

COMM 3625. Public Relations Practice. 4 Hours.
Demonstrates practices and techniques employed in the field including organization of events and functions. Studies campaign planning, research, and media relationships. COMM 3625 and JRNL 3625 are cross-listed.

COMM 3627. Critical Thinking about Public Relations Strategies. 4 Hours.
Designed to bring together upper-level students from multiple disciplines who are interested in taking a microscopic view of how issues are purposefully driven by professionals interested in promoting causes, political candidates, public policy, and corporate image. Examines how corporations and others make decisions and which theories of institutional behavior best explain those choices. Are companies motivated solely by economics as Marx would argue, or do they approach their image in a more functional way? Are the messages of politicians determined by race and class, or do they respond to a different framework? Requires students to follow current issues and dissect significant past campaigns. Knowledge of public relations tactics is helpful but not necessary. COMM 3627 and JRNL 3627 are cross-listed.

COMM 3650. Television Studio Production. 4 Hours.
Introduces the process of planning, preparing, producing, and evaluating studio productions. Exposes students to the elements and terminology of studio production using multiple cameras, live switching, audio mixing, and studio lighting. Through a series of discussions, screenings, homework, and in-class exercises, offers students an opportunity to obtain skills in the basics of directing creative and technical talent and the skills needed to produce successful television studio productions.

COMM 3750. Special Effects and Postproduction for Television. 4 Hours.
Explores a variety of techniques to make special effects for film, video, and the World Wide Web. Offers students an opportunity to utilize cutting-edge technology and to apply state-of-the-art techniques to design and produce innovative special effects. Explores historical, technical, and theoretical aspects of special effects. Topics covered include compositing, matte painting, multiplex animation, explosions, smoke, three-dimensional lighting, particle emitters, chroma keying, motion graphics, video tracking, and more.
COMM 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

COMM 4102. Health Communication Campaigns. 4 Hours.
Offers an in-depth look at how persuasive health campaigns are designed and executed. Discusses how campaigns are designed to intentionally influence awareness, knowledge gain, and attitude/behavior change. Offers students an opportunity to obtain skills to design and evaluate campaigns through the completion of their own campaign projects and to learn about visual and verbal arguments and the unique ethical and other considerations of health campaigns.

COMM 4131. Sex and Interpersonal Communication. 4 Hours.
Builds on health and interpersonal communication courses. Offers students an opportunity to explore interpersonal communication and its relation to sex and romance. Explores how overarching structures regarding sex influence the interpretation of modern social issues. Investigates major research on emerging contemporary topics as they relate to the study of sex and interpersonal communication. Focuses largely on topic areas including deception, divorce, political life of children, eugenics, and HIV/AIDS advancements.

COMM 4350. Communication and Quality of Life. 4 Hours.
Seeks to further develop an understanding of the function of communication in life and how that relates to quality of life. Examines the communicative experiences of organizations and relationships using both theoretical approaches and practical experience. Students participate in activities designed to develop knowledge and skills necessary to successfully analyze and address ethical and interpersonal communication issues. Offers students an opportunity to be able to reflect on and assess one’s own competence in communication and how one’s communication affects one’s quality of life and to respectfully consider the ethical complexities of quality-of-life issues in both organizational and interpersonal settings.

COMM 4530. Consultation Skills. 4 Hours.
Introduces the theoretical frameworks necessary to engage in a broad range of consulting activities (management consulting or organizational training and development). By studying nonprofit organizations in the Boston area, offers students an opportunity to learn how to gather and analyze data, to use mathematical methods to perform critical analysis, and to evaluate and critique choices made in the presentation of data. Requires students to make a formal report to the organization and to write a paper reflecting on the organization and its mission in the context of broader social, political, and economic issues. Emphasizes ethical considerations involving security, privacy, and fairness.

COMM 4534. Organizational Communication Training and Development. 4 Hours.
Introduces both theoretical frameworks and practical strategies for developing organizational training and development (i.e., instructional communication skills). Specifically examines contemporary approaches to teaching and training activities. Uses a service-learning project to help in the application of both theoretical understandings as well as the development of practical skills.

COMM 4535. Nonverbal Social Interaction. 4 Hours.
Offers analytic insight on methods people use to communicate different types of social action through body language. Much of our communication is nonverbal, as it is through our body language that we initiate new relationships (both personal and professional) and communicate anger, frustration, happiness, and grief. Offers students an opportunity to develop an understanding of the tools needed to examine the role nonverbal behaviors (body orientation, gaze direction, gesture, laughter, etc.) have in conveying meaning and constructing and negotiating interpersonal relationships. This course incorporates materials from communication, psychology, anthropology, and sociology.

COMM 4602. Contemporary Rhetorical Theory. 4 Hours.
Studies theories for analyzing language, image, and sound and their relationship to culture. Methods covered range from traditional rhetorical theorists to modern philosophers of media and culture. Expect students to select an artifact and analyze it from a variety of theoretical perspectives.

COMM 4603. Advocacy Workshop. 4 Hours.
Designed to engage students in a project that directly benefits local nonprofit organizations. Using the service-learning model, offers students an opportunity to gain the skills needed to effectively advocate for a cause and then actively participate in public service. Students are expected to write public advocacy policies that are tailored to the organization’s needs, to meet with state legislators to advocate for the disadvantaged, and to create media plans and pitch news articles to publicize their efforts.

COMM 4605. Youth and Communication Technology. 4 Hours.
Examines how meanings of “youth” and “communication technology” shift in relation to one another and to broader changes in society, culture, politics, and the economy over time. Examines how communication technologies (and the content they deliver) positively and negatively affect the social, emotional, and cognitive development of young people and how these changes are influenced by the particular family, school, community, and institutional contexts in which children grow up. Examines how young people differ individually across the life span as well as collectively by class, race, ethnicity, nationality, gender, sexuality, and disability. Requires a final paper at the end of the term in which students articulate and defend positions about youth and communication technology.

COMM 4608. Strategic Communication Capstone. 4 Hours.
Offers students an opportunity to complete a semester-long, intensive research and writing capstone project related to the field of strategic communication. Research topics can span business, politics, advocacy, entertainment, public health, the environment, and other societal sectors. Building on previous course work, students have an opportunity to gain a deeper scholarly and professional understanding of strategic communication; cultivate professional and academic contacts; and demonstrate mastery of relevant theoretical concepts, professional principles, research methods, and writing approaches. Encourages students to share and translate their findings for relevant academic and professional communities.

COMM 4625. Online Communities. 4 Hours.
Considers the question of whether or not online communities are “real.” Scholars conclude they are real, describing how people share enduring activities, identity, and relations online. Covers related issues of online communities, including formation, governance, conflict, and exit. Offers students an opportunity to obtain an understanding of community and how this relates to topics such as behavior, identity, and language online. Reviews contemporary issues and concerns. Engages the question and practice of what it means to develop and maintain a successful online community.
COMM 4630. Assessment Technique and Planning. 4 Hours.
Centers on creating and administering diagnostic tools used to assess the quality of communication in organizations. Students review measurement techniques, test organizational communication quality in simulated situations, and design programs intended to improve the quality of communication in organizations.

COMM 4631. Crisis Communication and Image Management. 4 Hours.
Examines theories, models, and strategies related to crisis communication and establishes ethical principles regarding what, how, and when essential elements must be employed for effective and ethical crisis communication. Offers students an opportunity to learn how to distinguish between an incident and crisis; to analyze communication practices and methods applied during a crisis; to apply social scientific theory to explain how and why a crisis occurred; and to draw upon theory to develop effective crisis communication plans. Assesses responses to crises using ethical principles such as transparency, two-way symmetrical communication, and timing. Designed to prepare communication professionals who appreciate the need for responsible advocacy when responding to crises.

COMM 4650. Digital Editing for TV. 4 Hours.
Addresses the changes in editing practices through digitization and offers students advanced training in nonlinear editing utilizing Avid Media Composer. Introduces the terms and concepts of nonlinear editing as well as the technical/creative aspects of postproduction. Students are expected to have a working knowledge of digital video equipment and Macintosh computer skills.

COMM 4750. Advanced Digital Editing for TV and Film. 4 Hours.
Introduces Media Composer effects and seeks to prepare students for real-world editing sessions. Covers intermediate audio and video-editing techniques, nesting effects, video layering, and features from the 3D-effect palette. Students should be comfortable working in a nonlinear editing environment and have a clear understanding of the basic features on Media Composer, as well as practical experience in audio mixing, nonlinear editing, and working with third-party graphics.

COMM 4901. Seminar in Communications. 4 Hours.
Integrates students' experiences in cooperative education with classroom concepts and theories. Topics include integrative learning, the field of communication, pathways and careers in communication, and the professional communicator. Offers students the opportunity to demonstrate competency in communication skills such as oral reporting, conducting research in communication, and writing.

COMM 4912. Special Topics in Communication Studies. 4 Hours.
Offers a special topics course in communication studies. Course content may vary from term to term. May be repeated up to four times.

COMM 4916. Organizational Communication Practicum. 4 Hours.
Focuses on internal newsletters, department brochures, and electronic and conventional bulletin boards, some of the methods that organizations use to communicate with their internal audiences. This practicum requires that students serve as designers and creators of communication instruments to be used in the Department of Communication Studies. Interested students must complete an application in the department office. May be repeated without limit.

COMM 4918. Special Topics in Communication Studies. 4 Hours.
Examines communication issues that are not addressed in course length in any existing courses. Content varies from term to term. Topical issues, specific student interest, and faculty/visiting faculty expertise can determine the substance of any individual offering of this course. May be repeated up to four times.

COMM 4940. Special Topics in Media Production. 4 Hours.
Addresses the emerging developments in the production of television, film, and video. Course content may vary from term to term. May be repeated up to four times.

COMM 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student's major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

COMM 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

COMM 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

COMM 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

COMM 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

COMM 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

COMM 4994. Internship in Communication. 4 Hours.
Offers students the opportunity to gain hands-on experience in the communications industry. Further internship details are available in the department office. May be repeated without limit.

COMM 4996. Experiential Education Directed Study. 4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using the course to fulfill their experiential education requirement. May be repeated without limit.

COMM 5200. Theories and Practices in Communication, Media, and Cultural Studies. 3 Hours.
Examines the foundational concepts underlying cultural studies with an emphasis on critical theories of the media and communication practices. It is intended to provide an understanding of how cultural studies approaches developed and evolved, assessing the major theoretical interventions within historically specific conjunctions. Analyzes the means through which power and hegemony are established and maintained in contemporary society, the alignment of culture and ideology, representation and the role of the media in the construction of social identities, and issues of global media and transnational communication in the contexts of postcolonial politics and postmodern thought.

COMM 5225. Cultural Studies of Everyday Life. 3 Hours.
Examines key theories and approaches to popular culture and the intersection of media and culture formations. Encourages students to explore the textual construction of meaning and the negotiated processes of understanding “the everyday” as a contested site for political and social struggle. Aspects of the course offer innovative approaches to research methods and methodologies that include ethnographic and related analytical tools and strategies. Students have the opportunity to engage in an open-ended way with established and emerging academic approaches to the study of everyday life that are at the cutting edge of cultural and media studies.
COMM 5230. Representations of Race and Difference. 3 Hours.
Approaches race as central to our understanding of contemporary national, transnational, and global culture. Examines the construction and deployment of race and difference through a range of theoretical and methodological lenses that highlight the challenges of multicultural communications. In doing so, the course connects historical narratives and imagery of race to current representations, encouraging students to think critically about race and difference through a variety of media productions, including television, film, and music.

COMM 5235. Rhetorical Studies. 3 Hours.
Offers students the opportunity to examine contemporary trends in the study of rhetoric, with a focus on the emergence of critical approaches to the field.

COMM 5240. Global and Intercultural Media. 3 Hours.
Provides students with the opportunity to examine and review the variety of literature, theory, and practice associated with media in the global context. Offers students the chance to develop an understanding of the challenges involved in cultural production that crosses borders to redefine meaning and identity.

COMM 5252. Research Methods in Communications, Media, and Cultural Studies. 3 Hours.
Surveys the key research techniques in communication, media, and cultural studies. Emphasizes qualitative research techniques. Offers students an opportunity to identify key research methodologies that are relevant to their own research. The course also seeks to assist students to develop research questions and strategies in preparation for thesis writing.

COMM 5255. Visual Communication Culture. 3 Hours.
Examines theories of visuality and visual culture focusing on the analysis of images as texts. Explores some of the following issues to help students more fully understand images and the visual as a contested arena in which cultural meanings are constituted: the nature of representation, the construction of meaning, and the management of perception in and through image making; the organization of visual languages by institutions of meaning; the role of the viewer in the construction of image meanings and the rearticulation of these meanings into everyday lived culture.

COMM 5260. Media Production and Critical Theory. 3 Hours.
Blends theory and practice of media production. Examines the theoretical frameworks, production techniques, and aesthetic strategies of selected documentary films that explore social and/or political issues. Offers students an opportunity to complete a short documentary project of their own.

COMM 5262. Neo-Liberalism and Democracy. 3 Hours.
Examines the historical articulations of modern Euro-American democracy, its association with mercantilism and capitalism, and the rise of liberal governmental structures. Topics covered include Marxist and nationalist and fascist critiques of liberal capitalism, alternatives to democracy, economic liberalism, the Cold War, structured free market capitalism, and contrasting political and economic models.

COMM 5275. Cultural Industries. 3 Hours.
Examines the intersection of media studies and associated cultural formations within an interdisciplinary framework derived from political economy and institutional economics. Offers students the opportunity to develop a critical approach to analyzing how the prevailing structural arrangements associated with media production and culture in contemporary society play out and the alternative approaches that have been devised. It also seeks to provide students with a perspective on the development of cultural policy studies and its various typologies in national and global contexts.

COMM 5280. Audience Studies. 3 Hours.
Offers students the opportunity to examine contemporary trends in the study of audiences, with a focus on the emergence of critical approaches to the field drawn specifically from cultural studies theory.

COMM 5676. Media Production. 6 Hours.
Offers a final-year production option. Focuses on preparing a media production comparable to a master's thesis under supervision of a faculty committee.

COMM 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

COMM 7945. Media Project. 6 Hours.
Designed for students who want to link theories and concepts to a media production. Offers students an opportunity to prepare a media production comparable to a master's thesis under supervision of a faculty advisor and two committee members. The production work should explore key themes in mediated culture that form the basis for experimentation in the construction of meaning. The project advisor and committee members assess the project.

COMM 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

COMM 7976. Directed Study. 1-4 Hours.
Offers an opportunity to work with a nominated faculty advisor with a specialization in an acknowledged area of communication studies. Under instruction from the advisor, students have an opportunity to identify an area of study that combines theory and practice and, in association with the advisor, generate a course of study that includes detailed reading and writing projects in the area of specialization. Students are encouraged to develop projects based on areas of specialization that reflect expertise and interest. May be repeated without limit.

COMM 7978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

COMM 7990. Thesis. 6 Hours.
Offers final-year thesis option, undertaken at a standard that reflects master’s-quality research and writing at a sustained and original level, agreed by the student’s faculty supervisory committee. May be repeated without limit.

COMM 7996. Thesis Continuation. 0 Hours.
Provides students who require additional time beyond the one semester allocated with the opportunity to complete their thesis.

Communication Studies - CPS (CMN)

CMN 0251. Professional Speaking. 2 Hours.
Offers students an opportunity to prepare, deliver, and evaluate presentations. Focuses on a practice-oriented approach to speaking rather than rhetorical theory. Examines use and misuse of visual support and familiarizes students with tools for complementing presentations with visual support.
CMN 1100. Organizational Communication. 3 Hours.
Introduces psychological, sociological, and communication theories as they apply to organizational life. Offers students an opportunity to analyze the importance of effective communication for organizations in a rapidly changing environment. Topics include management and leadership, culture and change, diversity, conflict management, and employee engagement. Throughout the course, students are encouraged to examine their communication skills in the context of those competencies necessary in today's complex organizational environments.

CMN 1990. Elective. 1-4 Hours.
 Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CMN 2310. Professional Speaking. 3 Hours.
Emphasizes the practical skill of public speaking, including methods for overcoming presentation anxiety, and the use of visual aids to enhance speaker presentations. Offers students an opportunity to prepare for a variety of typical public speaking situations and to learn the basic principles of organization and research needed for effective message design and delivery.

CMN 2990. Elective. 1-4 Hours.
 Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CMN 3100. Negotiation. 3 Hours.
Introduces the techniques of dispute resolution. Focuses on the processes of mediation, facilitation, and negotiation. Through readings, lectures, and class activities, offers students an opportunity to explore methods of applying these skills to professional settings.

CMN 3220. Public Relations Basics and Practice. 3 Hours.
Introduces the concepts, components, and methods of public relations. Examines planning and research, the process of influencing public opinion, and policies concerning corporate and institutional relations with media and various publics. Offers students an opportunity to apply specific practices and techniques employed in the public relations field.

CMN 3330. Digital Communication and Organizations. 3 Hours.
Explores how rapidly changing digital communication impacts the ways in which individuals and organizations interact. Focuses on the history, present use, and newly emerging forms of digital communication. Offers students an opportunity to examine principles, practice with, and evaluate the effectiveness of a variety of digital communication media in selected contexts.

CMN 3340. Gender and Communication. 3 Hours.
Examines the personal and social aspects of gender and the role communication plays in our understanding of gender identities. Encourages students to examine their own attitudes toward gender and communication, especially in organizational contexts.

CMN 3350. Intercultural Communication. 3 Hours.
Focuses on gaining an advanced understanding of the concepts associated with culture and communication. Offers students an opportunity to develop intercultural awareness and patterns of perception and thinking to enable effective communication across cultural boundaries. Discusses the effect of cultural differences on communication styles, personal identities, and various organizational contexts.

CMN 3360. Crisis Communication. 3 Hours.
Introduces important implications of effective internal and external communication during crises. Examines proactive and reactive approaches to crisis communication from an academic and practical perspective. Considers elements of effective crisis communication plans and tactics. Offers students an opportunity to analyze several crisis situations.

CMN 3400. Advanced Organizational Communication. 3 Hours.
Examines communication as the center of organizational life. Includes a detailed overview of the field of organizational communication from classical theories to critical perspectives of organizational behavior. In the second half of the course, offers students an opportunity to apply this learning to analyze communication in a variety of contexts.

CMN 3990. Elective. 1-4 Hours.
 Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CMN 4220. Organizational Communication Measurement and Assessment. 3 Hours.
Offers students an opportunity to apply and extend learning from previous courses in organizational communication. Guides students in completing communication research. Through application assignments and project work, students are exposed to a variety of methods for conducting organizational communication research, gathering and analyzing data, and communicating results in a professional report.

CMN 4850. Capstone in Professional Communication. 3 Hours.
Seeks to guide students in developing a semester-length service-learning project that integrates theory, practice, creativity, and reflection explored throughout their communication studies. The project helps students deepen knowledge and extend ability within their chosen concentrations by having them analyze and apply what they have learned in pragmatic ways that enhance the learning experience, teach civic responsibility, and strengthen communities. Offers students an opportunity to create a portfolio of meaningful artifacts useful for career entry, development, and advancement in this writing-intensive course.

CMN 4896. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student's approved experiential activity and integrates it with study in the academic major.

CMN 4950. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

CMN 4955. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student's major field. May be repeated without limit.

CMN 4983. Topics. 1-4 Hours.
Examines a variety of subjects and themes in communication studies. Since topics change from term to term, students may take this course more than once, provided they focus on a different topic each time. May be repeated without limit.

CMN 4990. Elective. 1-4 Hours.
 Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CMN 4991. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

CMN 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.
CMN 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

CMN 4994. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

CMN 4995. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

CMN 5976. Directed Study. 1-4 Hours.
Offers students an opportunity to carry out an individual reading and research project under the supervision of a faculty member. The directed study format allows for the in-depth analysis of a particular topic not covered in-depth or the study of a subject not typically covered in the curriculum. A directed study proposal must be approved by the faculty sponsor, division head, and dean of academic affairs.

CMN 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

CMN 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

CMN 6000. Introduction to Organizational Communication. 2,3 Hours. 
Considers writing and other forms of communication as a management tool. Addresses how effective writing—in plain English—can shape project plans, motivate people, solve problems, and enhance one’s role as a communicator. Offers students an opportunity to demonstrate their writing and editing skills through research, case study analysis, and composing business-related communications as well as to develop other forms of communication, including oral presentations. As such, the two major goals of this course are to acquaint students with a step-by-step communication methodology and to provide them with an opportunity to develop and polish their writing and communication skills.

CMN 6010. Strategic Communication Management. 3 Hours.
Focuses on the rapidly evolving role of organizational communication in the digital era. Since audience expectations regarding transparency and responsiveness are changing dramatically, the course introduces students to stakeholder analysis and the theory and practice of persuasion. Managing communication strategies requires a strong foundation in communication planning methodology in order to design communication programs and initiatives that support organizational performance. Offers students an opportunity to gain an understanding of the evolving roles and responsibilities of communication functions addressing both internal and external audiences.

CMN 6015. Introduction to the Digital Era: The Power of Social Media. 3 Hours.
Introduces social media concepts, including the historical, economic, and social foundations of digital era realities. Explores the potential applications of new technologies for both internal and external purposes, across a range of organizations and industries. Explores strategic responsibilities, issues, and challenges in the context of social media leadership. Addresses digital era career-management responsibilities, including the need to establish a strong digital presence, stay current with changing technologies, and consider new and evolving positions and career trajectories. Offers students an opportunity to apply concepts by establishing and/or strengthening their own digital presence and professional brand, in addition to assessing the digital presence of relevant individuals and organizations.

CMN 6020. Ethical Issues in Organizational Communication. 3 Hours.
Examines ethical questions that directly affect how organizations communicate and what they choose to relay and omit to their various audiences. Organizational women and men are compelled to make ethical decisions when they communicate. Proponents of strategic ambiguity in and for organizations have been confronted and countered by other theorists who reject ambiguity as a euphemism for lying. Analyzes cases and academic studies that reflect how ethical and unethical communication affected the fortunes of organizations. Analyzes and evaluates the practical values of ethical yardsticks.

CMN 6025. Digital Era Skills: Platforms, Tools, and Techniques. 3 Hours.
Seeks to help students develop content and community management skills by focusing on specific tools, techniques, and best practices for effective engagement on both public and private platforms (including time and information management skills). Both individual and organizational success in the digital era depends on the development of these skills by professionals in a range of disciplines. Offers students an opportunity to apply concepts by experimenting with various tools and platforms and reflecting on lessons learned from their own active engagement and to learn from the experiences and reflections of their peers.

CMN 6030. Professional Speaking. 3-6 Hours.
Examines styles of speaking, methods for structuring addresses, and the use/misuse of visual support. Focuses on several types of interviews common within organizational settings, including performance appraisals, informational, and problem-solving interviews. The ability to deliver effective professional presentations is empowering. Emphasizes practical experience in delivering presentations and conducting interviews.

CMN 6035. Legal, Policy, and Ethical Issues in the Digital Era. 3 Hours.
Provides an overview of the challenges that need to be addressed from both commercial and employment law perspectives. Also covers general social concerns like privacy. Digital era leaders must understand the legal, policy, and ethical issues resulting from increased use of digital technologies and learn how to effectively manage the associated risks. Emphasizes managing organizational risks but also explores the impact of various legal considerations on individuals. The U.S. legal environment serves as the focal point; however, global issues are also addressed.

CMN 6040. Consumer Behaviors in the Online Environment. 3 Hours.
Explores important concepts about consumer behaviors in the online environments, including the social media environment and the electronic commerce (e-commerce) environment. Topics include consumer engagement with social media, electronic word of mouth (eWOM), branding and advertising issues in social media, methodological perspectives on social media, consumer expectations and online shopping preferences in the e-commerce environment, and public policy issues in social and digital media.

CMN 6045. Leveraging Digital Technologies: Strategy, Assessment, and Governance. 3 Hours.
Focuses on the initial stages of social media initiatives: strategy identification, assessment, and governance considerations. Offers students an opportunity to learn the importance of establishing goals and objectives to guide subsequent development and implementation efforts, how to evaluate the potential for digital technologies to enable the pursuit of those goals and objectives, and how to conduct a comparative assessment of current and potential tools and practices to identify the most efficient and effective approaches. Also offers an opportunity to develop an appreciation for the governance issues that have to be considered once a commitment to leveraging new technologies has been made.
CMN 6050. Crisis Communication. 3 Hours.
Examines crisis communication from the perspective of practitioners as well as academics. Both groups have examined accommodation as well as avoidance strategies for crisis communication. Crises are a fact of life in organizations. Natural disasters, sexual harassment charges, psychopathic acts, and product callbacks are a few situations that require intelligent communication to internal and external stakeholders. Includes analysis of several crisis-communication studies, including recommendations for “what I would have done instead.” Reviews the elements of an effective crisis communication plan and development of communication tactics for a range of stakeholder audiences.

CMN 6060. Negotiation, Mediation, and Facilitation. 3 Hours.
Introduces the techniques of dispute resolution. Emphasizes the processes of mediation, facilitation, and negotiation. Examines techniques suggested by practitioners and researchers regarding best practices for effective negotiation. A central part of the course requires students to participate in and evaluate negotiation simulations.

CMN 6061. Personal Branding. 3 Hours.
Examines the importance of developing a personal brand in today’s hyper-competitive marketplace. By engaging in a detailed self-assessment process, participants have an opportunity to clarify their skill sets, values, and career aspirations—the foundation of a personal brand. They then have an opportunity to focus on methods of conveying a consistent personal brand, including presentation skills, interviewing and networking skills, the use of social media, and involvement in targeted professional associations.

CMN 6065. Implementation and Management of Social Media Channels and Online Communities. 3 Hours.
Focuses on the implementation and management stages of social media initiatives. Offers students an opportunity to learn how to establish/expand an organization’s initial presence on multiple platforms, define metrics for measuring success in both the short and longer terms, develop training for community managers and others, evaluate the performance of social media activities and revise strategies/tactics to adapt to feedback, and determine logical approaches for expanding a digital community and developing specific campaigns based on community activity.

CMN 6080. Intercultural Communication. 3 Hours.
Discusses the impediments to effective intercultural communication and methods for overcoming these impediments. The ease of travel, the pervasiveness of communication technology, and the realities of economic/political interdependence have made it essential for organizational women and men to be capable communicators in intercultural settings.

CMN 6085. Strategies for Cross-Cultural Facilitation and Negotiation. 3 Hours.
Examines several cultural theories, such as Hofstede’s national cultural dimensions, Hall and Hall’s contextual levels, along with Kluckhohn and Strodtbeck’s variations in value orientations. Culture is defined as a group of people with shared values and means of being. Offers students an opportunity to acquire skills to move from gut reactions to applying empirically tested methods for cultural interactions and diplomacy. Includes case studies and role-play with a variety of intergenerational, international, racial, and religious groups. Students practice verbal and nonverbal communication to strengthen their diplomacy and public speaking skills. The written signature assignment designs a communication collateral that meets the needs of stakeholders from two different cultures (include different languages/wording). Supports collateral differences based on cultural theories and evidence.

CMN 6090. Organizational Culture, Climate, and Communication. 3 Hours.
Examines the relationship between organizational culture and communication and discusses the advantages and elements of a supportive communication climate. Some researchers believe that the culture of the organization drives the communication quality in an organization. Examines both case analysis and academic research to address common problems pertaining to cultivating supportive communication climates and methods for improving these climates.

CMN 6095. Foundations of Developing Cultural Awareness. 3 Hours.
Examines culture from three pillars: awareness, language, and history/politics. Offers students an opportunity to investigate their personal identity and barriers by incorporating two assessments to determine personal implicit bias and cultural intelligence. Interpretations are constructed from self-reports employing the cultural intelligence (CQ) assessment and Implicit Bias Project. Focuses on the impact of languages on cultures. By identifying nonstandard language and discussing the meaning of words across different languages, offers students an opportunity to gain understanding and formulate sensitivity when communicating with different audiences, albeit intergenerational and/or international. Examines the impact of history and politics on cultural groups, specifically as related to cross-cultural communication. The written signature assignment is a personal reflection analysis on insights gained throughout the course and career aspirations.

CMN 6100. Communication Networks and Managing Information. 3 Hours.
Examines new electronic technologies as well as other approaches to disseminating information. Organizations can employ various methods for communicating in organizations. Analyzes what types of information must be communicated in organizations and the impediments to successful transmission of information. Uses case studies to offer students an opportunity to identify problems with information management as well as methods for ameliorating situations caused by poor communication management.

CMN 6110. Group Dynamics and Interpersonal Conflict: Meeting Management. 3 Hours.
Examines common problems with organization meetings and intervention techniques that can be employed to reduce the tensions associated with such interaction. Discusses methods used for evaluating individual members in meeting contexts. A central part of the course involves participation in and evaluation of meeting interaction.

CMN 6130. Testing Communication Quality. 6 Hours.
Reviews measurement methods for assessing the quality of an organization’s communication efforts. examines specific measurement tools, including surveys, focus groups, and Web site metrics.

CMN 6200. Strategic Communications Advisor: Roles and Responsibilities. 3 Hours.
Examines the role of strategic communication in support of business and organizational performance and advisory capacity to senior management. Seeks to build consultative and leadership skills and competencies. Offers students an opportunity to articulate organizational strategy to internal and external audiences and to monitor communication effectiveness using communication dashboards/scorecards.

CMN 6201. Managing Communication Resources. 3 Hours.
Examines the fundamental responsibilities of managing and allocating resources to build an effective communication function, including return-on-investment methodology, negotiation skills, and budgeting. Explores the pros and cons of outsourcing vs. internal capacity development and the best practices in managing external agency resources.
CMN 6202. Management Symposium. 3 Hours.
Offers students an opportunity to be coached by instructors with senior communication management experience as they examine “real-time” challenges in managing talent and resources. Expects students to work in teams on short-term Experiential Network projects in order to test their consultative and management skills.

CMN 6500. Organizational Communication. 6 Hours.
Examines fundamental principles and theories as well as the range of topics within the field. Analyzes the effects of communication on organizational quality and methods of managing information. Discusses specific skill sets necessary for effective internal communication and the value and methods used to create organizational networks. Studies the influence of organizational culture on organizational communication. Introduces elements of crisis communication, intercultural communication, and communication assessment.

CMN 6502. Organizational Communication: Applications and Assessment. 6 Hours.
Examines a wide range of communication media, with a particular focus on virtual and face-to-face meetings and facilitation techniques. Effective organizational communication is imperative for organizational excellence. Consequently, organizations and their leaders need to be skilled communicators in a variety of contexts and, just as significantly, must be able to assess the effectiveness of their communications. Using case studies and team projects, offers students an opportunity to determine the most effective media for delivering messages to targeted audiences.

CMN 6504. Communication and Organizational Culture. 6 Hours.
Examines the relationship between organizational culture and communication and discusses the advantages and elements of a supportive communication climate. Some researchers believe that the culture of the organization drives the communication quality in an organization. Examines both case analysis and academic research to address common problems pertaining to cultivating supportive communication climates and methods for improving these climates. Also explores the role of communication in the organizational change process, including development of plans to support the business and behavioral objectives of an organization’s change initiative.

CMN 6505. Professional Speaking. 6 Hours.
Examines styles of speaking, methods for structuring addresses, and the use/misuse of visual support. Focuses on several types of interviews common within organizational settings, including performance appraisals, informational, and problem-solving interviews. The ability to deliver effective professional presentations is empowering. Emphasizes practical experience in delivering presentations and conducting interviews.

CMN 6506. Intercultural Communication and the Organization. 5 Hours.
Discusses the impediments to effective intercultural communication and methods for overcoming these impediments. The ease of travel, the pervasiveness of communication technology, and the realities of economic/political interdependence have made it essential for organizational women and men to be capable communicators in intercultural settings.

CMN 6510. Internal and External Negotiation and Mediation. 6 Hours.
Introduces the techniques of dispute resolution. Emphasizes the processes of mediation, facilitation, and negotiation. Examines techniques suggested by practitioners and researchers regarding best practices for effective negotiation. A central part of the course requires students to participate in and evaluate negotiation simulations.

CMN 6910. Organizational Communication Assessment. 3 Hours.
Discusses quantitative and qualitative methods for conducting assessments called communication audits. If communication is central to organizational activity, then persons must be able to assess the quality of communication within organizations. Offers students an opportunity to evaluate the advantages and disadvantages of each technique and to participate in conducting a communication audit.

CMN 6940. Projects for Professionals. 3 Hours.
Offers students an opportunity to apply knowledge and skills gained through their organizational communication master’s program to challenging short-term projects under faculty supervision. Students are matched with discipline-specific consulting projects provided by a wide range of sponsoring organizations in the private and nonprofit sectors. Offers students an opportunity to develop a project plan, conduct research, develop and deliver recommendations to the sponsoring organization, and reflect on “lessons learned.” Mapping organizational communication concepts and skills to the consultative process is a primary learning outcome. Requires an application process. This is a capstone course. Students with less than two years of professional communication-related experience must successfully complete a noncredit experiential learning project before registering for the capstone course.

CMN 6943. Integrative Experiential Learning. 3 Hours.
Offers students an opportunity to apply knowledge and skills gained through their previous course work to a challenging short-term project under faculty supervision. Students should identify a communication-related project, conduct research, and develop and deliver recommendations to a sponsor within the student’s own organization.

CMN 6941. Internship. 1-4 Hours.
Offers students an opportunity to obtain supervised professional experience (related to course work) at an on-site location within the community. May be repeated without limit.

CMN 6960. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CMN 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

CMN 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for work experience.

CMN 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

CMN 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

CMN 6983. Topics. 1-4 Hours.
Covers special topics in communication studies. May be repeated without limit.

CMN 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

CMN 6990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
CET 2100. Essentials of Computer Organization. 3 Hours.
Covers the structure and organization of computing systems. Topics include basic computer architecture, CPU and arithmetic-logic unit design, the datapath, input/output methods, memory management including caches and virtual memory, storage, instruction execution, assembly programming and assemblers, instruction formats, addressing modes, peripherals and interfacing, interrupts, and an introduction to operating systems and compilers.

CET 2200. Data Structures and Algorithms. 3 Hours.
Covers the design, analysis, and implementation of data structures and algorithms to solve engineering problems using an object-oriented programming language. Topics include elementary data structures (including arrays, stacks, queues, and lists); advanced data structures (including trees and graphs); the algorithms used to manipulate these structures; and their application to solving practical engineering problems.

CET 2300. Object-Oriented Programming. 3 Hours.
Discusses the fundamental principles of object-oriented programming (OOP) and associated concepts and definitions such as classes, objects, encapsulation, coupling, cohesion, inheritance, abstraction, polymorphisms, and generic dispatch. Provides contextual comparisons of programming paradigms drawing on simple examples and case studies, particularly of purely object-oriented, hybrid, and procedural programming. Examines applicability and illustrates techniques and idioms of OOP in the C++ language using a wide variety of in-class examples and via students’ assignments and small projects. Examines methods of OOP analysis and design via the Unified Modeling Language diagrams.

CET 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CET 3000. Computer Operating Systems. 3 Hours.
Covers the structure of modern operating systems. Topics include operating system structure, processes, threads, interprocess communication, system calls, context switching, address space, memory management, virtual memory, context switching, scheduling, synchronization, deadlocks, storage management, mass storage, file systems, I/O systems, security, and virtual machines.

CET 3100. Computer Networking and Communications Technology. 3 Hours.
Covers the technical foundation for designing, installing, maintaining, and monitoring computer networks. Covers technologies, protocols, and techniques used to connect computers to other computers and hardware components. Topics include the Open Systems Interconnection network model (OSI), internet protocols (TCP/IP), the User Datagram Protocol (UDP), Local Area Networks (LANs) and Wide Area Networks (WANs), wireless networks, network security, virtual private networking, and network management. Covers both circuit-switched and IP-based communications.

CET 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CET 4200. Reconfigurable Computing. 3 Hours.
Covers the foundations of reconfigurable computing. Topics include reconfigurable architectures and systems, design of field programmable gate arrays (FPGAs), design methodologies using FPGAs, operating systems for reconfigurable systems, hardware-software codesign, dynamic reconfiguration, hardware optimization, verification, and applications. Offers students an opportunity to learn to use practical design tools, including VHDL, to implement reconfigurable designs.

CET 4210. Robotics. 3 Hours.
Covers the theory and practice of robotics. Topics include kinematics, dynamics, position and orientation, trajectories, coordinate frames, navigation, closed-loop control, obstacle detection, manipulation of objects, actuators, sensors, systems modeling, analysis, motion control, and techniques for programming robots. Offers students an opportunity to obtain practical experience in constructing and programming a robot system.

CET 4220. Embedded Systems. 3 Hours.
Introduces fundamental concepts of digital signal processing. Offers students an opportunity to understand how to represent, analyze, and manipulate digital signals via theoretical background and hands-on work. Provides technical bases to evaluate, design, and program digital signal processors, considering their architecture and match to embedded applications. Students use acquired knowledge and skills in digital electronics and programming to design, implement, and test simple embedded microprocessors systems for data collection, control, and/or analysis. Topics include embedded systems characteristics, custom and general-purpose processors, general and dedicated software, testing and debugging approaches, memory system design, interfacing, serial and parallel communication, bus standards, protocols, and arbitration.

CET 4230. Computer and Network Security. 3 Hours.
Covers the principles and practice of computer and network security. Topics include the history of security; encryption techniques and applications; secure communications; software protection; vulnerabilities of networks, operating systems, databases, and distributed systems; security standards; security applications; security attacks; malicious software; intrusion detection; firewalls; and user authentication. Surveys legal and ethical concepts, including integrity, confidentiality, authenticity, accountability, and availability.

CET 4240. Software Engineering. 3 Hours.
Covers the principles of software engineering and the phases of the software development life cycle, including requirements gathering, requirements analysis, specification, design, coding, testing, and maintenance. Topics include the Unified Modeling Language; interface design; the use of verification, validation, and documentation; structured analysis; object-oriented design; software metrics; modular design; and modular libraries.

CET 4250. Compilers. 3 Hours.
Covers the principles of compilers. Topics include programming languages, automatata theory, symbol tables, intermediate representations, run-time support, lexical analysis, syntax trees, type checking, parsing, optimization, and code generation. Offers students an opportunity to obtain practical experience designing a compiler.

CET 4950. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

CET 4955. Project. 1-4 Hours.
Focuses on an-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

CET 4983. Topics. 1-4 Hours.
Covers special topics in computer engineering technology. May be repeated without limit.

CET 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CET 4991. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.
CET 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

CET 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

CET 4994. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

CET 4995. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

CET 4996. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major.

**Computer Engineering Technology - CPS (ETC)**

ETC 5211. Oracle Fundamentals 2. 4 Hours.
Offers students an opportunity to develop the necessary understanding of the network aspects to the Oracle architecture. Explores network server and client side configurations, backup and recovery configuration and management, RMAN, and user recovery issues. Examines and practices methods of data loading and transporting. Includes a computer laboratory component.

ETC 5217. Oracle Performance Tuning. 4 Hours.
Covers the various aspects of diagnostic and tuning methods and tools. Focuses on the optimization of database configuration, sizing of cache, SGA structures, the shared pool, and other resources. Covers specific techniques on application tuning, including the optimization of sorts, SQL statements, and other database resources. Includes a computer laboratory component.

ETC 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

**Computer Science (CS)**

CS 0210. Introduction to Search. 1.8 Hour.
Offers a limited-engagement course in which students have an opportunity to learn and practice how to search in large amounts of unstructured data. Covers basic concepts in search, retrieval models, indexing, querying and ranking, and evaluation.

CS 1100. Computer Science and Its Applications. 4 Hours.
Introduces students to the field of computer science and the patterns of thinking that enable them to become intelligent users of software tools in a problem-solving setting. Examines several important software applications so that students may develop the skills necessary to use computers effectively in their own disciplines.

CS 1200. Computer Science/Information Science Overview 1. 1 Hour.
Introduces students to the College of Computer and Information Science (CCIS) and begins their preparation for careers in the computing and information fields. Offers students an opportunity to learn how to thrive at Northeastern and within CCIS by developing academic, professional, and interpersonal skills. Covers the variety of careers available in the high-technology professions. Students work in groups to create and deliver presentations on careers in the field. Intended for freshmen.

CS 1210. Computer Science/Information Science Overview 2: Co-op Preparation. 1 Hour.
Continues the preparation of students for careers in the computing and information fields by discussing co-op and co-op processes. Offers students an opportunity to prepare a professional résumé; practice proper interviewing techniques; explore current job opportunities; learn how to engage in the job and referral process; and to understand co-op policies, procedures, and expectations. Discusses professional behavior and ethical issues in the workplace.

CS 1220. Computer/Information Science Co-op Preparation. 1 Hour.
Prepares students for co-op through topics such as ethics, privacy, security, responsibility, and intellectual property. Exposes students to popular industry technologies. Intended for students who transfer into computer/information science who are above the freshman level.

CS 1500. Algorithms and Data Structures for Engineering. 4 Hours.
Introduces algorithms and data structures for engineering students. Discusses data structures such as arrays, stacks, queues, and lists, and the algorithms that manipulate these structures. Introduces simple algorithm analysis. Discusses classes and objects and presents the basic material about encapsulation, inheritance, and polymorphism. Introduces software development practices such as modular design, use of libraries, testing methods, and debugging techniques.

CS 1501. Lab for CS 1500. 1 Hour.
Accompanies CS 1500. Covers topics from the course through various experiments.

CS 1800. Discrete Structures. 4 Hours.
Introduces the mathematical structures and methods that form the foundation of computer science. Studies structures such as sets, tuples, sequences, lists, trees, and graphs. Discusses functions, relations, ordering, and equivalence relations. Examines inductive and recursive definitions of structures and functions. Discusses principles of proof such as truth tables, inductive proof, and basic logic. Also covers the counting techniques and arguments needed to estimate the size of sets, the growth of functions, and the space-time complexity of algorithms.

CS 1801. Recitation for CS 1800. 0 Hours.
Accompanies CS 1800. Provides students with additional opportunities to ask questions and to see sample problems solved in detail.

CS 1802. Seminar for CS 1800. 1 Hour.
Accompanies CS 1800. Illustrates topics from the lecture course through discussions, quizzes, and homework assignments.

CS 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CS 2500. Fundamentals of Computer Science 1. 4 Hours.
Introduces the fundamental ideas of computing and the principles of programming. Discusses a systematic approach to word problems, including analytic reading, synthesis, goal setting, planning, plan execution, and testing. Presents several models of computing, starting from nothing more than expression evaluation in the spirit of high school algebra. No prior programming experience is assumed; therefore, suitable for freshmen students, majors and nonmajors alike who wish to explore the intellectual ideas in the discipline.

CS 2501. Lab for CS 2500. 1 Hour.
Accompanies CS 2500. Covers topics from the course through various experiments.
CS 3500. Object-Oriented Design. 4 Hours.
Examines how to program in C++ in a robust and safe manner. Reviews basics, including scoping, typing, and primitive data structures. Discusses data types (primitive, array, structure, class, string); addressing/parameter mechanisms (value, pointer, reference); stacks; queues; linked lists; binary trees; hash tables; and the design of classes and class inheritance, emphasizing single inheritance. Considers the instantiation of objects, the trade-offs of stack vs. heap allocation, and the design of constructors and destructors. Emphasizes the need for a strategy for dynamic memory management. Addresses function and operator overloading; templates, the Standard Template Library (STL), and the STL components (containers, generic algorithms, iterators, adaptors, allocators, function objects); streams; exception handling; and system calls for processes and threads.

CS 2510. Fundamentals of Computer Science 2. 4 Hours.
Continues CS 2500. Examines object-oriented programming and associated algorithms using more complex data structures as the focus. Discusses nested structures and nonlinear structures including hash tables, trees, and graphs. Emphasizes abstraction, encapsulation, inheritance, polymorphism, recursion, and object-oriented design patterns. Applies these ideas to sample applications that illustrate the breadth of computer science.

CS 2511. Lab for CS 2510. 1 Hour.
Accompanies CS 2510. Covers topics from the course through various experiments.

CS 2550. Foundations of Cybersecurity. 4 Hours.
Examines a comparative approach to object-oriented programming and design. Discusses the concepts of object, class, meta-class, message, method, inheritance, and genericity. Reviews forms of polymorphism in object-oriented languages. Contrasts the use of inheritance and composition as dual techniques for software reuse: forwarding vs. delegation and subclassing vs. subtyping. Fosters a deeper understanding of the principles of object-oriented programming and design including software components, object-oriented design patterns, and the use of graphical design notations such as UML (unified modeling language). Basic concepts in object-oriented design are illustrated with case studies in application frameworks and by writing programs in one or more object-oriented languages.

CS 2600. Computer Organization. 4 Hours.
Introduces the basic design of computing systems. Covers central processing unit (CPU), memory, input, and output. Provides a complete introduction to assembly language such as the basics of an instruction set plus experience in assembly language programming using a RISC architecture. Uses system calls and interrupt-driven programming to show the interaction with the operating system. Covers machine representation of integers, characters, and floating-point numbers. Describes caches and virtual memory.

CS 2800. Logic and Computation. 4 Hours.
Introduces formal logic and its connections to computer and information science. Offers an opportunity to learn to translate statements about the behavior of computer programs into logical claims and to gain the ability to prove such assertions both by hand and using automated tools. Considers approaches to proving termination, correctness, and safety for programs. Discusses notations used in logic, propositional and first order logic, logical inference, mathematical induction, and structural induction. Introduces the use of logic for modeling the range of artifacts and phenomena that arise in computer and information science.

CS 2801. Lab for CS 2800. 1 Hour.
Accompanies CS 2800. Covers topics from the course through various experiments.

CS 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CS 3200. Database Design. 4 Hours.
Studies the design of a database for use in a relational database management system. The entity-relationship model and normalization are used in problems. Relational algebra and then the SQL (structured query language) are presented. Advanced topics include triggers, stored procedures, indexing, elementary query optimization, and fundamentals of concurrency and recovery. Students implement a database schema and short application programs on one or more commercial relational database management systems.
CS 3700. Networks and Distributed Systems. 4 Hours.
Introduces the fundamentals of computer networks, including network architectures, network topologies, network protocols, layering concepts (for example, ISO/OSI, TCP/IP reference models), communication paradigms (point-to-point vs. multicast/broadcast, connectionless vs. connection oriented), and networking APIs (sockets). Also covers the construction of distributed programs, with an emphasis on high-level protocols and distributed state sharing. Topics include design patterns, transactions, performance trade-offs, security implications, and reliability. Uses examples from real networks (TCP/IP, Ethernet, 802.11) and distributed systems (Web, BitTorrent, DNS) to reinforce concepts.

CS 3740. Systems Security. 4 Hours.
Introduces the fundamental principles of designing and implementing secure programs and systems. Presents and analyzes prevalent classes of attacks against systems. Discusses techniques for identifying the presence of vulnerabilities in system design and implementation, preventing the introduction of or successful completion of attacks, limiting the damage incurred by attacks, and strategies for recovering from system compromises. Offers opportunities for hands-on practice of real-world attack and defense in several domains, including systems administration, the Web, and mobile devices. Presents the ethical considerations of security research and practice.

CS 3800. Theory of Computation. 4 Hours.
Introduces the theory behind computers and computing aimed at answering the question, “What are the capabilities and limitations of computers?” Covers automata theory, computability, and complexity. The automata theory portion includes finite automata, regular expressions, nondeterminism, nonregular languages, context-free languages, pushdown automata, and noncontext-free languages. The computability portion includes Turing machines, the Church-Turing thesis, decidable languages, and the Halting theorem. The complexity portion includes big-O and small-o notation, the classes P and NP, the P vs. NP question, and NP-completeness.

CS 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CS 4000. Senior Seminar. 1 Hour.
Requires students to give a twenty- to thirty-minute formal presentation on a topic of their choice in computer science. Prepares students for this talk by discussing methods of oral presentation, how to present technical material, how to choose what topics to present, overall organization of a talk, and use of presentation software and other visual aids.

CS 4100. Artificial Intelligence. 4 Hours.
Introduces the fundamental problems, theories, and algorithms of the artificial intelligence field. Includes heuristic search; knowledge representation using predicate calculus; automated deduction and its applications; planning; and machine learning. Additional topics include game playing; uncertain reasoning and expert systems; natural language processing; logic for common-sense reasoning; ontologies; and multiagent systems.

CS 4120. Natural Language Processing. 4 Hours.
Introduces the computational modeling of human language; the ongoing effort to create computer programs that can communicate with people in natural language; and current applications of the natural language field, such as automated document classification, intelligent query processing, and information extraction. Topics include computational models of grammar and automatic parsing, statistical language models and the analysis of large text corpora, natural language semantics and programs that understand language, models of discourse structure, and language use by intelligent agents. Course work includes formal and mathematical analysis of language models and implementation of working programs that analyze and interpret natural language text. Knowledge of statistics is helpful.

CS 4150. Game Artificial Intelligence. 4 Hours.
Offers an overview of classical and modern approaches to artificial intelligence in digital games. Focuses on the creation of believable agents and environments with the goal of providing a fun and engaging experience to a player. Covers player modeling, procedural content generation, behavior trees, interactive narrative, decision-making systems, cognitive modeling, and path planning. Explores different approaches for behavior generation, including learning and rule-based systems. Requires students to complete several individual assignments in these areas to apply the concepts covered in class. Students choose a group final project to explore one aspect of artificial intelligence for games in further depth. Offers students an opportunity to learn team management and communication. Students who do not meet course prerequisites may seek permission of instructor.

CS 4200. Database Internals. 4 Hours.
Explores the internal workings of database management systems. Explains how database systems store data on disks. Studies how to improve query efficiency using index techniques such as B+ tree, hash indices, and multidimensional indices. Describes how queries are executed internally and how database systems perform query optimizations. Introduces concurrency control schemes implemented by locking, such as hierarchical locking and key range locking. Describes lock table structure. Discusses how database systems can perform logging and recovery to avoid loss of data in case of system crashes.

CS 4240. Large-Scale Parallel Data Processing. 4 Hours.
Covers techniques for managing and analyzing very large data sets, with an emphasis on approaches that scale out effectively as more compute nodes are added. Introduces principles of distributed data management and strategies for problem-driven data partitioning through a selection of design patterns from various application domains, including graph analysis, databases, text processing, and data mining. Offers students an opportunity to obtain hands-on programming experience with modern big-data processing technology such as MapReduce, Spark, HBase, and cloud computing (this selection is subject to change as technology evolves).

CS 4300. Computer Graphics. 4 Hours.
Charts a path through every major aspect of computer graphics with varying degrees of emphasis. Discusses hardware issues: size and speed; lines, polygons, and regions; modeling, or objects and their relations; viewing, or what can be seen (visibility and perspective); rendering, or how it looks (properties of surfaces, light, and color); transformations, or moving, placing, distorting, and animating and interaction, or drawing, selecting, and transforming.
CS 4400. Programming Languages. 4 Hours.
Introduces a systematic approach to understanding the behavior of programming languages. Covers interpreters; static and dynamic scope; environments; binding and assignment; functions and recursion; parameter-passing and method dispatch; objects, classes, inheritance, and polymorphism; type rules and type checking; and concurrency.

CS 4410. Compilers. 4 Hours.
Studies the construction of compilers and integrates material from earlier courses on programming languages, automata theory, computer architecture, and software design. Examines syntactic trees; static semantics; type checking; typical machine architectures and their software structures; code generation; lexical analysis; and parsing techniques. Uses a hands-on approach with a substantial term project.

CS 4500. Software Development. 4 Hours.
Considers software development as a systematic process involving specification, design, documentation, implementation, testing, and maintenance. Examines software process models; methods for software specification; modularity, abstraction, and software reuse; and issues of software quality. Students, possibly working in groups, design, document, implement, test, and modify software projects.

CS 4510. Software Testing. 4 Hours.
Examines the software development process from the point of view of testing. Focuses on unit testing, white- and black-box testing, randomized testing, the design of equality comparison, and the design of a test tool that evaluates the tests and reports the results. Next considers integration testing, stress tests and other performance tests, testing automation, and other techniques for assuring correctness and integrity of programs with several interacting components. Explores tools for measuring code quality and how these tools may be used to improve code design. Requires a comprehensive project in which all techniques studied are applied.

CS 4520. Mobile Application Development. 4 Hours.
Focuses on mobile application development on a mobile phone or related platform. Discusses memory management; user interface building, including both MVC principles and specific tools; touch events; data handling, including core data, SQL, XML, and JSON; network techniques and URL loading; and, finally, specifics such as GPS and motion sensing that may be dependent on the particular mobile platform. Students are expected to work on a project that produces a professional-quality mobile application. The instructor chooses a modern mobile platform to be used in the course.

CS 4550. Web Development. 4 Hours.
Discusses Web development for sites that are dynamic, data driven, and interactive. Focuses on the software development issues of integrating multiple languages, assorted data technologies, and Web interaction. Considers ASP.NET, C#, HTTP, HTML, CSS, XML, XSLT, JavaScript, AJAX, RSS/Atom, SQL, and Web services. Requires each student to deploy individually designed Web experiments that illustrate the Web technologies and at least one major integrative Web site project. Students may work as a team with the permission of the instructor. Each student or team must also create extensive documentation of their goals, plans, design decisions, accomplishments, and user guidelines. All source files must be open and be automatically served by a sources server.

CS 4600. Topics in Operating Systems. 4 Hours.
Studies advanced concepts underlying computer operating systems and computer networks. Examines in depth all major operating-system and network components including device drivers, network protocol stacks, memory managers, centralized and distributed file systems, interprocess communication mechanisms, real-time schedulers, and security mechanisms. Additional components are covered as time permits. Provides hands-on experience with the source code of commercial-grade operating systems and networks.

CS 4610. Robotic Science and Systems. 4 Hours.
Introduces autonomous mobile robots, with a focus on algorithms and software development, including closed-loop control, robot software architecture, wheeled locomotion and navigation, tactile and basic visual sensing, obstacle detection and avoidance, and grasping and manipulation of objects. Offers students an opportunity to progressively construct mobile robots from a predesigned electromechanical kit. The robots are controlled wirelessly by software of the students’ own design, built within a provided robotics software framework. The course culminates in a grand challenge competition using all features of the robots.

CS 4611. Lab for CS 4610. 1 Hour.
Offers a laboratory course to accompany CS 4610.

CS 4620. Building Extensible Systems. 4 Hours.
Deals with the design of extensible software systems, which enable clients to add functionality both statically as well as dynamically. Examples of such systems are operating systems, game servers, and Web browsers. Describes the classic systems built on C-like languages with unsafe, manual memory control and the more recent systems built on Java-like languages with safe, automated memory management. Introduces the Rust programming language, which combines the efficiency of C with safe manual memory control via type specifications and compiler constraints. Offers students an opportunity to build systems using all three settings but focuses on the Rust approach. Students also have an opportunity to evaluate their work via essays and memos.

CS 4650. High Performance Computing. 4 Hours.
Introduces students to research in the domain of high-performance computing. Each instance of this course covers a single topic with broad open questions. The required systems background needed to investigate these questions is covered in the first part of the course. Then, working in teams, students have an opportunity to address different aspects of the open questions so that in combination the entire class may learn more than any single team could accomplish. Example topics include use of new hardware such as GPUs on video boards, use of new software tools for multicore computing, development of check-pointing packages for more robust long computations, software for GUI window systems, and cloud computing. May be repeated once.

CS 4700. Network Fundamentals. 4 Hours.
Introduces the fundamental concepts of network protocols and network architectures. Presents the different harmonizing functions needed for the communication and effective operation of computer networks. Provides in-depth coverage of data link control, medium access control, routing, end-to-end transport protocols, congestion and flow control, multicasting, naming, auto configuration, quality of service, and network management. Studies the abstract mechanisms and algorithms as implemented in real-world Internet protocols. Also covers the most common application protocols (e-mail, Web, and ftp).
CS 4710. Mobile and Wireless Systems. 4 Hours.
Covers both theoretical foundations of wireless/mobile networking and practical aspects of wireless/mobile systems, including current standards, mobile development platforms, and emerging technologies. Incorporates a strong practical component; requires students to work in teams on several practical assignments (e.g., based on Wi-Fi sensing, mobile applications, Internet-of-Things devices, and software-defined radio applications) and a final project. The final project integrates knowledge about several wireless communication technologies and mechanisms.

CS 4740. Network Security. 4 Hours.
Studies topics related to Internet architecture and cryptographic schemes in the context of security. Provides advanced coverage of the major Internet protocols including IP and DNS. Examines denial of service, viruses, and worms, and discusses techniques for protection. Covers cryptographic paradigms and algorithms such as RSA and Diffie-Hellman in sufficient mathematical detail. The advanced topics address the design and implementation of authentication protocols and existing standardized security protocols. Explores the security of commonly used applications like the Web and e-mail.

CS 4750. Secure Wireless Ad Hoc Robots on Mission (SWARM) 1. 4 Hours.
Introduces the concepts underlying the design of robust and secure heterogeneous wireless networking of mobile robots: Internetworking, security, wireless communication, embedded development, and mobile phone platforms. Students form mixed teams with the goal of designing and building rescue-mission-oriented heterogeneous wireless systems operating in adversarial environments. These systems consist of off-the-shelf robots enhanced by the students with a low-power control and sensing embedded system; a low-power digital radio frequency communication network; a coordination unit connected to the Internet; and a messaging and command system based on cell phones. The course culminates in a competition between teams. Students are graded based on their designs, presentations, innovation, robustness, and competition performance. Graduate students are expected to make a research contribution.

CS 4760. Secure Wireless Ad Hoc Robots on Mission (SWARM) 2. 4 Hours.
Continues CS 4750. Based on the experiences in CS 4750, student teams have an opportunity to build more autonomous systems that can navigate areas where wireless communication or direct visibility are not possible. The systems must be resilient to more sophisticated denial-of-service attacks and need to more carefully account for energy consumption expended on mobility, communication, and meeting the mission task. Graduate students are expected to make a research contribution.

CS 4770. Cryptography. 4 Hours.
Studies the design of cryptographic schemes that enable secure communication and computation. Emphasizes cryptography as a mathematically rigorous discipline with precise definitions, theorems, and proofs and highlights deep connections to information theory, computational complexity, and number theory. Topics include pseudorandomness; symmetric-key cryptosystems and block ciphers such as AES; hash functions; public-key cryptosystems, including ones based on factoring and discrete logarithms; signature schemes; secure multiparty computation and applications such as auctions and voting; and zero-knowledge proofs.

CS 4800. Algorithms and Data. 4 Hours.
Introduces the basic principles and techniques for the design, analysis, and implementation of efficient algorithms and data representations. Discusses asymptotic analysis and formal methods for establishing the correctness of algorithms. Considers divide-and-conquer algorithms, graph traversal algorithms, and optimization techniques. Introduces information theory and covers the fundamental structures for representing data. Examines flat and hierarchical representations, dynamic data representations, and data compression. Concludes with a discussion of the relationship of the topics in this course to complexity theory and the notion of the hardness of problems.

CS 4850. Building Game Engines. 4 Hours.
Discusses the components of game engines and strategies for their software implementation. Includes graphics management algorithms (animation, scene graph, level of detail); basic artificial intelligence algorithms (search, decision making, sensing); and related algorithmic issues (networking, threading, input processing). Explores the use of data-driven software design. Offers students an opportunity to use a rendering engine and to build and integrate several software components to create a complete game engine. Requires students to work on several individual assignments to apply the algorithms and then develop a project in a team. Offers students an opportunity to learn team/project management; work division; team communication; and the software development cycle of implementation, testing, critique, and further iteration. Students who do not meet course prerequisites may seek permission of instructor.

CS 4900. Honors Senior Seminar. 4 Hours.
Offers a capstone course for computer science honors students. Exposes students to one or more topics of current interest in computer science. Requires students to prepare a one-hour presentation on a topic in computer science and to write a paper on that topic.

CS 4910. Computer Science Topics. 4 Hours.
Offers a lecture course in computer science on a topic not regularly taught in a formal course. Topics may vary from offering to offering. May be repeated up to three times.

CS 4920. Computer Science Project. 4 Hours.
Focuses on students developing a substantial software or hardware artifact under faculty supervision. May be repeated up to three times.

CS 4930. Cybersecurity Capstone. 4 Hours.
Provides the culmination of the learned principles and methodologies for identifying and addressing cybersecurity issues in organizations. Offers students an opportunity to work in small groups to identify and scope a current cybersecurity problem/challenge. Requires students to submit a written proposal about the project, complete with motivation, literature research, and reasons for the study; create a work plan to develop a solution to include the development and identification of the data necessary to properly solve the problem/challenge; and create a final report.

CS 4940. Research Projects on National Security. 4 Hours.
Engages students in national cybersecurity/information systems security problems. Offers students an opportunity to learn how to apply research techniques, think clearly about these issues, formulate and analyze potential solutions, and communicate their results. Working in small groups under the mentorship of external mentors from government and industry, each student has an opportunity to formulate, carry out, and present original research on current cybersecurity/information assurance problems of interest to the nation. As part of this research, students are required to submit a written proposal about the project, complete with motivation, literature research, and reasons for the study; create a work plan for the research problem; and create a final report.
CS 5002. Discrete and Data Structures. 4 Hours.
Introduces the mathematical structures and methods that form the foundation of computer science. Studies structures such as sets, tuples, sequences, lists, trees, and graphs. Discusses functions, relations, ordering, and equivalence relations. Examines inductive and recursive definitions of structures and functions. Covers principles of proof such as truth tables, inductive proof, and basic logic and the counting techniques and arguments needed to estimate the size of sets, the growth of functions, and the space-time complexity of algorithms. Also, discusses data structures such as arrays, stacks, queues, lists, and the algorithms that manipulate them.

CS 5003. Recitation for CS 5001. 0 Hours.
Provides a small-group discussion format to cover material in CS 5001. Coreq CS 5001.

CS 5004. Object-Oriented Design. 4 Hours.
Introduces a comparative approach to object-oriented programming and design. Discusses the concepts of object, class, metaclass, message, method, inheritance, and genericity. Reviews forms of polymorphism in object-oriented languages. Examines the use of inheritance and composition as dual techniques for software reuse—forwarding vs. delegation and subclassing vs. subtyping. Offers students an opportunity to obtain a deeper understanding of the principles of object-oriented programming and design, including software components, object-oriented design patterns, and the use of graphical design notations such as UML (unified modeling language). Illustrates basic concepts in object-oriented design with case studies in application frameworks and by writing programs in Java.

CS 5005. Recitation for CS 5004. 0 Hours.
Provides a small-group discussion format to cover material in CS 5004.

CS 5006. Algorithms. 2 Hours.
Introduces the basic principles and techniques for the design and implementation of efficient algorithms and data representations. Considers divide-and-conquer algorithms, graph traversal algorithms, linear programming, and optimization techniques. Covers the fundamental structures for representing data, such as hash tables, trees, and graphs.

CS 5007. Computer Systems. 2 Hours.
Introduces the basic design of computer systems, computer operating systems, and assembly language using a RISC architecture. Describes caches and virtual memory. Covers the interface between assembly language and high-level languages, including call frames and pointers; the use of system calls and systems programming to show the interaction with the operating system; and the basic structures of an operating system, including application interfaces, processes, threads, synchronization, interprocess communication, deadlock, memory management, file systems, and input/output control.

CS 5010. Programming Design Paradigm. 4 Hours.
Introduces modern program design paradigms. Starts with functional program design, introducing the notion of a design recipe. The latter consists of two parts: a task organization (ranging from the description of data to the creation of a test suite) and a data-oriented approach to the organization of programs (ranging from atomic data to self-referential data definitions and functions as data). The course then progresses to object-oriented design, explaining how it generalizes and contrasts with functional design. In addition to studying program design, students also have an opportunity to practice pair-programming and public code review techniques, as found in industry today.

CS 5011. Recitation for CS 5010. 0 Hours.
Provides a small-group discussion format to cover material in CS 5010.
CS 5100. Foundations of Artificial Intelligence. 4 Hours.
Introduces the fundamental problems, theories, and algorithms of the artificial intelligence field. Topics include heuristic search and game trees, knowledge representation using predicate calculus, automated deduction and its applications, problem solving and planning, and introduction to machine learning. Required course work includes the creation of working programs that solve problems, reason logically, and/or improve their own performance using techniques presented in the course. Requires experience in Java programming.

CS 5150. Game Artificial Intelligence. 4 Hours.
Offers an overview of classical and modern approaches to artificial intelligence in digital games. Focuses on the creation of believable agents and environments with the goal of providing a fun and engaging experience to a player. Covers player modeling, procedural content generation, behavior trees, interactive narrative, decision-making systems, cognitive modeling, and path planning. Explores different approaches for behavior generation, including learning and rule-based systems. Requires students to complete several individual assignments in these areas to apply the concepts covered in class. Students choose a group final project, which requires a report, to explore one aspect of artificial intelligence for games in further depth. Offers students an opportunity to learn team management and communication. Requires knowledge of algorithms and experience with object-oriented design or functional programming.

CS 5200. Database Management Systems. 4 Hours.
Introduces relational database management systems as a class of software systems. Prepares students to be sophisticated users of database management systems. Covers design theory, query language, and performance/tuning issues. Topics include relational algebra, SQL, stored procedures, user-defined functions, cursors, embedded SQL programs, client-server interfaces, entity-relationship diagrams, normalization, B-trees, concurrency, transactions, database security, constraints, object-relational DBMSs, and specialized engines such as spatial, text, XML conversion, and time series. Includes exercises using a commercial relational or object-relational database management system.

CS 5310. Computer Graphics. 4 Hours.
Introduces the fundamentals of two-dimensional and three-dimensional computer graphics, with an emphasis on approaches for obtaining realistic images. Covers two-dimensional algorithms for drawing lines and curves, anti-aliasing, filling, and clipping. Studies rendering of three-dimensional scenes composed of spheres, polygons, quadric surfaces, and bi-cubic surfaces using ray-tracing and radiosity. Includes techniques for adding texture to surfaces using texture and bump maps, noise, and turbulence. Requires knowledge of linear algebra.

CS 5320. Digital Image Processing. 4 Hours.
Studies the fundamental concepts of digital image processing including digitization and display of images, manipulation of images to enhance or restore image detail, encoding (compression) of images, detection of edges and other object features in images, and the formation of computed tomography (CT) images. Introduces mathematical tools such as linear systems theory and Fourier analysis and uses them to motivate and explain these image processing techniques. Requires knowledge of linear algebra.

CS 5330. Pattern Recognition and Computer Vision. 4 Hours.
Introduces fundamental techniques for low-level and high-level computer vision. Examines image formation, early processing, boundary detection, image segmentation, texture analysis, shape from shading, photometric stereo, motion analysis via optic flow, object modeling, shape description, and object recognition (classification). Discusses models of human vision (gestalt effects, texture perception, subjective contours, visual illusions, apparent motion, mental rotations, and cyclopean vision). Requires knowledge of linear algebra.

CS 5335. Robotic Science and Systems. 4 Hours.
Introduces autonomous mobile robots with a focus on algorithms and software development, including closed-loop control, robot software architecture, wheeled locomotion and navigation, tactile and basic visual sensing, obstacle detection and avoidance, and grasping and manipulation of objects. Offers students an opportunity to progressively construct mobile robots from a predesigned electromechanical kit. The robots are controlled wirelessly by software of the students' own design, built within a provided robotics software framework. Culminates in a project that connects the algorithms and hardware developed in the course with a selected topic in the current robotics research literature.

CS 5336. Lab for CS 5335. 0 Hours.
Offers a lab section to accompany CS 5335.

CS 5340. Computer/Human Interaction. 4 Hours.
Covers the principles of human-computer interaction and the design and evaluation of user interfaces. Topics include an overview of human information processing subsystems (perception, memory, attention, and problem solving); how the properties of these systems affect the design of user interfaces; the principles, guidelines, and specification languages for designing good user interfaces, with emphasis on tool kits and libraries of standard graphical user interface objects; and a variety of interface evaluation methodologies that can be used to measure the usability of software. Other topics may include World Wide Web design principles and tools, computer-supported cooperative work, multimedia and “next generation” interfaces, speech and natural language interfaces, and virtual reality interfaces. Course work includes both the creation and implementation of original user interface designs, and the evaluation of user interfaces created by others. Requires knowledge of C programming language/UNIX.

CS 5350. Applied Geometric Representation and Computation. 4 Hours.
Surveys practical techniques for representing geometric objects in two and three dimensions, for computing their motions and interactions, and for human interfaces to manipulate them. These techniques are useful not only in graphics but also in robotics, computer vision, game design, geographic information systems, computer-aided design and manufacturing, spatial reasoning and planning, physical simulation, biomechanics, and the implementation of many types of human-computer interface. Requires undergraduate background in algorithms.

CS 5400. Principles of Programming Language. 4 Hours.
Studies the basic components of programming languages, specification of syntax and semantics, and description and implementation of programming language features. Discusses examples from a variety of languages.
CS 5500. Managing Software Development. 4 Hours.
Covers software life cycle models (waterfall, spiral, and so forth), domain engineering methods, requirements analysis methods (including formal specifications), software design principles and methods, verification and testing methods, resource and schedule estimation for individual software engineers, component-based software development methods and architecture, and languages for describing software processes. Includes a project where some of the software engineering methods (from domain modeling to testing) are applied in an example. Requires admission to MS program or completion of all transition courses.

CS 5520. Mobile Application Development. 4 Hours.
Focuses on mobile application development on a mobile phone or related platform. Discusses memory management; user interface building, including both MVC principles and specific tools; touch events; data handling, including core data, SQL, XML, and JSON; network techniques and URL loading; and, finally, specifics such as GPS and motion sensing that may be dependent on the particular mobile platform. Students are expected to work on a project that produces a professional-quality mobile application and to demonstrate the application that they have developed. The instructor chooses a modern mobile platform to be used in the course.

CS 5600. Computer Systems. 4 Hours.
Studies the structure, components, design, implementation, and internal operation of computer systems, focusing mainly on the operating system level. Reviews computer hardware and architecture including the arithmetic and logic unit, and the control unit. Covers current operating system components and construction techniques including the memory and memory controller, I/O device management, device drivers, memory management, file system structures, and the user interface. Introduces distributed operating systems. Discusses issues arising from concurrency and distribution, such as scheduling of concurrent processes, interprocess communication and synchronization, resource sharing and allocation, and deadlock management and resolution. Includes examples from real operating systems. Exposes students to the system concepts through programming exercises. Requires admission to MS program or completion of all transition courses.

CS 5610. Web Development. 4 Hours.
Discusses Web development for sites that are dynamic, data driven, and interactive. Focuses on the software development issues of integrating multiple languages, assorted data technologies, and Web interaction. Considers ASP.NET, C#, HTTP, HTML, CSS, XML, XSLT, JavaScript, AJAX, RSS/Atom, SQL, and Web services. Each student must deploy individually designed Web experiments that illustrate the Web technologies and at least one major integrative Web site project. Students may work in teams with the permission of the instructor. Each student or team must also create extensive documentation of their goals, plans, design decisions, accomplishments, and user guidelines. All source files must be open and be automatically served by a sources server.

CS 5620. Computer Architecture. 4 Hours.
Studies the design of digital computer system components including the CPU, the memory subsystem, and interconnection busses and networks. Explores modern design techniques for increasing computer system capacity. Emphasizes the growing gap between CPU and RAM speed, and the parallel operation of the growing number of functional units in a CPU. Topics include pipelining, cache, new CPU architecture models, memory bandwidth and latency, multiprocessing and parallel processing architectures, cache coherence, and memory consistency.

CS 5650. High Performance Computing. 4 Hours.
Introduces students to research in the domain of high performance computing. Each instance of this course covers a single topic with broad open questions. The required systems background needed to investigate these questions is covered in the first part of the course. Then, working in teams, students have an opportunity to address different aspects of the open questions so that in combination the entire class may learn more than any single team could accomplish. Example topics include use of new hardware such as GPUs on video boards; use of new software tools for multicore computing; development of check-pointing packages for more robust long computations; software for GUI window systems; and cloud computing.

CS 5700. Fundamentals of Computer Networking. 4 Hours.
Studies network protocols, focusing on modeling and analysis, and architectures. Introduces modeling concepts, emphasizing queuing theory, including Little’s theorem, M/M/1, M/M/m, M/D/1, and M/G/1 queuing systems. Discusses performance evaluation of computer networks including performance metrics, evaluation tools and methodology, simulation techniques, and limitations. Presents the different harmonizing functions needed for communication and efficient operation of computer networks and discusses examples of Ethernet, FDDI, and wireless networks. Covers link layer protocols including HDLC, PPP, and SLIP; packet framing; spanning tree and learning bridges, error detection techniques, and automatic repeat request algorithms; sliding window and reliable/ordered services; and queueing disciplines including FQ and WFQ. Introduces flow control schemes, such as window flow control and leaky bucket rate control schemes, and discusses congestion control and fairness. Requires knowledge of probability theory.

CS 5750. Social Computing. 4 Hours.
Offers a detailed look at popular social information systems. Studies models (both computational and sociological) of social information systems and the application of them both in theory and by analyzing real data from social network interactions. The recent popularity of online social media underlies a shift in the way people connect, communicate, and share content. When designing social computing systems, one must now understand and carefully consider the structure and use of the underlying social network. Considers questions such as: How does information spread through a social network? What mechanisms work best at encouraging collaboration?.

CS 5770. Software Vulnerabilities and Security. 4 Hours.
Seeks to help students to become aware of systems security issues and to gain a basic understanding of security. Presents the principal software and applications used in the Internet, discussing in detail the related vulnerabilities and how they are exploited. Also discusses programming vulnerabilities and how they are exploited. Examines protection and detection techniques. Includes a number of practical lab assignments as well as a discussion of current research in the field.

CS 5800. Algorithms. 4 Hours.
Presents the mathematical techniques used for the design and analysis of computer algorithms. Focuses on algorithmic design paradigms and techniques for analyzing the correctness, time, and space complexity of algorithms. Topics may include asymptotic notation, recurrences, loop invariants, Hoare triples, sorting and searching, advanced data structures, lower bounds, hashing, greedy algorithms, dynamic programming, graph algorithms, and NP-completeness.
CS 5850. Building Game Engines. 4 Hours.
Discusses the components of game engines and strategies for their software implementation. Includes graphics management algorithms (animation, scene graph, level of detail); basic artificial intelligence algorithms (search, decision making, sensing); and related algorithmic issues (networking, threading, input processing). Explores the use of data-driven software design. Offers students an opportunity to use a rendering engine and to build and integrate several software components to create a complete game engine. Requires students to work on individual assignments and then develop a project in a team, which requires a report. Offers students an opportunity to learn team/project management; work division; team communication; and the software development cycle of implementation, testing, critique, and further iteration. Requires knowledge of computer graphics, differential calculus, operating systems concepts, and algorithms.

CS 5976. Directed Study. 2-4 Hours.
Focuses on student examining standard computer science material in fresh ways or new computer science material that is not covered in formal courses. May be repeated up to three times.

CS 5978. Independent Study. 2-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated up to three times.

CS 5984. Research. 2-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated up to three times.

CS 6110. Knowledge-Based Systems. 4 Hours.
Focuses on the acquisition, organization, and use of world knowledge in computers, and the challenge of creating programs with common sense. Topics include knowledge representation and reasoning models beyond predicate calculus, Bayesian inference and other models of reasoning and decision making under uncertainty, rule-based expert systems, case-based and analogical reasoning, and introduction to natural language processing. Course work includes the creation of working programs that store and manipulate world knowledge using techniques presented in the course.

CS 6120. Natural Language Processing. 4 Hours.
Provides an introduction to the computational modeling of human language, the ongoing effort to create computer programs that can communicate with people in natural language, and current applications of the natural language field, such as automated document classification, intelligent query processing, and information extraction. Topics include computational models of grammar and automatic parsing, statistical language models and the analysis of large text corpuses, natural language semantics and programs that understand language, models of discourse structure, and language use by intelligent agents. Course work includes formal and mathematical analysis of language models, and implementation of working programs that analyze and interpret natural language text.

CS 6130. Affective Computing. 4 Hours.
Studies affective computing—computing that relates to, arises from, or influences emotions. Offers an overview of the theory of human emotion (how it arises from and influences cognition, the body, and the social environment) and computational techniques for modeling human emotion processes as well as for recognizing and synthesizing emotional behavior. Discusses how these can be applied to application design. Offers students an opportunity to gain a strong background in the theory and practice of human-centered computing as it relates to games, immersive environments, and pedagogical applications. Brings together students from different disciplines to work together and learn from each other. CS 6130 and PSYC 6130 are cross-listed.

CS 6140. Machine Learning. 4 Hours.
Provides a broad look at a variety of techniques used in machine learning and data mining, and also examines issues associated with their use. Topics include algorithms for supervised learning including decision tree induction, artificial neural networks, instance-based learning, probabilistic methods, and support vector machines; unsupervised learning; and reinforcement learning. Also covers computational learning theory and other methods for analyzing and measuring the performance of learning algorithms. Course work includes a programming term project.

CS 6200. Information Retrieval. 4 Hours.
Provides an introduction to information retrieval systems and different approaches to information retrieval. Topics covered include evaluation of information retrieval systems; retrieval, language, and indexing models; file organization; compression; relevance feedback; clustering; distributed retrieval and metasearch; probabilistic approaches to information retrieval; Web retrieval; filtering, collaborative filtering, and recommendation systems; cross-language IR; multimedia IR; and machine learning for information retrieval.

CS 6220. Data Mining Techniques. 4 Hours.
Covers various aspects of data mining, including classification, prediction, ensemble methods, association rules, sequence mining, and cluster analysis. The class project involves hands-on practice of mining useful knowledge from a large data set.

CS 6240. Large-Scale Parallel Data Processing. 4 Hours.
Covers big-data analysis techniques that scale out with increasing number of compute nodes, e.g., for cloud computing. Focuses on approaches for problem and data partitioning that distribute work effectively while keeping total cost for computation and data transfer low. Deterministic and random algorithms from a variety of domains, including graphs, data mining, linear algebra, and information retrieval, are studied and analyzed in terms of their cost, scalability, and robustness against skew. Coursework emphasizes hands-on programming experience with modern state-of-the-art big-data processing technology. Students who do not meet course prerequisites may seek permission of instructor.

CS 6310. Computational Imaging. 4 Hours.
Introduces the latest computational methods in digital imaging that overcome the traditional limitations of a camera and enable novel imaging applications. Provides a practical guide to topics in image capture and manipulation methods for generating compelling pictures for computer graphics and for extracting scene properties for computer vision, with several examples.

CS 6350. Empirical Research Methods. 4 Hours.
Presents an overview of methods for conducting empirical research within computer science. These methods help provide objective answers to questions about the usability, effectiveness, and acceptability of systems. The course covers the basics of the scientific method, building from a survey of objective measures to the fundamentals of hypothesis testing using relatively simple research designs, and on to more advanced research designs and statistical methods. The course also includes a significant amount of fieldwork, spanning the design, conduct, and presentation of small empirical studies.

CS 6410. Compilers. 4 Hours.
Expects each student to write a small compiler. Topics include parser generation, abstract syntax trees, symbol tables, type checking, generation of intermediate code, simple code improvement, register allocation, run-time structures, and code generation.
CS 6412. Semantics of Programming Language. 4 Hours.
Studies mathematical models for the behavior of programming languages. Topics include operational, denotational, and equational specifications; Lambda-calculi and their properties; applications of these techniques, such as rapid prototyping and correctness of program optimizations. Requires knowledge of discrete mathematics.

CS 6510. Advanced Software Development. 4 Hours.
Designed to integrate academic concepts and practical experience of software design by having students work as part of a programming team, with an option to lead a subteam. Offers students an opportunity to study, in-depth, some aspects of the development process. The goal is to have students participate in a large-scale project, taking time to reflect and analyze the work and the process, rather than concentrating exclusively on the final product. Students who do not meet course prerequisites may seek permission of instructor.

CS 6515. Software Development. 4 Hours.
Covers proven techniques for constructing maintainable software. Includes problem and data analysis, data definitions, concise specifications, interfaces, example and test data design, program design based on data definitions, and testing. Offers students an opportunity to practice what they learn and learn from what they practice through an evolving semester-long project in the programming language of their choice.

CS 6520. Methods of Software Development. 4 Hours.
Studies concepts of object-oriented programming that form the basis for components (generic programming, programming by contracts, or programming with metaclasses), software architecture for supporting components (implicit invocation, filters, or reflection), and the concrete realizations of components in some industrial standards (JavaBeans, EJB, CORBA, or COM/DCOM). Also covers selected topics in component research. Students complete a project where some creation, deployment, and evolution methods of software components are applied.

CS 6530. Analysis of Software Artifacts. 4 Hours.
Addresses all kinds of software artifacts—specifications, designs, code, and so on—and covers both traditional analyses, such as verification and testing, and promising new approaches, such as model checking, abstract execution, and new type systems. Focuses on the analysis of function (for finding errors in artifacts and to support maintenance and reverse engineering), but the course also address other kinds of analysis (such as performance and security).

CS 6535. Engineering Reliable Software. 4 Hours.
Continues the exploration of several themes from CS 5010: unit testing, random testing, and logical reasoning about software. Specifically revisits the idea of systematic design and its connection to making logical claims about the workings of programs. After an introduction to the ACL2 programming language and theorem prover, offers students an opportunity to redesign interactive games (e.g., “Space Invaders”) and work on turning them into reliable projects. Students who do not meet course prerequisites may seek permission of instructor.

CS 6540. Foundations of Formal Methods and Software Analysis. 4 Hours.
Covers necessary mathematical background such as first-order logic, and some measure theory. Studies the formal methods in more depth and breadth. Discusses the current state of the art in verification and semantics of probabilistic, real-time, and hybrid systems.

CS 6610. Parallel Computing. 4 Hours.
Studies the principles of parallel processing, a variety of parallel computer architecture models including SIMD, MIMD, dataflow, systolic arrays, and network of workstations, and algorithms for parallel computation on the various models. Topics include interconnection network design, memory organization, cache and bus design, processor technologies, algorithms for sorting, combinatorial, and numerical problems, graph algorithms, matrix multiplication, and FFT, and the mapping of these algorithms to different architectures.

CS 6650. Building Scalable Distributed Systems. 4 Hours.
Covers the essential elements of distributed, concurrent systems and builds upon that knowledge with engineering principles and practical experience with state-of-the-art technologies and methods for building scalable systems. Scalability is an essential quality of Internet-facing systems and requires specialized skills and knowledge to build systems that scale at low cost.

CS 6710. Wireless Network. 4 Hours.
Covers both theoretical issues related to wireless networking and practical systems for both wireless data networks and cellular wireless telecommunication systems. Topics include fundamentals of radio communications, channel multiple access schemes, wireless local area networks, routing in multihop ad hoc wireless networks, mobile IP, and TCP improvements for wireless links, cellular telecommunication systems, and quality of service in the context of wireless networks. Requires a project that addresses some recent research issues in wireless and mobile networking.

CS 6740. Network Security. 4 Hours.
Studies the theory and practice of computer security, focusing on the security aspects of multiuser systems and the Internet. Introduces cryptographic tools, such as encryption, key exchange, hashing, and digital signatures in terms of their applicability to maintaining network security. Discusses security protocols for mobile networks. Topics include firewalls, viruses, Trojan horses, password security, biometrics, VPNs, and Internet protocols such as SSL, IPSec, PGP, SNMP, and others.

CS 6750. Cryptography and Communications Security. 4 Hours.
Studies the design and use of cryptographic systems for communications and other applications such as e-commerce. Discusses the history of cryptographic systems, the mathematical theory behind the design, their vulnerability, and the different cryptanalytic attacks. Topics include stream ciphers including shift register sequences; block ciphers, such as DES and AES; public-key systems including RSA, discrete logarithms; signature schemes; hash functions, such as MD5 and SHA1; and protocol schemes including identification schemes, zero-knowledge proofs, authentication schemes, and secret sharing schemes. Discusses key management problems including Needham-Schroeder protocols and certificates.
CS 6754. Secure Wireless Ad-hoc Robots on Mission (SWARM) 1. 4 Hours.
Exposes students to the concepts underlying the design of robust and secure heterogeneous wireless networking of mobile robots: internetworking, security, wireless communication, embedded development, and mobile platform phones. Students in this project-oriented course form mixed teams with the goal of designing and building rescue-mission-oriented heterogeneous wireless systems operating in adversarial environments. These systems consist of off-the-shelf robots enhanced by the students with a low-power control and sensing embedded system; a low-power digital radio frequency communication network; a coordination unit connected to the Internet; and a messaging and command system based on cell phones. The course culminates in a competition between teams. Students are graded based on their designs, presentations, innovation, robustness, and competition performance. Graduate students are expected to make a research contribution.

CS 6756. Secure Wireless Ad-hoc Robots on Mission (SWARM) 2. 4 Hours.
Continues CS 6754. Based on the experiences in CS 6754, student teams have an opportunity to build more autonomous systems that can navigate areas where wireless communication or direct visibility are not possible. The systems must be resilient to more sophisticated denial-of-service attacks and need to more carefully account for energy consumption expended on mobility, communication, and meeting the mission task. Graduate students are expected to make a research contribution.

CS 6760. Privacy, Security, and Usability. 4 Hours.
Challenges conventional wisdom and encourages students to discover ways that security, privacy, and usability can be made synergistic in system design. Usability and security are widely seen as two antagonistic design goals for complex computer systems. Topics include computer forensics, network forensics, user interface design, backups, logging, economic factors affecting adoption of security technology, trust management, and related public policy. Uses case studies such as PGP, S/MIME, and SSL. Introduces basic cryptography and hash function as it is needed. Course work includes analysis of papers, problem sets, and a substantial term project.

CS 6800. Application of Information Theory. 4 Hours.
Introduces information theory and its applications to various computational disciplines. Covers the basic concepts of information theory, including entropy, relative entropy, mutual information, and the asymptotic equipartition property. Concentrates on applications of information theory to computer science and other computational disciplines, including compression, coding, Markov chains, machine learning, information retrieval, statistics, computational linguistics, computational biology, wired and wireless networks, and image and speech processing. The course is self-contained; no prior knowledge of information theory is required or assumed. Requires an undergraduate course in probability.

CS 6810. Distributed Algorithms. 4 Hours.
Covers the design and analysis of algorithms and problems arising in distributed systems, with emphasis on network algorithms. The main concerns are efficiency of computation and communication, fault tolerance, and asynchrony. Topics include leader election, graph algorithms, datalink protocols, packet routing, logical synchronization and clock synchronization, resource allocation, self-stabilization of network protocols, and graph partitions.

CS 6949. Graduate Cooperative Education Seminar. 1 Hour.
Intended to prepare graduate students in computer and information science for co-op. Topics include résumé writing, interviewing, job search strategy, ethics, professional behavior, and the college's co-op policies. Students intending to participate in a co-op or internship must satisfactorily complete this course, which is typically taken during the student's first semester.

CS 6960. Exam Preparation—Master's. 0 Hours.
Offers the student the opportunity to prepare for the master's qualifying exam under faculty supervision.

CS 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CS 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

CS 6965. Co-op Work Experience Abroad. 0 Hours.
Provides eligible students with an opportunity for work experience abroad. May be repeated without limit.

CS 6966. Practicum. 2-4 Hours.
Provides eligible students with an opportunity for practical experience.

CS 7140. Advanced Machine Learning. 4 Hours.
Covers topics in advanced machine learning. Presents materials in the current machine learning literature. Focuses on graphical models, latent variable models, Bayesian inference, and nonparametric Bayesian methods. Seeks to prepare students to do research in machine learning. Expects students to read conference and journal articles, present these articles, and write an individual research paper. CS 7140 and EECE 7397 are cross-listed.

CS 7170. Seminar in Artificial Intelligence. 2-4 Hours.
Gives students the opportunity to read and present various survey and research papers in artificial intelligence. May be repeated for credit for PhD students; faculty supervisor and topics vary from semester to semester.

CS 7180. Special Topics in Artificial Intelligence. 4 Hours.
Offers various topics on artificial intelligence. May be repeated up to two times.

CS 7270. Seminar in Database Systems. 2-4 Hours.
Gives students the opportunity to read and present various survey and research papers in database systems. Faculty supervisor and topics vary from semester to semester. May be repeated for credit for PhD students.

CS 7280. Special Topics in Database Management. 4 Hours.
Offers various topics. Possible areas include object-oriented database systems and distributed database systems. May be repeated up to two times.

CS 7290. Special Topics in Data Science. 4 Hours.
Offers special topics in data science, including machine learning, statistics, data mining, parallel and distributed data analysis, database systems, information retrieval, knowledge representation, information visualization, natural language processing, computational biology and bioinformatics, computational social science, digital humanities, health informatics, business, and predictive analytics. May be repeated once for up to 8 total credits.

CS 7295. Special Topics in Data Visualization. 4 Hours.
Offers various topics in data visualization. May be repeated once.
CS 7370. Seminar in Graphics/Image Processing. 2-4 Hours.
Gives students the opportunity to read and present various survey and research papers in graphics and image processing. May be repeated for credit for PhD students; faculty supervisor and topics vary from semester to semester.

CS 7380. Special Topics in Graphics/Image Processing. 4 Hours.
Offers various topics on graphics/image processing. May be repeated up to two times.

CS 7381. Lab for CS 7380. 0 Hours.
Offers a lab section to accompany CS 7380.

CS 7400. Intensive Principles of Programming Languages. 4 Hours.
Studies the basic components of programming languages, specification of syntax and semantics, and description and implementation of programming language features. Discusses examples from a variety of languages.

CS 7470. Seminar in Programming Languages. 2-4 Hours.
Gives students the opportunity to read and present various survey and research papers in programming languages. Faculty supervisor and topics vary from semester to semester. May be repeated for credit for PhD students.

CS 7480. Special Topics in Programming Language. 4 Hours.
Offers various topics in programming language. May be repeated up to two times.

CS 7485. Special Topics in Formal Methods. 4 Hours.
Offers various topics in formal methods. May be repeated without limit.

CS 7570. Seminar in Software Development. 2-4 Hours.
Gives students the opportunity to read and present various survey and research papers in software development. Faculty supervisor and topics vary from semester to semester. May be repeated for credit for PhD students.

CS 7575. Seminar in Software Engineering. 2-4 Hours.
Gives students the opportunity to read and present various survey and research papers in software engineering. Faculty supervisor and topics vary from semester to semester. May be repeated for credit for PhD students.

CS 7580. Special Topics in Software Engineering. 4 Hours.
Offers various topics on software engineering. May be repeated up to two times.

CS 7600. Intensive Computer Systems. 4 Hours.
Studies the structure, components, design, implementation, and internal operation of computer systems, focusing on the operating system level. Reviews computer hardware and architecture including the arithmetic and logic unit, and the control unit. Covers current operating system components and construction techniques including the memory and memory controller, I/O device management, device drivers, memory management, file system structures, and the user interface. Discusses distributed operating systems, real-time systems, and addresses concurrent processes, scheduling, interprocess communication, and synchronization. Discusses relevant distributed algorithms. Also covers design and analysis techniques for desirable properties in computer systems including functional correctness (in the absence of faults), performance and throughput, fault-tolerance and reliability, real-time response, security, and quality of service. Draws examples from real operating systems. Emphasizes abstraction, while programming exercises are used to facilitate the understanding of concepts.

CS 7670. Seminar in Computer Systems. 2-4 Hours.
Gives students the opportunity to read and present various survey and research papers in computer systems. Faculty supervisor and topics vary from semester to semester. May be repeated for credit for PhD students.

CS 7680. Special Topics in Computer Systems. 4 Hours.
Offers various topics on computer systems. May be repeated up to two times.

CS 7770. Seminar in Computer Networks. 2-4 Hours.
Gives students the opportunity to read and present various survey and research papers in computer networks. Faculty supervisor and topics vary from semester to semester. May be repeated for credit for PhD students.

CS 7775. Seminar in Computer Security. 2-4 Hours.
Gives students the opportunity to read and present various survey and research papers in cryptography and computer security. Faculty supervisor and topics vary from semester to semester. May be repeated for credit for PhD students.

CS 7780. Special Topics in Networks. 4 Hours.
Offers various topics on networks. May be repeated up to two times.

CS 7785. Special Topics in Network Science. 4 Hours.
Covers various topics in network science. May be repeated up to four times.

CS 7800. Advanced Algorithms. 4 Hours.
Presents advanced mathematical techniques for designing and analyzing computer algorithms. Reviews some of the material covered in CS 5800 and then covers advanced topics. Emphasizes theoretical underpinnings of techniques used to solve problems arising in diverse domains. Topics include asymptotic analysis, advanced data structures, dynamic programming, greedy algorithms and matroid theory, amortized analysis, randomized, string matching, algebraic algorithms, and approximation algorithms. Introduces Turing machines, P and NP classes, polynomial-time reducibility, and NP completeness.

CS 7805. Theory of Computation. 4 Hours.
Examines formal models of computation, notions of undecidability, and basic complexity theory. Models of computation include finite state automata, pushdown automata, and Turing machines. Discusses the properties of regular sets and context-free languages. Also covers partial recursive functions, primitive recursive functions, recursively enumerable sets, Turing decidability, and unsolvable problems. Discusses the concept of reductions, time and space complexity classes, and the polynomial-time hierarchy.

CS 7810. Foundations of Cryptography. 4 Hours.
Offers students at the PhD level an accelerated introduction to cryptography and quickly progresses to advanced topics that are at the forefront of current research. Cryptography is the science of protecting information against adversarial eavesdropping and tampering. Examines what kind of security properties can be achieved by relying solely on probability and information theory, without restricting the adversary’s computational power. Studies the complexity-theoretic basis of modern cryptography and the connection between computational hardness and pseudo-randomness. Explores, as the main component of the course, how to take a few well-studied problems in number theory and algebra and use them to build powerful cryptosystems with advanced functionality and security properties. Requires prior completion of an undergraduate course in the theory of computation (Northeastern’s CS 3800 or equivalent).

CS 7870. Seminar in Theoretical Computer Science. 2-4 Hours.
Gives students the opportunity to read and present various survey and research papers in theoretical computer science. May be repeated for credit for PhD students; faculty supervisor and topics vary from semester to semester.
CS 7880. Special Topics in Theories of Computer Science. 4 Hours.
Covers various topics including advanced cryptography, approximation algorithms, computational algebra, formal verification, network algorithms, online computation, parallel computing, and randomness and computation. May be repeated up to two times.

CS 7962. Elective. 2-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CS 7976. Directed Study. 2-4 Hours.
Focuses on student examining standard computer science material in fresh ways or new computer science material that is not covered in formal courses. May be repeated without limit.

CS 7978. Independent Study. 2-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CS 7990. Thesis. 4 Hours.
Offers selected work with the agreement of a project supervisor. May be repeated without limit.

CS 7994. Thesis Continuation—Part Time. 0 Hours.
Offers continued thesis work conducted under the supervision of a departmental faculty. May be repeated without limit.

CS 7996. Thesis Continuation. 0 Hours.
Offers continued thesis work conducted under the supervision of a departmental faculty.

CS 8674. Master's Project. 4 Hours.
Offers selected work with the agreement of a project supervisor. May be repeated once.

CS 8890. PhD Qualifying Examination Completion. 0 Hours.
Indicates that the doctoral student has completed the requirements for the qualifying examination. Restricted to students in the College of Computer and Information Science.

CS 8949. Research Work Experience. 0 Hours.
Provides an opportunity for all doctoral students to engage in industry research in the area of their dissertation. Doctoral students register for this course before starting their off-campus internships. May be repeated without limit.

CS 8960. Exam Preparation—Doctoral. 0 Hours.
Offers the student the opportunity to prepare for the PhD qualifying exam under faculty supervision.

CS 8964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

CS 8982. Readings. 1-8 Hours.
Offers selected readings under the supervision of a faculty member. May be repeated without limit.

CS 8984. Research. 2-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CS 8986. Research. 2-4 Hours.
Offers an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

CS 9000. PhD Candidacy Achieved. 0 Hours.
Indicates successful completion of the doctoral comprehensive exam.

CS 9984. Research. 2-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CS 9986. Research. 2-4 Hours.
Offers an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

CS 9990. Dissertation. 2-4 Hours.
Offers selected work with the agreement of a thesis supervisor. May be repeated without limit.

CS 9996. Dissertation Continuation. 0 Hours.
Continues work with the agreement of a thesis supervisor. May be repeated without limit.

COM 0020. Internet and Information Technology Security. 3 Hours.
Covers Internet concepts, protocols, and security; packet delivery; routing strategies; domain name servers; TCP/IP basics; and management and intelligent agents. Examines e-commerce uses of the Internet, including payment systems, digital money, and secure electronic transactions. Examines Extensible Markup Language (XML), Secure Sockets Layer (SSL), firewalls, and virtual private networks (VPNs), as well as the fundamentals of cryptography and cryptosystems, cryptographic tools and advanced protocols, public key infrastructure and its usages, identity fraud, practical authentication, and authorization services. Examines digital documents, hashing, and watermarking.

COM 0021. Investigating High-Technology Crime. 3 Hours.
Examines concepts and principles in computer forensics and general professional ethics. Emphasizes how to manage digital evidence and how to preserve the scene of the crime. Studies computer forensics examination tools and the use of these tools to analyze digital evidence. Covers privacy, copyright laws, electronic contracts, and computer crime ordinances. On a practical level, offers students an opportunity to learn how to conduct and document a computer forensics examination and how to present evidence in court.

COM 0024. Computer Forensics. 3 Hours.
Introduces the requirements of computer forensics, including operating systems concepts and security issues related to various operating systems. Examines multiboot and multithread systems, the registry structure, and system logging. Also covers file system concepts, disk topology and file structure, boot process, and file operations. Other topics include basic disk cloning and forensic tools; data formats and encoding; and how to search for, analyze, and examine digital data, as well as how to recover and preserve digital evidence. Uses cases to reinforce learning.

COM 0026. Information Security Management and Policy Development. 3 Hours.
Description unavailable.

COM 0380. Introduction to Software Quality Assurance. 2 Hours.
Provides an overview of the role of quality assurance in a software development organization. Introduces the fundamental principles of software quality, international standards, and issues related to establishing a software quality assurance function. Covers current software development paradigms and how SQA relates to these paradigms and an overview of typical tasks performed by SQA. Offers students an opportunity to understand the SQA functions typically performed within a software development organization.
COM 0383. Introduction to Software Testing. 2 Hours.
Introduces the testing process and an overview of basic software testing methodologies and their application to common testing situations. Examines the concepts of black-box and white-box testing, equivalence class partitioning, and boundary value analysis as they relate to functional testing, regression testing, configuration testing, compatibility testing, usability testing, and Web site testing. Offers students an opportunity to understand basic software testing tasks and methodologies sufficiently to contribute meaningfully within a software development organization.

COM 0386. SQA Tool Selection Methodology. 2 Hours.
Provides an overview of techniques to enhance the operation of a software quality organization as well as software development effectiveness. Offers students an opportunity to learn how to select the tools needed to aid the quality assurance function in a software development organization.

COM 0387. Certified Software Quality Engineer (CSQE) Exam Preparation. 3 Hours.
Reviews the seven parts of the new 2002 Body of Knowledge for the ASQ CSQE certification exam, including software quality management, software engineering processes, program and project management, testing, metrics, software configuration management, and more. For those not planning on getting certified, the course’s subject matter can be beneficial for SQA engineers, software testers, or SQA managers who need additional training (or just a refresher) in software quality. Offers students an opportunity to comprehend all the areas of the CSQE Body of Knowledge and be prepared to take the CSQE exam.

COM 0639. C# Programming. 2 Hours.
Explores the syntax, semantics, and capabilities of C# while surveying its applicability to the .NET development model. The .NET platform is Microsoft’s new evolutionary framework for creating Windows-based and Internet-aware software systems. C# is Microsoft’s new language that allows you full, rich access to this new platform.

COM 0646. Linux Red Hat Systems Administration 2. 3 Hours.
Description unavailable.

COM 0774. Disaster Recovery Planning and Implementation. 2 Hours.
Presents a discussion of disaster recovery approaches and options. This course has been created to assist with developing a disaster recovery plan. Recent challenges have many corporations wondering how they would recover from a disaster situation. Imagine if you were contacted at home one evening and informed that your company has experienced a catastrophe rendering the facility uninhabitable. How would you keep the business alive if your facility could not be accessed for three days, three weeks, or for several months? How would you service your customers if your critical data systems and voice lines were down? Requires each student to develop a disaster recovery plan.

COM 0843. LANs, WANs, and Internetworking. 2 Hours.
Offers students an opportunity to gain the knowledge of an end user communications stack and the LAN and WAN knowledge to carry application data end-to-end. Details TCP/IP applications, transport, networking, and packet structure and how this stack and others are delivered to a LAN host. LAN topics include Ethernet and Token Ring operation, framing, and data encapsulation; FDDI campus backbone operation; definitions of Ethernet packet type, LSAP, and SNAP addresses; layer 2 Transparent and Source Route Bridge operation; layer 3 routing operation. WAN switching technologies topics include: X.25, frame, ATM, and routing vs. switching. IP protocol stack details include TCP and IP headers; IP addressing; ARP, ICMP; sample applications; sample TCP session. Assumes a familiarity with the material covered in COM 0830.

COM 0921. Introduction to Oracle Using SQL*Plus. 3 Hours.
Provides an overview of relational database concepts and how to retrieve and manipulate data through standard ANSI Structured Query Language (SQL) and Oracle’s SQL*Plus and Object-Oriented (OO) concepts and terminology. Offers students an opportunity to learn how to query, insert, update, and delete data from an Oracle RDBMS using standard ASNIS SQL and SQL Plus commands to extract and organize information from the database; manipulate information in database tables; create and drop database objects, such as tables, views, indexes, etc. The topics provide the foundation for advancing to Oracle’s Procedural language SQL (PL/SQL) and the design, development, and administration of an Oracle database.

COM 0922. Advanced Oracle Programming with PL/SQL. 3 Hours.
Provides hands-on experience with Procedural Language SQL (PL/SQL), which is the procedural language used in stored procedures, functions, packages, and database triggers. Covers Cursors and Cursor Processing, which are essential in PL/SQL, as well as the PL/SQL block structure, functions, and exception (error) handling in PL/SQL block, which can be embedded in SQL*Plus. Requires some experience with Oracle’s SQL*Plus database access language and with program logic in a standard programming language, such as Basic, C, Fortran, COBOL, etc.

COM 0935. Visual Basic.NET Programming. 3 Hours.
Explores the new language syntax and capabilities of VB.NET. The next generation of the Visual Basic language at Microsoft is designed to be a fast and easy way to create .NET applications, including Windows applications, Web services, and Web applications. Visual Basic.NET fully integrates with the .NET Framework and the Common Language Runtime.

CSYE 6200. Concepts of Object-Oriented Design. 4 Hours.
Introduces object-oriented design and programming via the Java programming language; the use of inheritance, composition, and interface classes in software design; development of Java applets and applications; study of the Java class libraries, including the swing tool kit for building human computer interfaces, the network package for development of client-server systems, and the collections’ package for data structures and sorting algorithms. Requires a course project. Requires knowledge of C programming.

CSYE 6202. Concepts of Object-Oriented Design with C#. 4 Hours.
Introduces object-oriented design and programming via the C# (C-sharp) programming language and its underlying .NET platform. Covers the use of inheritance and composition in software design and development of complex C#.NET applications. Topics include classes, overloading, data abstraction, information hiding, encapsulation, inheritance, polymorphism, file processing, templates, exceptions, container classes, and low-level language features.

CSYE 6205. Concepts of Object-Oriented Design with C++. 4 Hours.
Introduces object-oriented design and programming via the C++ programming language. Covers the use of inheritance and composition in software design and development of complex C++ applications. Topics include classes, overloading, data abstraction, information hiding, encapsulation, inheritance, polymorphism, file processing, templates, exceptions, container classes, and low-level language features. Requires a course project.
CSYE 6210. Component Software Development. 4 Hours.
Covers component-based design, development, and implementation. Emphasizes the reusability, flexibility, scalability, and portability of software components. Covers the JavaBeans Component Model in detail and compares it against competing technologies. Requires a component-based software project.

CSYE 6220. Enterprise Software Design. 4 Hours.
Introduces the hypertext markup language (HTML), cascading style sheets (CSS), CSS3, and HTML5 for the design of Web sites. Coverage of HTML5 includes semantic markup and the following application programming interfaces (APIs): canvas, scalable vector graphics, video, audio, Web storage, Web SQL database, geolocation, Web sockets, and Web workers. Requires a project in which students develop a Web site using CSS3 and HTML5.

CSYE 6225. Network Structures and Cloud Computing. 4 Hours.
Offers a practical foundation in cloud computing and hands-on experience with the tools used in cloud computing. Designed as a foundation course for cloud-aware, adept professionals. Focuses on the fundamentals of cloud computing, the principal areas of cloud architectures, cloud security, cloud governance, cloud storage, cloud virtualization, and cloud capacity. Discusses the Internet evolution that led to cloud and how cloud applications revolutionized Web applications.

CSYE 6230. Operating Systems. 4 Hours.
Covers basic concepts of operating systems and system programming, such as utility programs, subsystems, and multiple-program systems. Main topics include processes, interprocess communication, and synchronization; memory allocation, segmentation, and paging; loading, linking, and libraries; resource allocation, scheduling, and performance evaluation; file systems, storage devices, and I/O systems; and protection, security, and privacy. Emphasizes key concepts through code design and development.

CSYE 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CSYE 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

CSYE 7200. Big-Data System Engineering Using Scala. 4 Hours.
Covers the fundamentals of functional programming with Scala and seeks to provide a basic, practical foundation for students who want to use it as a language for working with big-data platforms. Scala is one of a new breed of general-purpose functional programming languages that is strongly typed and is object oriented. It runs on the Java virtual machine and is able to share libraries from the vast collection of open-source projects written in Java. For these reasons it is readily accessible by programmers of Java, C++, and similar languages.

CSYE 7215. Foundations of Parallel, Concurrent, and Multithreaded Programming. 4 Hours.
Covers all aspects of concurrent program design, development, and implementation utilizing the Java multithreading API/facilities. Topics covered include thread safety and lifetime issues, block structured versus explicit synchronization, intrinsic versus explicit locking, thread pools, liveness issues, deadlock, livelock, race conditions, atomicity, performance and scalability, execution policies, test strategies. Major Java multithreading API/facilities covered include synchronized blocks, wait sets, intrinsic locks and condition variables, synchronized and concurrent collections, executor framework. Comparisons between the Java multithreading API and the Posix Pthreads multithreading standard are provided.

CSYE 7230. Software Engineering. 4 Hours.
Looks at the software life cycle (requirements analysis and specification, software design, coding, testing, and maintenance). Offers verification, validation, and documentation at various stages of the life cycle. Covers the Unified Modeling Language as applied to the software life cycle. Covers applications of design patterns. Overviews user interface design, software metrics, and software development environments. Emphasis is on modular software construction and development of modular libraries. Requires a small software development project.

CSYE 7245. Big-Data Systems and Intelligence Analytics. 4 Hours.
Offers students an opportunity to learn a hands-on approach to understanding how large-scale data sets are processed and how data science algorithms are adopted in the industry through case studies and labs. This project-based course builds on INFO 7390 and focuses on enabling students with tools and frameworks primarily to build end-to-end applications. The course is divided into three parts: building the data pipeline for data science, implementing data science algorithms, and scaling and deploying data science algorithms.

CSYE 7250. Big Data Architecture and Governance. 4 Hours.
Focuses on creating and managing a data-driven enterprise. Geared to current IT technical professionals, data scientists, technical project managers, aspiring IT professionals, and managers who want to understand the complex nature of creating and managing data-driven projects to support the new and legacy data environments. Covers the analysis that is required to design data-driven projects and make appropriate recommendations for the target state of an organization. This analysis is used as input to create a comprehensive road map to achieve the target state and includes current and future uses of data, consumption methods, data sources and categories, and aggregation and quality requirements.

CSYE 7270. Building Virtual Environments. 4 Hours.
Covers the basics of three-dimensional graphics programming using the Unity game engine. Includes a built-in terrain editor; a shader development facility; built-in physics; and advanced lighting, shadows, and audio to build 3D virtual environments and serious games. Javascript and C# can be used for scripting. Assets from various 3D modeling programs can be imported. Facilities to publish to the PC, Mac, iPhone and Wii and support for real-time multiplayer games are available. Requires a final project.

CSYE 7280. User Experience Design and Testing. 4 Hours.
Introduces user experience concepts while working on Web design projects. Offers students an opportunity to build the necessary skill sets to make better decisions when designing contemporary websites that cater to customer needs. Students practice interview techniques to understand user requirements while keeping user experience central to the effort. Uses wireframes and user scenarios to drive the creative design process. Various case studies are introduced and discussed in team settings to emphasize user perspectives. Uses quality assurance and usability testing to drive validation and user-acceptance testing and approvals.

CSYE 7374. Special Topics in Computer Systems Engineering. 4 Hours.
Offers topics of current interest in computer systems engineering. May be repeated without limit.

CSYE 7945. Software Engineering Project. 4 Hours.
Supports teamwork on a large software project under faculty supervision. The projects are drawn from an engineering field, and involve design, systems engineering, manufacturing, planning maintenance, reliability, quality control, risk assessment, project control, evaluation of alternatives, and so on. The project may cover either the whole software development life cycle or a significant part of it.
execute.

identify and practice the leadership skills required for successful project objectives. Uses case studies and real-world examples to and integrated project delivery (IPD) as vehicles to ensure the meeting international projects, contracts, terminations, defaults, and sustainable project closeout; and innovative procurement strategies. Also examines cost and value management; project and program management; project design, including building information modeling (BIM); schedule; operations and control, including estimating, cost control, and change-order management. Students practice scheduling techniques, progress monitoring, and reporting approaches for projects and are introduced to construction organizations, contractor selection, and project procurement.

CMG 6402. Alternative Project Delivery Methods and Project Controls. 4 Hours.

Offers a comprehensive overview of alternative project delivery systems in public and private sectors. Topics include project life cycle; alternative project design, including building information modeling (BIM); schedule; cost and value management; project and program management; project closeout; and innovative procurement strategies. Also examines international projects, contracts, terminations, defaults, and sustainable and integrated project delivery (IPD) as vehicles to ensure the meeting of project objectives. Uses case studies and real-world examples to identify and practice the leadership skills required for successful project execution.

CMG 6403. Safety, Project Risk, and Quality Management. 4 Hours.

Offers students an opportunity to learn how to develop and manage a risk identification, analysis, and response plan. Students look at project participants and several construction processes with a focus on the safety, risk, and quality impacts on those processes. Covers the latest techniques to ensure that a project provides a safe environment for everyone. Studies the analytical tools necessary to ensure customer satisfaction in the area of quality and examines both quality control and assurance processes.

CMG 6405. Construction Law. 4 Hours.

Explores the statutory and legal context of contracts in construction. Covers business ethics and examines the legal issues that may result in bidding mistakes and construction disputes over such matters as differing expectations regarding specifications and plans, time and schedule impacts, delays and acceleration, change orders, and differing and unforeseen conditions. Explores some areas of warranties and guarantees; joint liability; and contract-dispute resolution, including negotiation, alternative dispute resolution, and litigation.

CMG 6961. Internship. 1-4 Hours.

Provides students with an opportunity for internship work. May be repeated without limit.

CMG 6962. Elective. 1-4 Hours.

Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CMG 6964. Co-op. 0 Hours.

Provides eligible students with an opportunity for work experience.

CMG 6966. Practicum. 1-4 Hours.

Provides eligible students with an opportunity for practical experience.

CMG 6970. Seminar. 1-4 Hours.

Offers an in-depth study of selected topics.

CMG 6983. Topics. 1-4 Hours.

Covers special topics in construction management. May be repeated without limit.

CMG 6995. Project. 1-4 Hours.

Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

Cooperative Education (COOP)

COOP 3945. Co-op Work Experience. 0 Hours.

Provides students an opportunity for work experience. Requires sophomore standing or above. May be repeated up to five times.

COOP 3948. Co-op Work Experience Abroad. 0 Hours.

Provides students with an opportunity for work experience abroad. Requires sophomore standing or above. May be repeated up to five times.

COOP 3949. Internship Exchange. 0 Hours.

Offers students an opportunity to participate in an internship experience. May be repeated up to five times.
COP 1002. Internship. 0 Hours.
Offers students an opportunity to engage in an internship to gain practical experience related to their field of study.

COP 2001. Experiential Learning Projects for Undergraduate Students. 0 Hours.
Offers students an opportunity to apply their curricular learnings in an applied project setting. Working with a sponsor, students refine an applied research topic, perform research, develop recommendations that are shared with a partner sponsor, and create a plan for implementing their recommendations. Seeks to benefit students with a curriculum that supports the development of key business communication skills, project and client management skills, and frameworks for business analysis. Offers students an opportunity to learn from sponsor feedback, review “lessons learned,” and incorporate suggestions from this review to improve and further develop their career development and professional plan. May be repeated up to two times.

COP 3940. Personal and Career Development. 3 Hours.
Offers students an opportunity to use co-op experience along with this course to clarify their vision of a successful professional and personal future and identify goals to create that vision; identify strengths, weaknesses, and communication and conflict-management preferences; design a career action plan; and develop and practice articulating professional goals, personal brand, and knowledge and experience gained from co-op. Encourages students to engage in a combination of introspection, critical reflection on experiences in the workplace, and with online collaborative learning and group behavior; learn to identify and analyze career and personal development opportunities in the external environment; and practice communication, relationship-building, conflict management, and leadership skills. This companion course to an internship or co-op requires permission of the CPS Office of Cooperative Education.

COP 3944. Co-op Work Experience—Part Time. 0 Hours.
Offers students an opportunity to engage in work experience that relates to their academic field of study. May be repeated up to four times.

COP 3945. Co-op Work Experience—Full Time. 0 Hours.
Offers students an opportunity to engage in work experience that relates to their field of study. May be repeated without limit.

COP 4500. Experiential Learning Preparation. 0 Hours.
Seeks to help students apply their curricular learnings in an applied project setting. Working with a sponsor, students refine an applied research topic, perform research, develop recommendations that are shared with a partner sponsor, and create a plan for implementing their recommendations. Seeks to benefit students with a curriculum that supports the development of key business communication skills, project and client management skills, and frameworks for business analysis. Offers students an opportunity to learn from sponsor feedback, review lessons learned, and incorporate suggestions from this review to improve and further develop their career development and professional plan.

COP 5001. Preparing for Experiential Learning. 0 Hours.
Seeks to prepare students for an experiential learning placement. Offers students an opportunity to develop a job search strategy, gain greater understanding of their career field and the skills and traits required, and understand the key components of business professionalism. The goal is that the student should gain a greater understanding of the CPS cooperative education and academic internship policies, procedures, and expectations.

COP 5002. Internship. 0 Hours.
Enables students to engage in an internship to gain practical experience relating to their field of study.

COP 5003. Experiential Learning Projects for Graduate Students. 0 Hours.
Offers students an opportunity to apply their curricular learnings in an applied project setting. Working with a sponsor, students refine an applied research topic, perform research, develop recommendations that are shared with a partner sponsor, and create a plan for implementing their recommendations. Seeks to benefit students with a curriculum that supports the development of key business communication skills, project and client management skills, and frameworks for business analysis. Offers students an opportunity to learn from sponsor feedback, review “lessons learned,” and incorporate suggestions from this review to improve and further develop their career development and professional plan. May be repeated up to three times.

COP 6940. Personal and Career Development. 3-4 Hours.
Offers a companion course to an internship or co-op. Offers students an opportunity to use the work experience along with this course to (1) clarify vision of a successful professional and personal future and identify goals to creating that vision; (2) identify strengths, weaknesses, and communication and conflict-management preferences; (3) design a career action plan; and (4) develop and practice articulating professional goals, personal brand, and knowledge and experience gained from the co-op. Encourages students to engage in a combination of (1) introspection; (2) critical reflection on experiences in the workplace and with online collaborative learning and group behavior; (3) learning to identify and analyze career and personal development opportunities in the external environment; and (4) practicing communication, relationship building, conflict management, and leadership skills. Requires permission of the CPS Office of Cooperative Education.

COP 6942. Strategies for Professional Growth. 1 Hour.
Offers students an opportunity to clarify their vision of a successful professional and personal future, identify goals to achieve that vision, develop and negotiate a proposal for an applied project, and assess career growth opportunities. Designed to encourage students to plan and frame a personal and professional growth strategy using internal and external scanning mechanisms, negotiation and persuasion, research, and critical reflection. May be repeated up to three times.

COP 6944. Co-op Work Experience—Part Time. 0 Hours.
Offers students an opportunity to engage in work experience that relates to their academic field of study. May be repeated up to four times.

COP 6945. Co-op Work Experience—Full Time. 0 Hours.
Offers students an opportunity to engage in work experience that relates to their field of study. May be repeated without limit.

COP 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
EXED 2000. Professional Development for Co-op. 1 Hour.
Introduces students to the Cooperative Education Program and provides them with an opportunity to develop job-search and career-management skills. Offers students an opportunity to perform assessments of their workplace skills, interests, and values and discuss how they impact personal career choices. Students also have an opportunity to prepare a professional-style résumé, learn proper interviewing techniques, and gain an understanding of the opportunities available to them for co-op. Introduces career paths, choices, professional behaviors, work culture, and career decision making. Familiarizes students with workplace issues relative to their field of study and teaches them to use myNEU in the job-search and referral process. Presents co-op policies, procedures, and expectations of the Department of Cooperative Education and co-op employers. Restricted to undeclared students only.

EXED 2010. Internship for Career Decision Making. 1 Hour.
Offers students an opportunity to gain experience in a field they would like to explore and receive internship credit. Students complete a one-hundred-hour internship during the semester, which they obtain prior to the course. Students attend group meetings and individual appointments with the instructor, maintain a weekly journal, and complete an evaluation of their internship experience.

EXED 2000. Professional Development for Co-op. 1 Hour.
Introduces students to the Cooperative Education Program and provides them with an opportunity to develop job-search and career-management skills. Offers students an opportunity to perform assessments of their workplace skills, interests, and values and discuss how they impact personal career choices. Students also have an opportunity to prepare a professional-style résumé, learn proper interviewing techniques, and gain an understanding of the opportunities available to them for co-op. Introduces career paths, choices, professional behaviors, work culture, and career decision making. Familiarizes students with workplace issues relative to their field of study and teaches them to use myNEU in the job-search and referral process. Presents co-op policies, procedures, and expectations of the Department of Cooperative Education and co-op employers. Restricted to undeclared students only.

EXED 2010. Internship for Career Decision Making. 1 Hour.
Offers students an opportunity to gain experience in a field they would like to explore and receive internship credit. Students complete a one-hundred-hour internship during the semester, which they obtain prior to the course. Students attend group meetings and individual appointments with the instructor, maintain a weekly journal, and complete an evaluation of their internship experience.

EEAM 2945. College of Arts, Media and Design Co-op Experience. 1 Hour.
Offers students an opportunity for work experience. May be repeated up to three times.

EESC 2000. Professional Development for Co-op. 1 Hour.
Introduces students to the Cooperative Education Program and provides them with an opportunity to develop job-search and career-management skills. Offers students an opportunity to perform assessments of their workplace skills, interests, and values and discuss how they impact personal career choices. Students also have an opportunity to prepare a professional-style résumé, learn proper interviewing techniques, and gain an understanding of the opportunities available to them for co-op. Introduces career paths, choices, professional behaviors, work culture, and career decision making. Familiarizes students with workplace issues relative to their field of study and teaches them to use myNEU in the job-search and referral process. Presents co-op policies, procedures, and expectations of the Department of Cooperative Education and co-op employers.

EESC 2010. Internship for Career Decision Making. 1 Hour.
Offers students an opportunity to gain experience in a field they would like to explore and receive internship credit. Students complete a one-hundred-hour internship during the semester, which they obtain prior to the course. Students attend group meetings and individual appointments with the instructor, maintain a weekly journal, and complete an evaluation of their internship experience.

CAEP 1235. Vocational, Education, and Career Development. 4 Hours.
Intends to provide insight into one’s personal and professional life planning, based on knowledge gained through cognitive and social foundations, the occupational world and work behavior, and career choice and development in individuals and organizations. Focuses on the interactions of economic needs, work, class, education, and contemporary social trends as part of human development in a sociohistorical ecological context.
CAEP 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CAEP 2010. Counseling and Applied Educational Psychology in a Global Context. 4 Hours.
Explores education, college student development, school psychology, and counseling in a global context. Students explore these issues internationally as they are exposed to the current professional standards and practice of fields related to counseling and applied educational psychology. Also studies the impact of the culture of the international site on the profession. Taught abroad. May be repeated without limit.

CAEP 2020. International Perspectives on Student Development and Higher Education Administration. 4 Hours.
Offers students an opportunity to visit colleges and universities abroad and to observe college student development and higher education administration in a global context. Includes lectures conducted by a Northeastern and host-country faculty and administrators on the history of higher education in the international site, the administration of student affairs/services, student development, and other topics as they relate to universities and the community. May be repeated without limit.

CAEP 2899. Introduction to College Student Development and Student Affairs. 4 Hours.
Offers students an opportunity to obtain a basic understanding of the role of the student affairs professional and the theories of college student development that serve as a foundation for practice. Emphasizes the importance of cocurricular educational experiences of students attending institutions of higher education as well as leadership development, problem solving, and career exploration in student affairs.

CAEP 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CAEP 3480. Counseling Theories and Practice. 4 Hours.
Surveys major theoretical approaches to counseling. Provides training and practice in listening skills to aid in the development of facilitative responses. Combines didactic representations and experiential activities to assist in understanding and implementing a variety of counseling approaches. Requires prior completion of one introductory social science course.

CAEP 3483. Counseling Skills for the Helping Professions. 4 Hours.
Introduces the applied and experiential skills used in a wide range of counseling contexts. Counseling is a core skill for human service practitioners. Focuses primarily on developing the trans-theoretical helping skills that underlie the work of successful counselors, social workers, case-managers, psychotherapists, and psychologists. Studies, practices, and applies these skills in a highly experiential, dynamic classroom context. Explores self-reflection, multiculturalism and diversity, professionalism, legal and ethical issues, and career development. Offers students an opportunity to obtain a realistic introduction to work in the counseling field and support in integrating theoretical/academic knowledge of psychology with their own personal orientation toward helping others.

CAEP 3485. Mental Health and Counseling. 4 Hours.
Explores those characteristics that constitute a mentally healthy person, factors in society that impact emotional health, the mind-body relationship, stress, and ways to achieve a higher level of emotional well-being. Offers students the opportunity to work in triads, small groups, and large group discussions. Role-play is utilized where appropriate. Requires prior completion of one introductory social science course.

CAEP 3899. Relationships in College. 4 Hours.
Explores the interpersonal interactions of traditional-age college students with their peers, faculty, roommates, romantic partners, and family. Investigates the implications of relationships on the college student's well-being, growth, and development. Requires students to discuss and analyze the impact of technology on relationships and how it enhances or diminishes effective communication in college. Emphasizes the importance of cultivating relational skills that can be applied in students' postacademic lives.

CAEP 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CAEP 4502. Health Counseling. 3 Hours.
Geared toward students who intend to pursue counseling work in the healthcare field, such as counselors, social workers, trainers, therapists, and administrators. After covering health issues in general, which may call for counseling interventions, the course assists students in becoming more willing and able to reach out to others. From a base of self-understanding, students deepen their human capacity to recognize and respond to the emotional dimensions of many health-related situations. Non-ATP students should also register for CAEP 4503 concurrently.

CAEP 4503. Experiencing Health Counseling. 1 Hour.
Meets in conjunction with CAEP 4502. Gives students additional experience and opportunities to view and practice health counseling in various scenarios and settings, to role-play, and to discuss topics from within their interests in health or mental health. This course is not required for ATP students.

CAEP 4525. Introduction to Professional Psychology. 4 Hours.
Offers students an opportunity to gain an understanding of the roles and functions psychologists have in different work settings and how psychological theory, techniques, and research can be applied in real-world situations. Studies the several different areas of professional psychology, including counseling psychology, school psychology, clinical psychology, early intervention, applied behavior analysis, and organizational psychology. Students also have an opportunity to learn how to prepare themselves for graduate school and how to put together an impressive application to graduate school programs. Intended for advanced undergraduate students who are majoring in psychology or human services or who have taken several courses in psychology and related areas.

CAEP 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CAEP 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

CAEP 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CAEP 5125. Introduction to Statistics in Mental Health and Education. 3 Hours.
Covers basic descriptive data analysis, graphing, exploratory data methods, and introduces hypothesis testing. Introduces addition, basic correlation, and regression techniques. Studies the common statistical analysis software in hands-on computer-lab exercises with examples from community mental health and school settings. Also introduces nonparametric approaches and probability.
CAEP 5150. Early Intervention: Family Systems. 3 Hours.
Introduces students to the theory and practice of family interventions with a diverse population including infants, toddlers, and preschoolers with special needs. Discusses family systems, developmental, coping, crisis, and ecological theories and practices. Teaches assessment and intervention skills. Integrates theories of exceptionality as they pertain to family systems into course material.

CAEP 5151. Early Intervention: Infant and Toddler Development, Risk, and Disability. 3 Hours.
Introduces students to the major theories of development and their implications for intervention. Presents and discusses infant/toddlers’ development, risk, and disability in the areas of cognition, communication, motor skills, social/emotional development, and adaptive skills, and considers variation in development as a result of multiple factors. Is team-taught by professors drawn from school psychology, special education, speech-language pathology, counseling psychology, nursing, and physical therapy.

CAEP 5152. Early Intervention: Planning and Evaluating Services. 3 Hours.
Comprises a systematic, family-centered, team approach to service delivery. Cases are used as a focal point for learning how to plan and evaluate individualized family services and group service plans. Covers important aspects of teamwork and leadership in early intervention with respect to service and coordination. Addresses practical approaches to assessing needs for group programs, and evaluating the implementation and outcomes of programs. Also considers the impact of legal and financial issues on service coordination and approaches to service delivery.

CAEP 5200. Motivational Interviewing in a Healthcare Setting. 3 Hours.
Designed for clinicians working or who hope to work in interdisciplinary healthcare settings. In today’s rapidly changing healthcare climate, positive health behavior change is a priority. Motivational interviewing (MI) is an important evidenced-based clinical approach useful to healthcare providers trying to help patients reduce smoking or substance use, achieve medication adherence, enhance medical therapy engagement, or manage chronic illnesses. Offers participants an opportunity to learn the foundations of MI as well as practice key MI techniques. The curriculum is based on research describing the conceptualization of MI, its principles, empirical evidence for MI, and methods of MI training.

CAEP 6200. Introduction to Counseling: Theory and Process in an Ecological Context. 3 Hours.
Provides an overview of counseling and psychology from the ecological perspective. Covers the history, theories, and process of counseling across forces within psychology and across individuals (children and adults), groups, and families. Includes an introduction to counseling skills.

CAEP 6201. Introduction to Assessment. 3 Hours.
Introduces testing and assessment in psychology and education including group achievement tests. Covers uses of tests in society, the politics and economics of tests, types of tests, test statistics, reliability, validity, item analysis, test construction, new movements in testing, and applications. Introduces descriptive statistics as a basis for understanding the statistical basis for establishing norms, scales, and for understanding approaches to scoring.

CAEP 6202. Research, Evaluation, and Data Analysis. 3 Hours.
Introduces topics in research and evaluation from a consumer perspective. Covers types of research studies and methodologies, philosophical bases for perspectives, research design, evaluation and outcomes assessment, data analysis techniques, clinical and qualitative approaches, and interpretation of research findings.

CAEP 6203. Understanding Culture and Diversity. 3 Hours.
Works from a broad definition of culture and diversity. In addition to traditional culture and ethnic classifications, examines disability, poverty, and gender as culturally defining factors. Also explores the dynamics of culture in social systems, with the perspective of valuing differences in society and sociocultural forces impinging on culture from the ecological perspective.

CAEP 6204. Assessment of Culturally and Linguistically Diverse Children. 3 Hours.
Studies psychoeducational assessment of English-language learners (ELL), including an ecological perspective of the challenges and strengths of ELLs in U.S. schools; research and theory on second language acquisition and its impact on classroom learning and test scores; measurement of language dominance and proficiency; foundations of bilingual education; IDEA (2004) nondiscriminatory evaluation criteria for special education eligibility; how to address IDEA exclusionary clauses in evaluating ELLs for eligibility for each special education criterion, especially specific learning disabilities and communication impairment; linguistic and cultural considerations in the selection of assessment tools (including cultural validity of tests); linguistic and cultural considerations in the evaluation of evidence for evidence-based intervention and the RTI model; and research and methods regarding assessment of ELLs.

CAEP 6206. Learning Principles. 3 Hours.
Provides an overview of the theories of learning, cognition, and emotion. Introduces the major theories and relates them to applications and interventions in psychology and education.

CAEP 6210. Advanced Assessment of Individual Domains. 3 Hours.
Addresses assessment that is clinically useful. Specifically addresses concentrations in the MSCP program. In addition to cognitive and emotional aspects of assessment that relate to counseling of individuals, measures that relate to ongoing clinical intervention may be considered.

CAEP 6215. Groups: Dynamics and Leadership. 3 Hours.
Presents an overview of the functions of supervision, consultation, prevention and psychoeducation programs, workshops, staff training, action research, social change, and working in professional and community associations using principles of advanced group development and dynamics.

CAEP 6218. Infant, Child, and Adolescent Development. 3 Hours.
Provides an overview of development from birth through late adolescence. Covers the major theories of human development from a culturally informed, gender-sensitive ecological orientation. Reviews stages and theories of development from an interdisciplinary perspective and related to implications for learning. Examines cognitive, language, social/emotional, play, and physical aspects of development.

CAEP 6220. Development Across the Life Span. 3 Hours.
Identifies and addresses culturally and gender-sensitive developmental issues throughout the life span, from the conventional stages of childhood through the end of life. Discusses ethnic, economic, gender, relational, and sexual identities, as well as health-medical and aging concerns.

CAEP 6222. Human Sexuality. 3 Hours.
Designed for the twenty-first century and the critical issues that have evolved in the field. Includes current information on issues in human sexuality (and acts as a forum for the discussion of current trends), which may include HIV/AIDS, abortion, ethics and morality in genetic engineering, sex education in the school and home, teen sexuality and pregnancy, personal behaviors, social aspects of acquaintance rape, early sexual experiences, divorce, and remarriage. Allows for the development of counseling skills needed to deal with various issues.
CAEP 6225. Introduction to Clinical Neuropsychology. 3 Hours.
Provides an introduction to the neurological and biological substrata of cognition and behavior. Emphasis is on the application of this understanding to the work of the clinician.

CAEP 6226. Neuropsychological and Ecological Perspectives on Cognitive Assessment. 3 Hours.
Provides a process-oriented analysis and integration of cognitive assessment results within an ecological perspective. Aims to give students analytical tools to assist in diagnostic formulation, treatment planning, and the development of interventions to address areas of difficulty in children and adolescents with learning and behavioral problems, as well as those suspected of neuropsychological involvement. Includes computer-assisted administration and interpretation of test results.

CAEP 6230. Health Issues in Counseling. 3 Hours.
Includes an in-depth exploration of issues relevant primarily to young adults as they begin to make decisions related to their own health behavior and well-being, as these have bearing on them personally, physically, and socially. Topics are timely and critical to the twenty-first century and include health behaviors in sexuality, self-esteem, high-risk behaviors, emotional well-being, alcohol and other drugs of choice including smoking, violence, eating disorders, and others as they become more prevalent as issues for the young adult. Requires students to practice in the clinical setting a minimum of twenty hours per week.

CAEP 6235. Vocational, Education, and Career Development. 3 Hours.
Focuses on the interactions of economic needs, work, class, education, and contemporary social trends as part of human development in a sociohistoric ecological context.

CAEP 6240. Family, School, and Community Systems. 3 Hours.
Addresses the family as a system within an ecological context. Covers parent counseling, the school and family as interactive systems, and school-parent collaboration. Also considers families in early intervention and other family-school interventions.

CAEP 6242. Psychopathology: Diagnosis and Treatment Planning. 3 Hours.
Identifies categories of human difficulty and abnormal behavior through current DSM terminology. Is based in a cultural and gender competent bio-psycho-social model over the life span. Discusses both preventive and individual interventions for each category. Also introduces treatment planning and treatment guidelines.

CAEP 6243. The Severely Disabled. 3 Hours.
Reviews the causes of disabling conditions. Considers the implications of severe multiple disabilities in home, educational, and community settings, and determines ways to prepare and maintain individuals with severe disabilities in these settings. Reviews services provided by a variety of agencies and procedures to access them. Discusses various alternative-to-school programs including vocational programs, and analyzes referral procedures for them.

CAEP 6247. Child and Adolescent Psychopathology. 3 Hours.
Covers DSM-IV and major forms of psychopathology including the neuroses (obsessional states, hysteria, anxiety states, and phobias), the psychoses (schizophrenia, mania, depression, and paranoia), psychosomatic, sociopathy, conduct disorders, organic disorders, and mental retardation. Discusses the relationship between categories of special education disabilities (emotional impairment, autism, and so on) and DSM-IV.
CAEP 6287. Group Counseling. 3 Hours.
Covers group design, dynamics, and leadership as well as their application in a range of mental health group activities. Since the conventional theoretical orientations have been covered in the theory course (CAEP 6200), this course approaches group work through a broader perspective. For example, while expressive groups based in a humanistic tradition and insight gained through psychodynamic and cognitive traditions are in the course, such recent developments as adventure and psychoeducation group work are also included.

CAEP 6290. Reality Therapy. 3 Hours.
Deals with the theory and practice of choice theory and reality therapy. Emphasizes the principles of brief therapy, and provides opportunities to develop implementation plans to use on an individual, group, and systems basis. Utilizes a variety of methods including reading, demonstrations, role-playing, and media. Designed for educators and mental health professionals functioning in a variety of educational and healthcare settings.

CAEP 6300. Introduction to College Student Development. 3 Hours.
Covers various theories and models of college student development and the principles for translating theory into practice. Provides understanding of the demographics of college student populations, the integration of cognitive and affective education, and the creation of community on campus. Includes developmental theories and models pertaining to subdominant groups, such as women, African-Americans, Asian Americans, Latinos, Native Americans, international, gays and lesbians, and disabled persons.

CAEP 6301. Planning and Administering Student Affairs. 3 Hours.
Focuses on assessing developmental needs of college students and designing, delivering, and evaluating educational programs that address those needs. Emphasizes understanding diversity within student and staff populations. Surveys all of the services typically offered by student services departments and divisions. Involves guest lecturers who are department heads within the most important types of student services offices.

CAEP 6302. Law and Ethics in Higher Education. 3 Hours.
Provides an overview of the law as it applies to higher education administration. Emphasis is on those areas affecting the student affairs professional. Covers the current state of the law, as well as the appropriate skills and resources to stay current in an ever-changing field. Also studies the ethical standards of student affairs.

CAEP 6303. Financial Aspects of Higher Education. 3 Hours.
Seeks to provide students of higher education administration with information they need to better understand and participate more effectively in the funding, budgeting, and revenue/expenditure processes in higher education. Examines the role of strategic planning and resource allocation in public and private colleges/universities. Also examines various topics, issues, and current trends in the financial arena of higher education.

CAEP 6305. Special Topics in Higher Education. 3 Hours.
Offers various topics each term the course is offered. Topics are determined by significant events and changes in the field. Can be taken for up to six semester hours as long as topics are different. May be repeated without limit.

CAEP 6307. Contemporary Issues in Higher Education. 3 Hours.
Analyzes and addresses contemporary issues in higher education that arise in student affairs administration and higher education in real time. Offers students an opportunity to analyze, discuss, and synthesize materials from the course in a meaningful way through discussions, writings, and individual presentations.

CAEP 6310. Introduction to Rehabilitation. 3 Hours.
Provides an orientation to the field of rehabilitation including its historical development, legislative involvement, psychological implications, and sociological dimensions. Emphasizes coordinating and integrating services as they relate to the field of rehabilitation as a community process. Focuses on persons with severe disabling conditions.

CAEP 6311. Principles of Medical Rehabilitation. 3 Hours.
Explores the wide spectrum of disabilities that could profit from rehabilitation including orthopedic, neurological, medical, surgical, and mental disabilities. Presents basic principles of medical rehabilitation that practitioners and administrators should know. Discusses psychological aspects of disabilities and uses role-play and small-group facilitation to develop techniques for working in the field of rehabilitation.

CAEP 6324. Programmed Learning. 3 Hours.
Reviews the theoretical and experimental foundations of programmed instruction and errorless learning. Emphasizes the detailed analysis of stimulus control, its measurement, and ways to produce it. Current research on discrimination learning and stimulus equivalence are a major focus.

CAEP 6325. Biological Basis of Mental Retardation. 3 Hours.
Considers the relationship between biological anomalies of the brain and disruption of learning and behavior that occur in individuals with mental retardation and other developmental disabilities. Through the use of case studies and student presentations, reviews a variety of syndromes and conditions associated with behavioral excesses and deficits.

CAEP 6327. Behavior Assessment. 3 Hours.
Provides an in-depth review of observation and measurement techniques in applied behavior analysis. Introduces key elements of behavioral assessment including systematic assessment of preference, and assessment of behavior function through indirect methods, direct methods, and systematic manipulations.

CAEP 6328. Research and Design Methods. 3 Hours.
Reviews principles of operant learning, with an emphasis on basic laboratory research. Studies single-subject experimental design in-depth, emphasizing critical analysis of published research reports and the implementation of these methods in service settings. Requires a feasible experimental design project, with actual or hypothetical data, which must be written in the form of a scientific report.

CAEP 6329. Service Administration. 3 Hours.
Presents a comprehensive overview of general and specific services for individuals with developmental disabilities, from organizational and administrative points of view. Provides in-depth coverage of ethical principles in the design and implementation of behavior analysis services and applied research. Considers issues in staff training, performance management, and program evaluation.

CAEP 6330. Community-Based Treatment. 3 Hours.
Reviews projects and interventions that have successfully provided effective remediation and rehabilitation in community-based settings for individuals with developmental disabilities, emotional and behavioral disorders, and for the developing individual. Includes observation and evaluation of multiple community-based treatment settings to provide breadth of experience. Requires students to practice in the clinical setting a minimum of twenty hours per week.

CAEP 6331. Advanced Learning Seminar 1. 3 Hours.
Covers theoretical underpinnings of operant and respondent conditioning, with emphasis on relating principles of behavior to problems of reinforcement, motivation, comparative psychophysics, and physiological psychology.
CAEP 6332. Advanced Learning Seminar 2. 3 Hours.
Continues the review of theoretical underpinnings started in CAEP 6331.
Includes an introduction to conceptual issues in behavior analysis, for
example, verbal behavior and language development.

CAEP 6333. Advanced Learning Seminar 3. 3 Hours.
Provides an in-depth focus on a specific advanced topic in operant or
respondent conditioning or applied behavior analysis. Topics may include
advanced verbal behavior, aversive control, conditioned reinforcement,
early intervention in autism, and other conceptual issues.

CAEP 6334. Applied Programming Seminar 1. 3 Hours.
Focuses on the systematic application of principles of behavior
analysis to interventions in applied settings. Allows students to design,
test, and evaluate instructional programs for remedial application to
behavior problems and to test instructional theory. Emphasizes the
relationship between behavioral assessment and behavioral intervention.
Provides supervision through the weekly research and data seminar in
collaboration with the student’s project adviser. May be repeated
without limit.

CAEP 6335. Applied Programming Seminar 2. 3 Hours.
Focuses on the practical issues surrounding development of an applied
thesis research topic. Students develop their thesis topic and prepare
a written proposal for their thesis research. Students present the initial
thesis proposal and periodic updates during the weekly seminar. Thesis
committee members are invited to attend their students’ presentations
provide feedback and critique of the developing proposal. May be repeated
without limit.

CAEP 6336. Systematic Inquiry 1. 3 Hours.
Requires each student to collect a comprehensive bibliography on a
significant topic in applied behavioral research and complete a thorough
written review, which typically serves as the introduction to the student’s
thesis. Emphasizes the integration and analysis of experimental findings
and theoretical foundations of the research area, critical evaluation
of current research, and the identification of potentially fruitful future
research. Frequent presentation of current research by students helps
develop their oral communication skills and prepares them for becoming
contributing professionals in the field of behavior analysis.

CAEP 6337. Systematic Inquiry 2. 3 Hours.
Requires each student to collect a comprehensive bibliography on a
significant topic in applied behavioral research and complete a thorough
written review, which typically serves as the introduction to the student’s
thesis. Emphasizes the integration and analysis of experimental findings
and theoretical foundations of the research area, critical evaluation
of current research, and the identification of potentially fruitful future
research. Frequent presentation of current research by students helps
develop their oral communication skills and prepares them for becoming
contributing professionals in the field of behavior analysis.

CAEP 6338. Clinical Practice Supervision. 1-3 Hours.
Offers a seminar for supervision of a clinical experience in practicum,
internship, or fieldwork. Meets on campus with instructor/supervisor and
complements individual supervision at the practice site. May be repeated
for up to 6 total credits.

CAEP 6340. Issues in School Counseling. 3 Hours.
Designed specifically to address issues of school counseling in
the twenty-first century, looking at a comprehensive Pre-K to 12
developmental guidance approach. Covers the Massachusetts Education
Reform Bill, the Massachusetts Comprehensive Assessment System
(MCAS), the curriculum frameworks, and relevant school law and ethics.

CAEP 6345. Learning Problems: Educational, Biological, and Ecological
Perspectives. 3 Hours.
Focuses on learning problems in relation to developmental tasks and
curriculum frameworks including reading and writing. Examines the
types and causes of learning problems and individual learning styles
from constructivist, neuropsychological, and ecological perspectives.
Reviews methods for assessment of physical, emotional, intellectual, and
social development in childhood and adolescence. Emphasizes special
education legislation and current service delivery programs.

CAEP 6347. Behavior Management. 3 Hours.
Covers theory, research, and practice pertaining to management of
behavior in preschool, elementary, and high school classrooms. Presents
development of practical behavioral interventions using a systematic
problem-solving process (including functional behavioral assessment).
Includes skills and techniques of preventing and remediating behavior
problems.

CAEP 6350. Introduction to Cognitive Assessment. 3 Hours.
Introduces cognitive assessment and the relationship of cognitive
theories to assessment. Also includes practice in administering and
interpreting specific tests of cognitive functioning, such as the Wechsler
Scales and the Woodcock-Johnson.

CAEP 6352. Personality Assessment. 3 Hours.
Administers and interprets projective tests, behavior rating scales, and
personality tests. Offers advanced level of integrating results from
different measures in report writing.

CAEP 6353. Curriculum-Based Assessment and Instruction. 3 Hours.
Presents curriculum frameworks (reading, mathematics), developmental
sequences (language), socialization, and life skills as areas of learning
breakdown. Focuses on procedures for evaluating a child’s current level
of understanding and performance in one of these areas, determining
goals of intervention, formulation of individualized education programs
(IEPs), development of instructional plans, and monitoring progress.

CAEP 6354. Social, Emotional, and Behavioral Assessment. 3 Hours.
Uses a problem-solving framework designed to help students to develop
skills in identifying common school-based social, emotional, and
behavioral problems and designing targeted assessment plans. Offers
students an opportunity to gain experience in the administration, scoring,
and interpretation of relevant measures designed to assess children’s
and adolescents’ social, emotional, and behavioral functioning; in the
synthesis of multisource/multimethod data; and in psychological report
writing.

CAEP 6355. School-Based Counseling. 3 Hours.
 Presents school-based counseling across preschool, elementary, middle,
and high school settings. Considers group counseling, crisis intervention,
and school-based prevention programs. Offers an introduction to child
psychotherapy.

CAEP 6360. Consultation and Program Evaluation. 3 Hours.
Overviews different consultation theories including behavioral,
psychodynamic, and systems perspectives. Offers a focus on skill
development with respect to a broad-based and pragmatic approach
to client-centered behavioral consultation. Uses computer networks
and e-mail in client-centered and peer consultation. Offers evaluation of
the implementation and outcomes of consultation and related service
delivery programs.

CAEP 6365. Seminar in School Psychology. 3 Hours.
Covers the philosophical, historical, technical, and school administrative
issues contributing to the professional identity of school psychologists.
Emphasizes ethical standards, public policy, and legislation that impact
school psychology.
CAEP 6370. Seminar in Health Psychology. 3 Hours.
Intended for graduate students in health-related disciplines and professions. Includes the development and history of health psychology and its use in different agencies and locations. Examines the spectrum of theoretical models along with the range of interventions with health psychology. For example, discusses conventional medical and biopsychosocial models as well as wellness and ecological models. Includes levels of intervention, education, and health promotion as well as some of the paradigm, political, and evaluative tensions that exist within behavioral medicine and health psychology.

CAEP 6371. Student Affairs/Services and College Student Development in Ghana. 3 Hours.
Examines the administration of student services/affairs and college student development in institutions of higher education in Ghana, West Africa. Explores issues of access, student development, and higher education administration in the context of Ghanaian culture and society. Offers students an opportunity to engage in a comparative analysis of Ghanaian colleges and universities with those of the United States. Also examines college-community collaborations as they relate to addressing the challenges of this developing African country.

CAEP 6372. Families Over the Life Span. 3 Hours.
Covers issues pertaining to the life span of families and their development and evolution over time. Examines in detail two approaches to family therapy: the narrative family therapy approach and Bowenian family therapy. Involves the presentation of these intervention approaches, including student role-playing.

CAEP 6375. Substance Use and Treatment. 3 Hours.
Covers use, abuse, and treatment of both legal and illegal psychoactive drug agents. Includes an introduction to psychotropic medications, overview of illicit substance use, differential substance abuse, interventions and treatment, and related social issues.

CAEP 6380. Seminar in Feminist Psychology. 3 Hours.
Looks at sex-gender socialization and role ascription in the development of women and men. Examines feminine and masculine gender role stereotypes and constructs in mental health theory, procedures, and practices. Introduces the variety of feminist standpoints and explores their impacts on the conceptualization of health and healing. Presents major points in feminist therapy and psychology. The student examines selected areas in-depth within this course.

CAEP 6382. Advanced Family Therapy. 3 Hours.
Begins with an analysis of the genograms prepared during CAEP 6286. Discusses the usefulness of the genogram and how to include it in the assessment and treatment of a family. Covers the theories and interventions of structural and strategic family therapy. Addresses issues of special events in the family, such as divorce, illness, and special needs, in terms of their effects on family functioning.

CAEP 6390. History and Systems of Psychology. 3 Hours.
Examines the development of psychological theories in the context of western intellectual development. Attends to the underlying epistemological assumptions and historical and cultural forces on psychology. Also emphasizes some of the potential contributions to psychology of other world civilizations and to paradigmic strengths and limits.

CAEP 6394. Advanced Multicultural Psychology. 3 Hours.
Provides critical analyses of "universalist" perspective counseling and development theory. Explores a variety of implications for culturally competent psychological work. Addresses process, procedures, and interventions as well as theory and inquiry. Focuses on individual and cultural differences in counseling and professional psychological services.

CAEP 6399. Clinical Skills in Counseling Psychology. 3 Hours.
Develops self-awareness, communication skills, and therapeutic and practice procedures.

CAEP 6400. Prepracticum in School Psychology. 1 Hour.
Requires a minimum of 75 hours of school-based experience. Designed to orient school psychology graduate students to the school psychology profession and the practicum. Offers students an opportunity to understand the role of the school psychologist and the school environment. Seeks to familiarize students with the range of different school psychological services and the range of students who receive services from school psychologists, including students from different cultures and students with and without disabilities. Emphasizes observational learning. Students must complete the entire prepracticum and submit the documentation of its successful completion prior to beginning the practicum experience.

CAEP 6401. Counseling Children and Adolescents in Schools 1. 3 Hours.
Constitutes the first semester of a two-semester integrated course sequence on child and adolescent counseling interventions. Seeks to give students a foundation in the selection, evaluation, and application of empirically supported counseling interventions for children and adolescents. Topics include individual and group counseling techniques as well as specific clinical issues related to school-age children, families, family-school collaboration, and systems.

CAEP 6402. Counseling Children and Adolescents in Schools 2. 3 Hours.
Constitutes the second semester of a two-semester integrated course sequence on child and adolescent counseling interventions. Seeks to give students a foundation in the selection, evaluation, and application of empirically supported counseling interventions for children and adolescents. Topics include individual counseling techniques as well as specific clinical issues related to school-age children, families, and systems.

CAEP 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CAEP 7000. Qualifying Exam. 0 Hours.
Provides eligible students with an opportunity to take the master’s qualifying exam.

CAEP 7701. Doctoral Seminar in Counseling Psychology. 1 Hour.
Seeks to advance the student’s development as a counseling psychologist based on a scientist-practitioner and ecological model and to ensure that the student is informed regarding the historical and current developments of the discipline of counseling psychology. May be repeated up to three times.

CAEP 7710. Advanced Clinical Assessment. 3 Hours.
Covers contemporary cognitive and personality testing as used in a variety of practice settings. Covers such areas as pain management, risk assessment, and learning styles. PhD students only.

CAEP 7711. Measurement: Advanced Psychometric Principles. 3 Hours.
Offers students an opportunity to gain an understanding of classical and modern test theory as well as to develop the capability to use these theories to develop tests for their own purposes. Topics include test validity, item statistics useful in test construction, score scales and norms commonly used in educational testing, item bias and test bias, and ideas of fairness and equity in educational and psychological testing. Introduces factor analysis as well as the major extensions and alternatives to classical test theory, generalizability theory, and item response theory (latent trait theory).
CAEP 7712. Intermediate Statistical Data Analysis Techniques. 3 Hours.
Emphasizes the use of existing theories and models as a basis for the formation of questions and hypotheses and for designing research to address those questions and hypotheses. Covers the logic of design of research and hypothesis testing, regression, general linear model (GLM), statistical model building and testing, hierarchical regression, and analysis of covariance structures. Emphasizes consideration of power and effects. Requires students to do problems on the computer and/or by hand using data sets assigned in class. Requires prior completion of a course in basic statistics and a course in methods of research design or permission of instructor.

CAEP 7715. Advanced Research and Data Analyses 1. 3 Hours.
Offers the first course in a year-long, two-semester sequence. Studies the relationship between design and analysis in research in the behavioral sciences. Emphasizes the use of existing theories and models as a basis for the formation of questions and hypotheses and for designing research to address them. Covers the logic of design of research, objectivity, and ethical concerns, as well as the role of perspectives on epistemology, such as neopositivism, phenomenology, and pragmatism. Reviews descriptive statistics and correlation techniques to include simple regression and nonparametric methods. Requires students to do problems on the computer and/or by hand using data sets assigned in class. Utilizes SPSS, SAS, and other computer analysis packages including graphic methods of depicting data. Emphasis is on interpretation of the results of quantitative analyses. Emphasizes the analysis of research findings within an ecological context. Student does a research project from a data set and turns in a written report in APA format suitable for publication. Studies how to critique existing published investigations, taking a researcher's perspective. Requires previous graduate work in research methods and statistics. Restricted to PhD students.

CAEP 7716. Advanced Research and Data Analyses 2. 3 Hours.
Investigates techniques and models for exploring research questions and testing hypotheses developed in the first semester. Explores structural and advanced correlational models using linear and nonlinear approaches, multivariate data analysis, psychometric statistical theory and techniques, and qualitative inquiry. Requires considerable hands-on experience with real data sets. Explores qualitative and methodological approaches to ecological analysis of systems and contexts. Requires students to do problems on the computer and/or by hand using data sets assigned in class. Utilizes SPSS and other computer analysis packages including graphic methods of depicting data. Also covers specialized applications (text analysis software, survey design and scoring software, or specialized graphing programs). Students do projects, prepare reports of an analysis from the data set, and turn in a written report in APA format suitable for publication.

CAEP 7720. Advanced Clinical Interventions. 3 Hours.
Considers assessment and intervention from an ecological/systems perspective on a case-by-case basis. Uses individual, group, family, organizational, and community modalities. Emphasizes case conceptualization as a framework for treatment planning and evaluation. Emphasis is on impact of social systems and sociocultural factors. Restricted to PhD students with previous work in group and family counseling.

CAEP 7722. Educational and Psychological Assessment and Interventions with Infants, Toddlers, and Children. 3 Hours.
Introduces students to the theories and practices of educational and clinical interventions with young children, to include play assessment and play therapy. Focuses on the interrelationships between and among developmental domains in the conceptualization and design of interventions. Emphasizes the implementation of interventions in everyday contexts. Restricted to PhD students.

CAEP 7730. Advanced Consultation Seminar. 3 Hours.
Covers theories of consultation in health, mental health, education, and community systems. Organizational structure, power systems, and economic resources are integrated with theories, techniques, and applications of consultation across settings. Explores implications of culture and interdisciplinary perspectives at the community, organizational, and individual levels. Restricted to PhD students with previous course in consultation.

CAEP 7732. Legal and Ethical Issues in Community and Educational Settings. 3 Hours.
Designed to provide a systematic orientation to the ethical and professional issues faced by mental health practitioners in their teaching, research, and practice in a seminar setting. Addresses APA ethical guidelines, legal aspects of psychological practice including licensing, confidentiality in practice and research, historical perspective, supervision and training issues, and current topics of professional concern in counseling and school psychology practice. Considers relevant court decisions affecting psychological practice with children, adults, and family.

CAEP 7741. Advanced Fieldwork 1. 1, 2 Hour.
Offers students training in clinical settings to develop clinical skills in assessment, consultation, and interventions under supervision. Provides support and evaluation of the advanced fieldwork placement that second-year students are involved in throughout the year. Offers a seminar format, which is led by a faculty supervisor who is the official liaison between Northeastern University and the advanced fieldwork sites. The major objectives are an examination and support of clinical work within various assessment and treatment modalities; and an examination of systems issues within placement sites, which include but are not limited to administrative and supervisory issues. Students submit tapes and detailed process notes of sessions, videotape role-playing, and critique the tapes and videos, offering one another feedback in terms of each student's previously stated goals. Group discussion of clinical/systems issues focus on critical analysis and provision of a supportive atmosphere to explore treatment and systems issues. Requires students to practice in the clinical setting a minimum of twenty hours per week. May be repeated once for up to 2 total credits.

CAEP 7742. Advanced Fieldwork 2. 1, 2 Hour.
Continues CAEP 7741. Provides students the opportunity, under supervision in a clinical setting, to develop clinical skills in assessment, consultation, and interventions. Designed to provide support and evaluation of the advanced fieldwork placement for second-year students. Uses a seminar format led by a faculty supervisor who is the official liaison between Northeastern University and the advanced fieldwork sites. Seeks to examine and support clinical work and examine systems issues within placement sites, which include but are not limited to administrative and supervisory issues. Students submit tapes and detailed process notes of sessions, videotape role-playing, and critique the tapes and videos in terms of each student's previously stated goals. Group discussion of clinical/systems issues focus on critical analysis and provision of a supportive atmosphere to explore treatment and systems issues. Requires students to practice in the clinical setting a minimum of twenty hours per week. May be repeated once for up to 2 total credits.

CAEP 7743. Advanced Fieldwork 3. 1, 2 Hour.
Continues CAEP 7742. May be taken by students who elect to do additional fieldwork to develop better, or deeper, skills or new skill areas. Requires students to practice in the clinical setting a minimum of twenty hours per week. May be repeated once for up to 2 total credits.
Counseling and Applied Educational Psychology (CAEP)

CAEP 7744. Advanced Fieldwork 4. 1,2 Hour.
Continues CAEP 7743. Requires students to practice in the clinical setting a minimum of twenty hours per week. May be repeated once for up to 2 total credits.

CAEP 7746. Neuropsychological Practicum Supervision 2. 2 Hours.
Trains students in neuropsychological assessment of young and middle-aged adults. Under supervision, students conduct interviews, administer and score tests, write interpretive reports focusing on strengths and weaknesses, and provide recommendations and client feedback. Students must commit to both practicums.

CAEP 7750. Biological Bases of Behavior. 3 Hours.
Lays the foundations for an understanding of brain-behavior relations, with an emphasis on implications for the clinician. Topics include basic neuroanatomy, the development of the nervous system over the life span, and hormonal and neuropharmacological aspects of behavioral regulation. Reviews perceptual and motor systems, cognition, emotions, and motivational states from the perspective of their biological underpinnings. Underscores the unfolding of these processes within a psychosocial and cultural context.

CAEP 7751. Advanced Clinical Neuropsychology. 3 Hours.
Reviews common neuropathological conditions from a biopsychosocial perspective. Emphasizes characteristic behavioral presentations, underlying neurobiological processes, and the role of neuropsychological assessment methods in the diagnostic process. Discusses therapeutic interventions, with an emphasis on those most relevant to counselors and rehabilitation specialists. Stresses the importance of incorporating an understanding of cultural, ethnic, and societal factors. Restricted to PhD students.

CAEP 7752. Neuropsychological Practicum Supervision 1. 2 Hours.
Trains students in neuropsychological assessment of young and middle-aged adults. Under supervision, students conduct interviews, administer and score tests, write interpretive reports focusing on strengths and weaknesses, and provide recommendations and client feedback. Students must commit to both practicums.

CAEP 7755. Cognitive and Affective Bases of Behavior. 3 Hours.
Provides students with an in-depth treatment of the theories of the cognitive and affective bases of behavior and their applications. Reviews the impact of thinking, emotions, affect, and temperament on behavior in the context of the ecological model. Restricted to PhD students.

CAEP 7756. Social Psychology in an Organizational and Ecological Context. 3 Hours.
Conducted as a seminar designed to meet the needs of doctoral students in school and counseling psychology for a course that spans theory and principles of social psychology from early work in the field-in such topics as social pressure, field theory, cognitive dissonance, and attitude formation-to more modern work in expectations, attitudes, and organizational behavior. Surveys basic concerns in social psychology, and considers material related to application in schools, communities, and organizations in which mental health is practiced. For example, in the study of group dynamics, stresses applications to group learning, administrative leadership, and organization theory. Also covers research paradigms, social change, social influence, system consultation, and community issues as they relate to social psychological considerations. Restricted to PhD students.

CAEP 7758. Doctoral Seminar in Contemporary Theories of Psychotherapy. 3 Hours.
Offers a critical examination from an ecological/systems perspective of conceptual developmental and clinical elements of contemporary psychotherapy theories. Emphasis is on object relations, social constructionist, and constructivist theories of personality and therapeutic change. Includes selected theoretical and research readings, lectures in student-led discussion. Evaluates critical issues and future directions of contemporary theoretical schools and considers varied approaches to case examples. The different theoretical approaches are examined through the lenses of gender, class, and cultural adequacy. Restricted to PhD students.

CAEP 7759. Seminar in Cultural and Ecological Perspectives in Professional Psychology. 3 Hours.
Should be taken in the last year of doctoral course work when the majority of other course work has been accomplished. The course goals reflect this more mature standing. They include expanding knowledge of multiple facets and developing professional identity(s) in school and counseling psychology; enhancing capacities for critical analyses; and developing the implications of the ecological model of psychology. Offered as a seminar, which aims to help students’ transition from students’ perspectives to professional perspectives. Is designed to articulate multiple professional roles, particularly within an ecological context. Extensive reading and discussion provide the background for individual selection of topics. Restricted to PhD students.

CAEP 7760. Doctoral Seminar in Vocational Psychology and Career Counseling. 3 Hours.
Examines the range of knowledge considerations that causally influence human vocational, occupation, and career choice(s) over the life span. Such considerations include physical, psychological, sociological, geographical, economic, and cultural factors. A general model for data collection and consultation with clients of varying ages and backgrounds is analyzed. Its application shall be further demonstrated in simulated microcounseling sessions. Requires students to make seminar presentations on selected topics stated above. Restricted to PhD students.

CAEP 7770. Topical Seminar in School and Counseling Psychology. 1 Hour.
Offers emerging issues in school and counseling psychology. Restricted to PhD students. May be repeated without limit.

CAEP 7771. Research Team Experience 1. 1 Hour.
Offers the first in a sequence of six semester-long courses designed to give students practical experience in research as part of their doctoral training. The rationale is that to become a researcher requires active research experience. This sequence offers students an opportunity to participate in various stages of ongoing research leading up to and including the design of their own research projects. At each stage, the students are given additional responsibility for conceptualization, design, implementation, analysis, and interpretation of research. Students are encouraged to tie their research to other aspects of their training as appropriate. A faculty mentor provides direct supervision to the students. Restricted to PhD students.
CAEP 7772. Research Team Experience 2. 1 Hour.
Offers the second in a sequence of six semester-long courses designed to
give students practical experience in research as part of their doctoral
training. The rationale is that to become a researcher requires active
research experience. This sequence offers students an opportunity
to participate in various stages of ongoing research leading up to and
including the design of their own research projects. At each stage, the
students are given additional responsibility for conceptualization, design,
implementation, analysis, and interpretation of research. Students are
couraged to tie their research to other aspects of their training as
appropriate. A faculty mentor provides direct supervision to the students.
Restricted to PhD students.

CAEP 7773. Research Team Experience 3. 1 Hour.
Offers the third in a sequence of six semester-long courses designed to
give students practical experience in research as part of their doctoral
training. The rationale is that to become a researcher requires active
research experience. This sequence offers students an opportunity
to participate in various stages of ongoing research leading up to and
including the design of their own research projects. At each stage, the
students are given additional responsibility for conceptualization, design,
implementation, analysis, and interpretation of research. Students are
couraged to tie their research to other aspects of their training as
appropriate. A faculty mentor provides direct supervision to the students.
Restricted to PhD students.

CAEP 7774. Research Team Experience 4. 1 Hour.
Offers the fourth in a sequence of six semester-long courses designed to
give students practical experience in research as part of their doctoral
training. The rationale is that to become a researcher requires active
research experience. This sequence offers students an opportunity
to participate in various stages of ongoing research leading up to and
including the design of their own research projects. At each stage, the
students are given additional responsibility for conceptualization, design,
implementation, analysis, and interpretation of research. Students are
couraged to tie their research to other aspects of their training as
appropriate. A faculty mentor provides direct supervision to the students.
Restricted to PhD students.

CAEP 7775. Research Team Experience 5. 1 Hour.
Offers the fifth in a sequence of six semester-long courses designed to
give students practical experience in research as part of their doctoral
training. The rationale is that to become a researcher requires active
research experience. This sequence offers students an opportunity
to participate in various stages of ongoing research leading up to and
including the design of their own research projects. At each stage, the
students are given additional responsibility for conceptualization, design,
implementation, analysis, and interpretation of research. Students are
couraged to tie their research to other aspects of their training as
appropriate. A faculty mentor provides direct supervision to the students.
Restricted to PhD students.

CAEP 7776. Research Team Experience 6. 1 Hour.
Offers the sixth in a sequence of six semester-long courses designed to
give students practical experience in research as part of their doctoral
training. The rationale is that to become a researcher requires active
research experience. This sequence offers students an opportunity to
participate in various stages of ongoing research leading up to and
including the design of their own research projects. At each stage, the
students are given additional responsibility for conceptualization, design,
implementation, analysis, and interpretation of research. Students are
couraged to tie their research to other aspects of their training as
appropriate. A faculty mentor provides direct supervision to the students.
Restricted to PhD students.

CAEP 7777. Doctoral Seminar: Program Planning and Evaluation. 3 Hours.
Offers students an opportunity to develop knowledge and skills in
program planning and evaluation with a specific focus on promoting
the health of children and adolescents. Focuses on program planning
and evaluation within the coordinated school health model and the
importance of planning, implementing, and evaluating programs
within a community-based participatory research (CBPR) framework.
Emphasizes the importance of programs that incorporate the intersection
of family, school, and community systems. Builds upon the systematic,
problem-solving approach to practice woven throughout the curriculum.
Emphasizes participatory and context-sensitive approaches to planning
and evaluating programs. Seeks to prepare psychologists to plan and
evaluate programs systematically in their future work settings.

CAEP 7778. Doctoral Seminar: Leadership, Consultation, and
Supervision. 3 Hours.
Seeks to provide both knowledge and skills necessary to engage in
leadership, consultation, and clinical supervision activities with respect
to groups and organizations in a doctoral-level course. Focuses on the
nexus of knowledge and skills that pertain to leadership, consultation,
and clinical supervision, which can be considered "indirect" approaches
to improving service delivery. They help set the organizational, problem-
solving, and interpersonal conditions for others to actualize their
potential to (a) provide services to children, families, and adults; (b)
develop and implement applied research programs; and (c) successfully
collaborate across family, school, and community systems. Considers
the empirical basis for leadership, consultation, and clinical supervision
within a multicultural and ecological context.

CAEP 7798. Doctoral Internship 1. 1-3 Hours.
Required of all doctoral students in counseling/school psychology PhD
programs. Requires a minimum of forty hours per week for twelve months
or twenty hours per week for twenty-four months in an accredited (or
equivalent by permission) mental health training setting. In addition
to internships site supervision and training seminars, interns attend,
in person or online, a university-based seminar and complete case
assignments. Restricted to PhD students. May be repeated up to two
times for up to 3 total credits.

CAEP 7799. Doctoral Internship 2. 2 Hours.
Continues CAEP 7798. Restricted to PhD students.

CAEP 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions.
May be repeated without limit.

CAEP 7976. Directed Study. 1-4 Hours.
Allows students to pursue topics of individual interest beyond the scope
of formal course work under the direction of faculty. May be repeated
without limit.

CAEP 7978. Independent Study. 1-4 Hours.
Allows the graduate student to pursue an individualized scholarly project
with a faculty member. May be repeated without limit.

CAEP 7990. Thesis Research. 3 Hours.
Provides supervision and oversight of thesis research through seminars
in which students present updates of ongoing work to invited faculty,
peers, and guests. May be repeated without limit.

CAEP 7996. Thesis Continuation. 0 Hours.
Offers continuation of thesis work under faculty supervision until thesis
is accepted.

CAEP 8401. Practicum in Counseling Psychology. 3 Hours.
Includes forty hours of client contact plus supervision. Focuses on
developing individual and group skills within mental health and human
service agencies.
CAEP 8402. College Student Development Practicum 1. 3 Hours.
Offers the first course in a two-semester sequence that involves placement in a field setting from September to June. The student performs three hundred hours of fieldwork over the course of the academic year. Also requires attendance at a weekly practicum seminar.

CAEP 8403. College Student Development Practicum 2. 3 Hours.
Offers the second course in a two-semester sequence that involves placement in a field setting from September to June. The student performs three hundred hours of fieldwork over the course of the academic year. Also requires attendance at a weekly practicum seminar.

CAEP 8405. Practicum in Rehabilitation Counseling 1. 3 Hours.
Offers the first course in a two-semester sequence that provides a minimum of six hundred hours of supervised practical experience in a rehabilitation counseling service setting over two semesters.

CAEP 8406. Practicum in Rehabilitation Counseling 2. 3 Hours.
Offers the second course in a two-semester sequence that provides a minimum of six hundred hours of supervised practical experience in a rehabilitation counseling service setting over two semesters.

CAEP 8410. School Counseling Practicum 1. 3 Hours.
Offers the first course in a two-semester sequence that provides a 525-hour experience in a selected school (PreK-9 or 5-12). Practica involve direct experience working with children, teachers, parents, and community leaders. The first seventy-five hours of this course represent prepracticum experiences. Requires students to practice in the clinical setting a minimum of twenty hours per week. Requires passing score on the communication and literacy tests of the Massachusetts Tests for Educator Licensure (MTEL).

CAEP 8411. School Counseling Practicum 2. 3 Hours.
Offers the second course in a two-semester sequence that provides a 525-hour experience in a selected school (PK–9 or 5–12). Involves direct experience working with children, teachers, parents, and community leaders. Requires students to practice in the clinical setting a minimum of 20 hours per week.

CAEP 8415. Practicum in School Psychology 1. 2 Hours.
Offers supervised school-based field experience coupled with seminar class. Requires passing score on the communication and literacy tests of the Massachusetts Tests for Educator Licensure (MTEL).

CAEP 8416. Practicum in School Psychology 2. 2 Hours.
Offers supervised school-based field experience coupled with seminar class.

CAEP 8417. Intensive Practicum in Applied Behavior Analysis 1. 2 Hours.
Offers students supervised experience that is required in order to sit for the BACB exam. Focuses on offering students an opportunity to acquire new behavior analytic skills related to the BACB Task List. Asks students to demonstrate the necessary skills to be a competent behavior analyst in applied settings. Covers preference assessments, task analysis and other skill acquisition programs, and other teaching strategies.

CAEP 8418. Intensive Practicum in Applied Behavior Analysis 2. 2 Hours.
Continues the work of CAEP 8417 with the primary focus on offering students an opportunity to acquire new behavior analytic skills related to the BACB Task List. Covers functional assessment; behavior reduction programs, conditioned reinforcement, data analysis, and clinical decision making.

CAEP 8420. Practicum in Special Education. 3 Hours.
Offers a field-based experience in the role and at the level of the license sought. Requires 300 hours, appropriate to the level sought, divided equally between a general education classroom and a setting with students with moderate disabilities. Alternatively, all 300 hours may be pursued in an inclusive setting. Requires passing grade on the subject test for moderate disabilities in addition to the communication and literacy tests of the Massachusetts Tests for Educator Licensure (MTEL).

CAEP 8424. Special Education Practicum 1. 2 Hours.
Provides students from school psychology, special education, speech-language pathology and audiology, physical therapy, nursing, and related fields with supervised field work experience in team-oriented interventions for infants and toddlers with disabilities or at risk for developmental delays and their families from linguistically and culturally diverse backgrounds. The practicum class sessions are conceptualized as the linchpin training experience between what the theory addresses in didactic courses and the student’s fieldwork. Students are expected to master early intervention and team participation core competencies to work effectively with infants and toddlers and their families, interdisciplinary team members, and administrative personnel.

CAEP 8425. Early Intervention Practicum 1. 2 Hours.
Provides students from school psychology, special education, speech-language pathology and audiology, physical therapy, nursing, and related fields with supervised field work experience in team-oriented interventions for infants and toddlers with disabilities or at risk for developmental delays and their families from linguistically and culturally diverse backgrounds. The practicum class sessions are conceptualized as the linchpin training experience between what the theory addresses in didactic courses and the student’s fieldwork. Students are expected to master early intervention and team participation core competencies to work effectively with infants and toddlers and their families, interdisciplinary team members, and administrative personnel.

CAEP 8426. Early Intervention Practicum 2. 2 Hours.
Provides students from school psychology, special education, speech-language pathology and audiology, physical therapy, nursing, and related fields with supervised field work experience in team-oriented interventions for infants and toddlers with disabilities or at risk for developmental delays and their families from linguistically and culturally diverse backgrounds. The practicum class sessions are conceptualized as the linchpin training experience between what the theory addresses in didactic courses and the student’s fieldwork. Students are expected to master early intervention and team participation core competencies to work effectively with infants and toddlers and their families, interdisciplinary team members, and administrative personnel.

CAEP 8501. Internship in School Psychology 1. 3 Hours.
Offers supervised school-based field experience coupled with seminar class.

CAEP 8502. Internship in School Psychology 2. 3 Hours.
Offers supervised school-based field experience coupled with seminar class.

CAEP 8510. Internship in Counseling Psychology 1. 3 Hours.
Provides twenty hours per week in a field setting and a two-hour seminar on campus. In addition to providing supervising seminar, addresses practices, procedures, ethics, and policies in professional practice.

CAEP 8511. Internship in Counseling Psychology 2. 3 Hours.
Provides twenty hours per week in a field setting and a two-hour seminar on campus. In addition to providing supervising seminar, addresses practices, procedures, ethics, and policies in professional practice.

CAEP 8550. Advanced Fieldwork in Counseling Specialty 1. 2 Hours.
Provides advanced field experience in counseling for students beyond a master's degree in counseling or with approval supervision. Students work in specialty setting for a minimum of twenty hours per week.

CAEP 8551. Advanced Fieldwork in Counseling Specialty 2. 2 Hours.
Provides advanced field experience in counseling for students beyond a master's degree in counseling or with approval supervision. Students work in specialty setting for a minimum of twenty hours per week.

CAEP 8552. Advanced Fieldwork in Counseling Specialty 3. 2 Hours.
Provides advanced field experience in counseling for students beyond a master's degree in counseling or with approval supervision. Students work in specialty setting for a minimum of twenty hours per week.
CAEP 8553. Advanced Counseling Practicum. 1,2 Hour.
Offers an elective course for doctoral students in the counseling psychology doctoral program who are completing additional years of supervised practical experience (minimum of 20 hours per week for 600 hours) as part of the training for the PhD degree and in clinical preparation for the APPIC/APA internship match process. Offers students training in clinical settings. Includes a seminar to offer students an opportunity to develop clinical skills in assessment, consultation, and interventions under supervision. Provides support and evaluation of the advanced fieldwork placement in which doctoral students are involved throughout the year. Led by a faculty supervisor who is the official liaison between Northeastern University and the advanced fieldwork sites. May be repeated up to five times for up to 6 total credits.

CAEP 9000. Comprehensive Exam. 0 Hours.
Indicates successful completion of the doctoral comprehensive exam.

CAEP 9990. Dissertation. 0 Hours.
Offers dissertation supervision by individual members of the department. Restricted to PhD students. May be repeated once.

CAEP 9996. Dissertation Continuation. 0 Hours.
Supports the continued development of the dissertation. May be repeated without limit.

Counseling Psychology, Rehabilitation, and Special Education - CPS (CRS)

CRS 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

CRS 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

CRS 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

CRS 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

Criminal Justice (CRIM)

CRIM 1000. Criminal Justice at Northeastern. 1 Hour.
Designed to help students adjust to college life and become fully acquainted with the resources and services offered by the University. Covers various campus services, studies how to access various library resources, and focuses on study skills and time management. Also explores various careers for which the criminal justice major can prepare students.

CRIM 1100. Introduction to Criminal Justice. 4 Hours.
Surveys the contemporary criminal justice system in the United States. Students examine the phases of the criminal justice system beginning with the detection of crimes by the police, the handling of the case through the courts, and, finally, the disposition and sentencing of offenders. Issues and characteristics of each of the phases (police, courts, and corrections) are examined as well as identifying the key actors (police, judges, prosecutors, correctional officers, and so forth) of each phase of the criminal justice system. Also introduces students to the U.S. juvenile-justice system.

CRIM 1200. Ethics, Values, and Diversity. 4 Hours.
Focuses on the ethical dilemmas facing key actors in the criminal justice system. Also examines the increasing diversity of society and how these changes are affecting the criminal justice system. Investigates the myths and realities surrounding race, gender, social class, and crime, and the roles these issues have played in criminal sentencing particularly involving the death penalty. Investigates ethical dilemmas faced by police, courts, and correctional authorities in dealing with an increasingly multicultural society.

CRIM 1300. The Death Penalty. 4 Hours.
Reviews the history of the death penalty in the United States from colonial times through the present. Among Western democracies, the United States stands alone in its continued use of capital punishment as a sanction. Examines the contemporary death penalty and the many controversies surrounding its continued use (focusing on U.S. Supreme Court decisions around the constitutionality of the death penalty). Discusses historical and contemporary controversies around the administration of the death penalty including potential innocence, special populations, methods of execution, race and gender biases, costs, deterrence, and international relations.

CRIM 1400. Human Trafficking. 4 Hours.
Offers an overview of human trafficking in its various forms. Emphasizes understanding the experiences and needs of trafficking victims and the methods of operations of traffickers and their networks across various cultural contexts. The trafficking of persons for sex or labor through force, fraud, or coercion has become an increasingly serious problem in modern society. Federal, state, and local criminal justice authorities have been tasked with the responsibility of identifying and rescuing trafficking victims and prosecuting their perpetrators. Offers students an opportunity to critically evaluate the social and cultural practices that give rise to and support human trafficking in the United States and around the globe.

CRIM 1500. Corruption, Integrity, and Accountability. 4 Hours.
Traces the history, nature, and current effects of corruption using concrete cases and illustrations. Covers international and national laws and standards against corruption (with special emphasis on the U.N. Convention against Corruption and the Foreign Corrupt Practices Act). Discusses efforts to measure corruption, governance, and anticorruption efforts. Focuses on the role of stakeholders from private sector to government, civil society, and individual actors. Corruption affects every aspect of our life and its quality. From bribery and illicit enrichment to obstruction of justice, from abuse of power to clientelism and favoritism, corrupt acts touch global, national, and local communities. Illustrates how fundamental are the values and practice of integrity, responsibility, and accountability.

CRIM 1600. Crimes against Humanity. 4 Hours.
Focuses on human rights and abuses of those rights, including torture, war crimes, genocide, and other crimes against humanity. Uses historical and contemporary examples of crimes against humanity to identify the nature and essence of human rights abuses. Discusses the response of international organizations (the United Nations); international tribunals (such as the International Criminal Court); human rights non-governmental organizations, or NGOs (Human Rights Watch); and national governments (in particular, the United States) to critically examine the difficulties in developing appropriate responses and solutions to such international crimes.
CRIM 1700. Crime, Media, and Politics. 4 Hours.
Discusses and critiques contemporary portrayals of crime and justice in the arenas of political debates and campaigns; news reports; and films, television shows, and music. Covers current events as they occur in these arenas. To set up these discussions, students have an opportunity to develop critical tool kits for assessing these images of crime and justice by reading and discussing theories, research, and critiques. Additionally, students are expected to read and discuss historical portrayals of crime and justice with the goal of identifying both parallels and differences between these and current events.

CRIM 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CRIM 2000. Co-op Integration Seminar 1. 1 Hour.
Orients students for co-op. Offers an overview of how to prepare résumés, practice interviewing skills, consider what students can/should expect from their first co-op, and discuss what employers’ expectations are likely to be of them. Prepares students to integrate what they learned in the freshman diversity course into their first co-op. Students are also instructed on how systematically to prepare a journal during the first co-op on issues related to ethics, values, and diversity.

CRIM 2100. Criminal Due Process. 4 Hours.
Focuses on an historical evaluation of the Fourteenth Amendment of the U.S. Constitution and its use in making rights prescribed under the Bill of Rights applicable to the individual states. Examines constitutional requirements in the administration of criminal justice with particular emphasis on the Fourth, Fifth, and Sixth Amendment requirements and their implications on police practices in the areas of arrests, searches and seizures, right to counsel, and eyewitness identification. Expects students to be familiar with basic concepts and legal language as well as the Court’s changing interpretations of the law. Briefing of cases is required.

CRIM 2200. Criminology. 4 Hours.
Describes the nature and extent of crime, explains its causes, and examines the reasons for and effectiveness of society’s responses to it. Defines the topic of criminology by discussing the different types of crime. Moreover, to establish the extent of crime in society, measurement issues are addressed. The second half of the course details different theories of criminal causation.

CRIM 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CRIM 2991. Research Practicum. 2-4 Hours.
Involves students in collaborative research under the supervision of a faculty member. Offers students an opportunity to learn basic research methods in the discipline. Requires permission of instructor. May be repeated once for up to 4 total credits.

CRIM 3000. Co-op Integration Seminar 2. 1 Hour.
Continues CRIM 2000. Allows students to reflect on what they learned during their first co-op, and use their journal entries as the basis from which to examine real-life issues of ethics, values, and diversity as they experienced them in the workplace.

CRIM 3010. Criminal Violence. 4 Hours.
Surveys the trends, nature, patterns, and causes of criminal violence. Blending sociological and psychological perspectives on violent criminal behavior, focuses on serial and mass murder, sexual predators, youth and school violence, violence among intimates and family members, as well as the impact of media and entertainment violence. The effectiveness of various criminal justice responses are also examined including intervention strategies, police tactics, gun control, incarceration, and capital punishment.

CRIM 3020. Victims of Crime. 4 Hours.
Examines current theories and research relating to victims of crime. Pays particular attention to special victim groups such as children, the elderly, and women. Explores victim interactions with the criminal justice system. Current victim initiatives such as restitution, mediation, compensation, and victim rights legislation are also assessed.

CRIM 3030. Global Criminology. 4 Hours.
Seeks to strengthen an understanding of crime and its causes from a comparative, cross-national standpoint. In doing so, it places extant definitions of crime and deviance in a cultural context. Explores existing methods of studying crime on a global scale; offers an overview of various types of criminal and deviant behavior that occur in isolated group contexts as well as those crimes that transcend country boundaries. Examines various strategies designed to address these acts of crime on a national as well as transnational level.

CRIM 3040. Psychology of Crime. 4 Hours.
Explores the inner lives of offenders including cognitive, emotional, perceptual, and physiological phenomena. Examines the ecological context of crime, individual and social risk factors for psychological attributes related to offending, how these attributes develop, how they interact with the environment to produce crime, and, most importantly, how knowledge of the psychology of crime can assist in efforts to prevent delinquency or to help offenders desist.

CRIM 3050. Organized Crime. 4 Hours.
Examines myths and realities surrounding organized crime. Offers an overview of the nature and extent of organized crime, the factors that contribute to it, as well as the origins and opportunities/motives for criminal enterprises. Discusses the impact of organized crime on U.S. society, both in terms of economy and politics. Also examines the interconnections between organized criminals and legitimate organizations as well as analyzes legislative and policy responses.

CRIM 3100. Criminal Law. 4 Hours.
Discusses the definition of common crimes and criminal responsibility. Addresses moral, philosophical, constitutional, and public policy considerations in the use of criminal sanctions to regulate conduct. Requires the knowledge of particular criminal law concepts and the ability to identify them in complex fact patterns and discuss their implications and ramifications. Also requires the application of legal principles to fact situations in a logical way. Case briefing is required. Requires permission of instructor for freshman students.

CRIM 3200. Juvenile Justice. 4 Hours.
Introduces students to the history, structure, processes, and philosophies of juvenile justice systems in the United States. Responses to juvenile offenders-ranging from prevention and diversion to institutional corrections and aftercare—are explored in the context of youth policy generally. Focuses on contemporary issues and controversies (system fragmentation, changing conceptions of juvenile offenders, lack of a coherent justice system rationale, racial and gender bias in processing and confinement, and proposals to abolish the juvenile court).
CRIM 3300. Corrections. 4 Hours.
Examines the concept of punishment and its form, function(s), and enforcement throughout history, with an emphasis on current sentencing policies and procedures and their impact on the corrections system and correctional overcrowding. Explores the operation, structure, clientele, and issues confronting the institutions, agencies, and programs encompassing the corrections system including jails, prisons, and community-based corrections.

CRIM 3400. Security. 4 Hours.
Examines the history and evolution of security from a focus on crime prevention to one of loss prevention for business, industry, institutions, and government. Emphasizes the need for analytical, interpersonal, and communications skills in developing cost-effective programs for the protection of assets, personnel, and third parties. Discusses the security/government relationship.

CRIM 3500. Policing. 4 Hours.
Traces the history, evolution, and organization of the police in the United States. Examines the role of police in society, structure and culture of police organizations, function and activities of the police, and police deviance and accountability. The course objectives are to acquaint students with prior research on the police, examine critically the police as a component of the criminal justice system, explore the complex nature of the profession, and assist those who are considering a policing career to understand the realities of the job.

CRIM 3540. Services and Treatments for Chemical Dependencies. 4 Hours.
Explores students’ personal and cultural perspectives about substance use, abuse, and addiction through the use of readings, films, and case studies. Students evaluate the causes of chemical dependence, and methods of recognition, intervention, and treatment. Offers students the opportunity to investigate the effects of chemical dependency on the family. CRIM 3540 and HUSV 3540 are cross-listed.

CRIM 3600. Criminal Justice Research Methods. 4 Hours.
Introduces the basic concepts involved in conducting research in the areas of the criminal justice system and criminology. Through lectures, group discussions, and readings, familiarizes students with the scientific methods that are necessary for systematic analysis of crime trends, offender behavior, program effectiveness, and public attitudes about crime and justice. In so doing, students become capable of developing an idea, investigating and critiquing how it has been researched, developing a research design, and administering its implementation.

CRIM 3700. Criminal Justice Statistics. 4 Hours.
Offers a basic foundation in statistical methods with an emphasis on applications in criminal justice. Begins with basic descriptive techniques, including tabular and graphical displays of data as well as summary statistics. Next, the course covers significance tests of the difference between sample means or proportions and of the association among variables. Finally, assignments involve analyzing criminal justice data using statistical software.

CRIM 3900. Topics in Criminal Justice and Criminology. 1-4 Hours.
Focuses on topics related to criminal justice to be selected by instructor. May be repeated without limit.

CRIM 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CRIM 4000. Co-op Integration Seminar 3. 1 Hour.
Continues CRIM 3000. Builds upon what students learned in CRIM 3600 and focuses on experiences and research journals from the second co-op. Students discuss their research activities and findings, and begin to do some critical thinking about the nature of organizations. The discussion in this seminar also prepares them for the third co-op experience, in which they keep journals on some other aspect of organizational culture or dynamics. The seminar is pass/fail.

CRIM 4010. Gender, Crime, and Justice. 4 Hours.
Examines the topics of femininities and masculinities and their influence on participants in the criminal justice system. Also explores topics such as gender and criminological theory; the notion of gender and offending; women and men as victims of violence; and women and men as professionals within the criminal justice system. CRIM 4010 and WMNS 4010 are cross-listed.

CRIM 4020. Race, Crime, and Justice. 4 Hours.
Provides students with an overview of the role and treatment of racial/ethnic minorities in the criminal justice system. Covers historical and theoretical frameworks for understanding the relationship between race, crime, and criminal justice. In so doing, students become familiar with trends and patterns in criminal offending by racial/ethnic minorities, as well as system response to such behavior. Students who do not meet course prerequisites may seek permission of instructor.

CRIM 4030. Criminal Justice Organization and Management. 4 Hours.
Provides students with an overview of issues related to criminal justice organization and management. Covers the manner in which criminal justice agencies deal with crime and criminological issues, as well as how such agencies are organized and managed to find ways to deal with the crime problem. Students become familiar with the operations of criminal justice organization and management, and how individuals navigate and work with criminal justice agencies to deal with crimes. Students who do not meet course prerequisites may seek permission of instructor.

CRIM 4040. Crime Prevention. 4 Hours.
Offers an overview of issues related to crime prevention, both from criminological and criminal justice points of view. Examines crime prevention programs that encompass both the individual and community levels, as well as the integration of such levels. Offers students an opportunity to learn current theories of and leading research on the main approaches to preventing crime, including developmental, situational, and community prevention. Focuses on assessing effectiveness of prevention programs and policies.

CRIM 4100. Juvenile Law. 4 Hours.
Introduces the way society responds to juvenile offenders. Topics may include important legislation, fundamental case law, behavioral research studies, philosophy, history, delinquency, abuse and neglect, transfers and waivers, status offenses, and comparative law. Students may be required to observe actual juvenile cases in the Massachusetts Juvenile Court.

CRIM 4110. Legal Philosophy. 4 Hours.
Explores the great legal philosophers with emphasis on nineteenth- and twentieth-century philosophers and their contributions to legal philosophy in the United States. Examines in depth the development of American legal philosophy and its role in the administration of American justice.
CRIM 4120. Courts and Sentencing. 4 Hours.
Examines the role of criminal courts in the United States, the structure and organization of the court system, and the flow of cases from arrest to conviction. Focuses on the key actors in the courtroom—prosecutors, defense attorneys, judges, and court clerks—and the decision-making processes in charging a person with a crime, setting bail, pleading guilty, going to trial, and sentencing. Addresses prospects for reforming courts.

CRIM 4300. Community-Based Corrections. 4 Hours.
Provides an in-depth understanding of the variety of correctional options for law violators that are available within the community. Through lectures, group discussions, presentations, and reading of empirical research, students become knowledgeable about all forms of corrections and correctional facilities outside of jails and prisons, from traditional incarceration programs to the most current programs such as electronic monitoring, house arrest, day treatments, boot camps, and fines. Also discusses the philosophy and effectiveness of different types of community-based corrections while keeping in perspective the impact they have on each component of the criminal justice system.

CRIM 4310. Correctional Intervention. 4 Hours.
Examines the foundations of correctional interventions including overviews of the major systems of therapeutic intervention, diagnosis of mental illness, and correctional assessment and classification. Explores both theoretical and practical knowledge of the methods, strategies, and effectiveness of treating special populations such as sex offenders and substance abusers. Studies special topics such as problems of matching therapists and therapy methods to personality and setting, difficulties in the control and treatment of nonamenable and dangerous offenders, and the short-term reeducational and treatment methods uniquely suited to institutional settings.

CRIM 4400. Security Management, Supervision. 4 Hours.
Covers the duties and responsibilities of security managers and supervisors with special attention paid to planning, organizing, budgeting, staffing, directing, innovating, and overseeing the implementation of cost-effective loss-prevention programs. Examines the manager's role in security's professionalization and related issues.

CRIM 4500. Police Strategy. 4 Hours.
Examines current strategies utilized by U.S. police. Topics include the demand for police service, service delivery, missions and goals, resources and tactics, accountability, ethics, and operational effectiveness measurements. Emphasis is on successfully accomplishing the police mission in a responsible manner and within the many constraints under which officers and departments must operate. Focuses on in-class small-group work centered on a variety of scenarios in which students are charged with creating reasonable, legal, ethical, and effective solutions. A variety of learning formats are applied including written examinations, in-class group projects, a term paper, and written assignments.

CRIM 4610. Youth Gangs. 4 Hours.
Provides students with a theoretical and practical understanding of contemporary youth gangs in the United States. Covers problems in defining gangs; the nature and extent of gangs in the United States; explanations of gang formation and proliferation; variations in gang structure, function, and activities; the relationship(s) between gangs, drugs, and violence; gender, ethnic/racial, and community distinctions in gangs; and policies and programs addressing gangs (including law enforcement and prevention/intervention efforts).

CRIM 4630. Political Crime and Terrorism. 4 Hours.
Provides students an understanding of what political crime and terrorism is, the nature and extent of the problem historically and currently, as well as prevention efforts designed to combat political crime and terrorism. Students are exposed to several sources of information on political crime and terrorism including the news media, scholarly sources, and video accounts.

CRIM 4640. Corporate and White-Collar Crime. 4 Hours.
Introduces students to a variety of topics and issues in the areas of white-collar and corporate crime. Examines corporate and white-collar offending through the criminal justice and regulatory justice systems, beginning with detection and prosecution through adjudication and sentencing. A variety of special topics are also covered such as definitional issues, the nature and extent of white-collar crimes, measurement, crime types, case studies, and the etiology of offending.

CRIM 4660. Communities and Crime. 4 Hours.
Provides students with an overview of issues related to communities and crime. Examines sociological aspects of community context, behavior, and functioning, and how communities are implicated in both crime-generating and crime-preventing processes. Familiarizes students with historical and contemporary literature surrounding the communities and crime relationship, as well as how the study of human behavior generally, and crime particularly, should examine the interaction of persons and places.

CRIM 4710. Law and Psychology. 4 Hours.
Examines a broad array of topics, from criminal profiling to an examination of the nature of justice and its relationship to social control. Focuses on five major questions: what forensic psychologists do; how psychologists and lawyers look at the world; how the criminal justice system (police, courts, and corrections) and other institutions involved in social control use psychologists; what psychologists think about the criminal justice system and other institutions of social control; and how psychological (and other behavioral science) research can be used to help prevent crime. Because psychologists and lawyers see the world very differently, the course can help facilitate communication and understanding among present and future practitioners in each field, as well as in criminal justice and delinquency prevention generally.

CRIM 4720. Crime and the Life Course. 4 Hours.
Introduces students to life-course criminology—the study of individual lives and their experiences of crime. Key topics include understanding how people become involved in crime, why some people commit crime throughout their lives, and how and why others leave it behind. Considers what it means to adopt a life-course perspective and how that perspective differs from other ways of thinking about individuals and crime.

CRIM 4800. Crime Mapping. 4 Hours.
Designed as a practical and hands-on introduction to various GIS techniques. Offers students an opportunity to obtain an understanding of how geographic information systems (GIS) are used by law enforcement agencies. Covers tools that provide a more complete understanding of crime locations and explores how criminological theory and geographic information together can be used to develop crime prevention/reduction strategies. Focuses on the strengths and limitations of various criminological perspectives, how they may be used to inform enforcement decisions, and how to use GIS applications to create maps that convey a clear message regarding the spatial distribution of a given criminal behavior.

CRIM 4900. Advanced Seminar in Criminology and Criminal Justice. 4 Hours.
Focuses on specialized advanced topic in criminal justice to be selected by instructor. May be repeated without limit.
CRIM 4949. Senior Capstone Seminar. 4 Hours. 
Emphasizes study of organizations and organizational change, with focus on the organizations that comprise the criminal justice system and the environmental contexts in which they operate. Various theories of the structure and processes of organizations and the behavior of groups and individuals within organizations are examined to familiarize students with the different perspectives from which organizations can be studied (the bureaucratic model, the “principles of management” orientation, the human-relations approach, the human-resources approach, and systems theory). Also focuses on understanding change within organizations including a study of principles of organizational change and various approaches to planned change.

CRIM 4970. Junior/Senior Honors Project 1. 4 Hours. 
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

CRIM 4971. Junior/Senior Honors Project 2. 4 Hours. 
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

CRIM 4990. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CRIM 4991. Research. 4 Hours. 
Offers an opportunity to conduct research under faculty supervision.

CRIM 4992. Directed Study. 1-4 Hours. 
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CRIM 4993. Independent Study. 1-4 Hours. 
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CRIM 4994. Internship. 4 Hours. 
Offers students an opportunity for internship work. May be repeated without limit.

CRIM 4996. Experiential Education Directed Study. 4 Hours. 
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using the course to fulfill their experiential education requirement. May be repeated without limit.

CRIM 5900. Topics in Criminal Justice and Criminology. 3 Hours. 
Offers an intensive study of a topic related to criminal justice selected by the instructor. May be repeated up to four times.

CRIM 6962. Elective. 1-4 Hours. 
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CRIM 6964. Co-op Work Experience. 0 Hours. 
Provides eligible students with an opportunity for work experience. May be repeated without limit.

CRIM 6966. Practicum. 1-4 Hours. 
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

CRIM 7000. Qualifying Exam. 0 Hours. 
Provides eligible students with an opportunity to take the master’s qualifying exam.

CRIM 7200. Criminology. 3 Hours. 
Provides an overview of the current understanding of the causes of crime from an interdisciplinary perspective. Focuses on the major theories of crime and causation developed over the past two hundred years. Emphasis is on integrating criminological theory and research, assessing the implications of this knowledge base for policies relating to crime control and prevention. Also presents and discusses the most current data regarding the nature and extent of crime in the United States.

CRIM 7201. Global Criminology. 3 Hours. 
Examines how the processes of globalization influence crime and criminal justice around the globe. Analyzes globalization and recent developments in global crime, including global trends in policing and security. Explores the global applicability of dominant criminological theories and transferability of crime control policies. Offers students an opportunity to develop an understanding of international criminal justice, particularly as it pertains to war crimes, crimes against humanity, and the global protection of human rights.

CRIM 7202. The Criminal Justice Process. 3 Hours. 
Introduces students to the operation of the criminal justice system. Covers the components of the system, the process by which defendants are moved through that system, and key issues in the administration of criminal justice.

CRIM 7208. Law and Society. 3 Hours. 
Focuses on the sociology of law; emphasis is also on jurisprudential thought and the political analysis of legal institutions. Explores the sources of law and functions and dysfunctions of law in action. Reviews institutional roles of courts, legislatures, and administrative agencies. Topics include alternative dispute resolution, how the law can help or impede social change, whether Americans have become too litigious, or race and gender issues in achieving justice.

CRIM 7210. Gender, Crime, and Justice. 3 Hours. 
Examines ways in which criminology, the criminal justice system, and the law contribute to the social construction of gender. Investigates process through which biological females are encouraged to become girls and women by cultural assumptions about female deviance, discourses on female crime, the criminal justice system, and legal assumptions about the meaning of equality. Focuses on feminist approaches to criminal justice that parallel the new feminist jurisprudence.

CRIM 7212. Juvenile Justice. 3 Hours. 
Analyzes critically the policies and practices of the agencies involved in the processing of young persons through the juvenile justice system. Emphasis is on jurisdictional issues, police practices, detention, intake, diversion, adjudication, and dispositions of juveniles within the justice system. Also focuses on the historical development of the juvenile justice system as well as assesses current trends and proposals for reform. Emphasis is on the key policy issues facing juveniles involved with the juvenile justice system today.

CRIM 7214. Corrections Theory and Practice. 3 Hours. 
Reviews the history of our correctional system, said by many to have four central themes (revenge, restraint, reformation, and rehabilitation/reintegration). Defines the role and working relationship of corrections in the greater spectrum of criminal justice, identifies and discusses the issues and problems facing the system today, and evaluates its intended purpose vs. how it actually functions. Explores prison operations, from designing and staffing a prison to responsible reintegration. Discussions regarding the political, social, and economic issues that have impacted correction operations, such as sentencing reform, overcrowding, boot camps, and so on, are taken from the classroom to actual prison settings. Provides an overview of corrections through a blend of theory, practice, and firsthand observations.
CRIM 7224. Law and Psychology. 3 Hours.
Offers a seminar on conceptual, empirical, historical, and professional aspects of selected topics in forensic psychology including such areas as law and psychology, competence to stand trial, criminal responsibility, and the insanity defense. Topics include jury selection, reliability and validity of eyewitness testimony, truth detection methods, and postconviction pleadings.

CRIM 7228. Criminal Violence. 3 Hours.
Investigates and analyzes aggression and violence as forms of individual, group, and societal behavior. Includes an assessment of anthropological, biological, philosophical, political, and sociological theories. Combines student presentations and projects with lectures and tutorials.

CRIM 7230. Police and Society. 3 Hours.
Introduces research, theory, and applications of the causes and consequences of police behavior. Discusses a historical review of the role that police have played in society as well as the structure of large and small police organizations. Topics include community policing, problem-solving methods, police discretion, police misconduct, police crime prevention strategies, and restorative justice.

CRIM 7232. Juvenile Law. 3 Hours.
Examines the legal relationship between the juvenile offender and the state. Covers case and statutory law as well as constitutional due process standards in juvenile proceedings. Topics include jurisdiction, prejudicial process, waiver of jurisdiction adjudication, disposition and postdispositional issues, as well as the right to treatment.

CRIM 7234. Criminal Justice Organization and Management. 3 Hours.
Analyzes the structures, functions, and operations of criminal justice agencies including the police, the court, and corrections (jail, probation, prison, and parole) within the context of the entire criminal justice system. Reviews existing organizational theory and examines the application of these theories within agencies of criminal justice. Discusses interjurisdictional and intrajurisdictional issues facing these organizations and ethical dilemmas facing various decision makers.

CRIM 7240. Race and the Criminal Justice System. 3 Hours.
Offers a sociohistorical analysis of the effects of race and ethnicity on legitimate social opportunities, criminal behavior, victimization, and differential judicial processing. Analyzes the impact of assimilation and acculturation on criminal behavior, victimization, and criminal justice processes. Discusses issues resulting from increasing diversity of both the criminal justice workforce and society in general.

CRIM 7242. Terrorism and International Crime. 3 Hours.
Provides an overview of the various approaches to terrorism employed around the world. Discusses the theories of terrorism as well as the major international and national approaches to reducing terrorist threats. Also discusses the role of the news media, the political consequences of terrorism, the military as a resource, and the role of hostages.

CRIM 7244. Criminal Law and Procedure. 3 Hours.
Discusses the fundamental principles, concepts, and development of criminal law and the constitutional provisions that govern it. Focuses on the relationship of the individual to the state and includes an examination of the general framework of criminal law as a means of social control.

CRIM 7246. Security Management. 3 Hours.
Examines security theories, operations, and practices, emphasizing the administration and management of security. Explores the philosophical background, history, and current role of security as well as the role and status of the security manager in threat assessment, risk prevention, and the protection of assets. Discusses functional-area security systems; law, science, and technology for security; ad issues; and standards, goals, and challenges for the future. Explores security systems, particularly as they relate to criminal justice and the environment.

CRIM 7250. Victimology. 3 Hours.
Involves a scientific study of crime victims and public policy responses to them. Focuses on the nature and extent of criminal victimization, the dynamics of victim-offender relationships (e.g., incest and domestic violence), theories of victimization, a historical analysis of the victim’s role in the criminal justice process, the restorative justice model, and the contemporary victim rights and victim services movement.

CRIM 7252. White-Collar Crime. 3 Hours.
Introduces the concept of white-collar crime as an area of scientific inquiry and theory formation. Uses multiple perspectives and reference points to critically examine the latest scholarship on the subject, ranging from focus on the offense, offender, legal structure, organizational structure, individual and organizational behavior, to victimization and guardianship, with special attention on the interaction between these components. Assesses the nature, extent, and consequences of white-collar crime from a national and international perspective. Also focuses on the criminal justice system’s current efforts at controlling white-collar crime and, given the relative ineffectiveness of traditional criminal justice responses, alternative systems of control. Offers many tangible research-based suggestions regarding actions that organizations and businesses can take to reduce the significant losses accrued to white-collar crime.

CRIM 7254. Courts and Sentencing. 3 Hours.
Designed to provide students with a solid foundational knowledge base in the area of courts and sentencing within a reading- and writing-intensive seminar format. Offers students an opportunity to develop an understanding of the purpose, nature, and structure of courts and their role in the creation and maintenance of law (both domestic and international). Emphasizes the nature and impact of sentencing policy shifts. Also discusses the role of the U.S. Supreme Court and its decisions. Offers students an opportunity to understand the nature and purpose of law; the role of courts in society; the structure of courts and various court processes; the nature and purpose of sentencing; sentencing structure, process, and policy shifts; and appellate court review of sentencing practices.

CRIM 7258. Comparative Criminology. 3 Hours.
CRIM 7252. White-Collar Crime. 3 Hours.
Introduces the concept of white-collar crime as an area of scientific inquiry and theory formation. Uses multiple perspectives and reference points to critically examine the latest scholarship on the subject, ranging from focus on the offense, offender, legal structure, organizational structure, individual and organizational behavior, to victimization and guardianship, with special attention on the interaction between these components. Assesses the nature, extent, and consequences of white-collar crime from a national and international perspective. Also focuses on the criminal justice system’s current efforts at controlling white-collar crime and, given the relative ineffectiveness of traditional criminal justice responses, alternative systems of control. Offers many tangible research-based suggestions regarding actions that organizations and businesses can take to reduce the significant losses accrued to white-collar crime.

CRIM 7252. White-Collar Crime. 3 Hours.
Introduces the concept of white-collar crime as an area of scientific inquiry and theory formation. Uses multiple perspectives and reference points to critically examine the latest scholarship on the subject, ranging from focus on the offense, offender, legal structure, organizational structure, individual and organizational behavior, to victimization and guardianship, with special attention on the interaction between these components. Assesses the nature, extent, and consequences of white-collar crime from a national and international perspective. Also focuses on the criminal justice system’s current efforts at controlling white-collar crime and, given the relative ineffectiveness of traditional criminal justice responses, alternative systems of control. Offers many tangible research-based suggestions regarding actions that organizations and businesses can take to reduce the significant losses accrued to white-collar crime.

CRIM 7250. Victimology. 3 Hours.
Involves a scientific study of crime victims and public policy responses to them. Focuses on the nature and extent of criminal victimization, the dynamics of victim-offender relationships (e.g., incest and domestic violence), theories of victimization, a historical analysis of the victim’s role in the criminal justice process, the restorative justice model, and the contemporary victim rights and victim services movement.

CRIM 7255. Evidence-Based Crime Policy. 3 Hours.
Introduces students to the evidence-based paradigm in crime policy. Presents the theory and methods of the evidence-based paradigm, which places systematic research at the center of the policymaking process. Offers students an opportunity to further develop skills in critically assessing leading research findings and policy initiatives in the field of criminology and criminal justice.

CRIM 7262. Evidence-Based Crime Policy. 3 Hours.
Introduces students to the evidence-based paradigm in crime policy. Presents the theory and methods of the evidence-based paradigm, which places systematic research at the center of the policymaking process. Offers students an opportunity to further develop skills in critically assessing leading research findings and policy initiatives in the field of criminology and criminal justice.

CRIM 7264. Immigration and Crime. 3 Hours.
Introduces students to the study of crime and deviance with a specific emphasis on immigrant populations and/or Latino communities in the United States. Offers students an opportunity to develop an understanding of the historical relationship between patterns of immigration and patterns of crime, to examine the nature and extent of contemporary immigrant crime and victimization, and to assess the social and health consequences associated with crime among Latino and immigrant populations and within immigrant communities.
CRIM 7266. Crimes Against Humanity. 3 Hours.
Examines crimes against humanity with a specific focus on the role that criminology might play in helping us to understand the causes and consequences. Offers students an opportunity to critically assess the ways in which contemporary criminological theories fail to explain or address the most odious of all crimes—genocide, war crimes, and other crimes against humanity. Introduces students to the development of international criminal law and international criminal tribunals. Examines the International Criminal Court and its role in prosecuting perpetrators and holding individuals and heads of state accountable.

CRIM 7268. Human Trafficking. 3 Hours.
Provides an overview of the phenomenon of human trafficking as defined in the U.N. Protocol and the U.S. Victims of Trafficking Violence Prevention Act. Emphasizes understanding the experiences and needs of trafficking victims and the methods of operations of traffickers and their networks. Examines various forms of human trafficking victimization, including sex trafficking, forced labor, bonded labor, domestic servitude, and chattel slavery in both the United States and international contexts. Explores the roles of the state, media, culture, and criminal networks in both creating the conditions under which human trafficking exist and eradicating the problem of trafficking.

CRIM 7270. Crime and Community Context. 3 Hours.
Provides an overview of crime in the context of communities. Covers major theoretical perspectives and introduces students to both major quantitative and ethnographic work on communities. Examines sociological aspects of community context and contrasts aspects of community processes that are implicated in either the generation or the prevention of crime. Considers current criminal justice practices and crime prevention approaches intended to address crime within communities—especially as they interact with neighborhood social processes in ways that deter or facilitate community crime.

CRIM 7308. Seminar in Policing. 3 Hours.
Examines the police function from a multitude of perspectives. Moves beyond analysis of the institution of the public police to explore the broader meaning and role of policing in modern societies. Emphasizes changes in the organization, structure, strategies, and control of policing. Students are expected to critically analyze existing empirical research that sheds light on the effectiveness of the police.

CRIM 7312. Special Topics in Criminology and Public Policy. 3 Hours.
Focuses on a particular aspect of criminology and/or public policy of contemporary interest. This course rotates annually. May be repeated without limit.

CRIM 7314. Special Topics in Law and Justice. 3 Hours.
Focuses on a particular aspect of law and justice of contemporary interest. This course rotates annually. May be repeated without limit.

CRIM 7316. Advanced Topics in Methods. 3 Hours.
Focuses on particular application methods not covered extensively in other research methods courses. This course rotates annually. May be repeated without limit.

CRIM 7317. Qualitative Methods. 3 Hours.
Introduces the principles and use of common qualitative methods in social science research with a particular focus on their application in the field of criminology and criminal justice. Offers students an opportunity to engage in primary data collection and to learn how to use a variety of analytic techniques including transcription, field note preparation, memos, development of coding schemes and conceptual frameworks, and data-verifying techniques.

CRIM 7325. Advanced Seminar in Policing. 3 Hours.
Examines crimes against humanity with a specific focus on the role that criminology might play in helping us to understand the causes and consequences. Offers students an opportunity to critically assess the ways in which contemporary criminological theories fail to explain or address the most odious of all crimes—genocide, war crimes, and other crimes against humanity. Introduces students to the development of international criminal law and international criminal tribunals. Examines the International Criminal Court and its role in prosecuting perpetrators and holding individuals and heads of state accountable.

CRIM 7326. Crimes Against Humanity. 3 Hours.
Examines crimes against humanity with a specific focus on the role that criminology might play in helping us to understand the causes and consequences. Offers students an opportunity to critically assess the ways in which contemporary criminological theories fail to explain or address the most odious of all crimes—genocide, war crimes, and other crimes against humanity. Introduces students to the development of international criminal law and international criminal tribunals. Examines the International Criminal Court and its role in prosecuting perpetrators and holding individuals and heads of state accountable.

CRIM 7332. International Law and Justice. 3 Hours.
Introduces students to the development of international criminal law and how the international community seeks justice. Focuses on misconduct that concerns more than one state and can only be prevented, suppressed, and sanctioned through international cooperation. Examines problems arising out of the existence of many legal systems and jurisdictions, conflicts of legal traditions, norms or interpretations of international rules. Covers sources of international criminal law, as well as types of international crime, such as aggression, war crimes, genocide, crimes against humanity, crimes against the environment, theft of cultural property, etc. Examines international cooperation issues (extradition, mutual legal assistance, return of corruption-derived assets), the role of Interpol and Europol, as well as other standard-setting organizations; the International Criminal Court; and ad hoc tribunals.

CRIM 7334. Transnational Crime. 3 Hours.
Examines how globalization and internationalization affect crime and crime control in the United States (e.g., human trafficking) and the emerging field of “global criminology”, including the analysis of international and regional trends and differences in law, crime, and justice. Because of the globalization of economic markets, knowledge, information, and transportation, crime and crime control are changing in extent and nature. Global developments often directly affect and shape local crime problems and crime policies (“glocalization”).

CRIM 7338. Special Topics in Globalization and International Crime. 3 Hours.
Focuses on a particular aspect of globalization and international crime of contemporary interest. This course rotates biannually. May be repeated without limit.
CRIM 7340. Special Topics in Criminal Justice Organizations and Leadership. 3 Hours.
Focuses on a particular aspect of criminal justice organizations of contemporary interest. This course rotates biannually. May be repeated without limit.

CRIM 7400. Graduate Criminal Justice Capstone. 3 Hours.
Seeks to help students integrate knowledge of criminological theory and justice policy with the research skills gained while working toward completion of the graduate degree. Offers students an opportunity to demonstrate their mastery of knowledge in the field of criminology and criminal justice and synthesize this knowledge with practical skills. Successful completion of this course requires submission of a comprehensive research paper on a specific subject, as agreed upon by the instructor.

CRIM 7404. Research Methods and Statistics. 3 Hours.
Offers an integrated introduction to research methods and statistics in the social and behavioral sciences. Illustrates how the basic methods of research design, measurement, and data collection bear directly on how those data can be analyzed empirically. Offers students an opportunity to develop a methodological and statistical toolbox that can be used to read, understand, carry out, and critically analyze scientific research.

CRIM 7500. Internship 1. 3 Hours.
Offers field placement in a criminal justice agency involving administrative, research, teaching, and related activities. Provides students with the opportunity to apply theoretical concepts in a practical, applied fashion by observing and contributing to the daily activities of operating agencies and organizations. All students work on at least one specific project at their field placement, and the results of this project are submitted to the graduate director.

CRIM 7502. Internship 2. 3 Hours.
Offers field placement in a criminal justice agency involving administrative, research, teaching, and related activities. Provides students with the opportunity to apply theoretical concepts in a practical, applied fashion by observing and contributing to the daily activities of operating agencies and organizations. All students work on at least one specific project at their field placement, and the results of this project are submitted to the graduate director.

CRIM 7700. Practicum in Teaching. 0 Hours.
Provides weekly meetings for graduate student lecturers and faculty advisers to discuss common concerns and issues arising during the course of teaching. With input from the Center for Effective University Teaching, covers topics such as syllabus preparation, examination preparation and grading, classroom protocol, and student interaction. Required for all doctoral students teaching a class for the first time.

CRIM 7702. Practicum in Policy Analysis. 1 Hour.
Offers graduate students the opportunity to work with an outside agency and meet weekly with a faculty adviser to discuss common concerns, problems, and ideas related to policy analysis.

CRIM 7704. Practicum in Research. 1 Hour.
Provides weekly meetings for graduate students and faculty advisers to discuss common concerns, problems, and ideas related to launching their dissertation research projects. Discusses such topics as data access and quality, measurement, and research ethics.

CRIM 7706. Practicum in Writing and Publishing. 2 Hours.
Offers students an opportunity to develop and improve their academic writing skills while preparing a sole-authored article for potential publication. Requires each student to present a paper in-progress and, through an iterative process of review and revision, have it ready to submit to a journal by the end of the semester. Students comment, orally and in writing, on the papers presented by the other students over the course of the semester. There are regular assignments from leading texts on mechanics and style in writing and reflections on the peer-review and publication processes from multiple perspectives. May be repeated once.

CRIM 7710. Criminology and Public Policy 1. 3 Hours.
Provides detailed coverage of theoretical criminology and its implications for public policy. Approaches the understanding of crime from an interdisciplinary perspective, with special attention given to recent theoretical developments. Emphasizes evaluating theory in light of empirical research, understanding the implications of theory and research for programs and policies of crime prevention and control, and evaluating current approaches to crime prevention and control.

CRIM 7711. Criminology and Public Policy 2. 3 Hours.
Continues CRIM 7710. Provides detailed coverage of theoretical criminology and its implications for public policy. Approaches the understanding of crime from an interdisciplinary perspective, with special attention given to recent theoretical developments. Emphasizes evaluating theory in light of empirical research, understanding the implications of theory and research for programs and policies of crime prevention and control, and evaluating current approaches to crime prevention and control.

CRIM 7713. Advanced Research and Evaluation Methods. 3 Hours.
Deals in detail with all aspects of evaluation research. Includes both process and outcomes evaluation models and a discussion of experimental and quasi-experimental designs. Students review both qualitative and quantitative approaches to evaluation design and discuss financial issues in program evaluation. Exposes students to methods to develop an evaluation research proposal.

CRIM 7715. Multivariate Analysis 1. 3 Hours.
Builds upon the concepts of correlation and inference to present analytic procedures involving several variables, including multiple regression, logistic regression, causal analysis, and multiway ANOVA. Emphasizes the application of these methods with criminal justice data sets using statistical software programs.

CRIM 7716. Multivariate Analysis 2. 3 Hours.
Continues CRIM 7715. Covers more advanced multivariate analytic methods. Topics include principal components and factor analysis, discriminant analysis, MANOVA, time series, and cluster analysis. Emphasizes the application of these methods with criminal justice data sets using statistical software programs.

CRIM 7718. Advanced Data Analysis. 3 Hours.
Designed to build upon the foundations provided by CRIM 7715 and CRIM 7716 with the goal of students becoming proficient with selected quantitative multivariate analysis techniques. Topics covered in this course include various general linear models, hierarchical linear models, and survival analysis. Requires substantial computer use as particular emphasis is placed on analyzing data using a variety of statistical programs. This is a PhD-level course.
CRIM 7720. Crime Mapping. 3 Hours.  
Studies the process of mapping. Employs a holistic approach to learning how to create and interpret maps, which seeks to provide a much deeper understanding of crime mapping and leave students with a solid foundation of skills that are transferable and scalable. Although this course represents an introduction to crime mapping, the goal is that students completing the course are successful in future mapping endeavors. Focuses on how to create effective maps (start to finish) rather than focusing largely on the various mapping capabilities currently available to researchers.

CRIM 7962. Elective. 1-4 Hours.  
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CRIM 7976. Directed Study. 1-4 Hours.  
Offers the student the opportunity to bring individual, concentrated attention to a particular topic as arranged and agreed upon in advance by a faculty member and the student. This option is generally recommended when the student desires a more intensive analysis of a particular subject. May be repeated without limit.

CRIM 7978. Independent Study. 1-4 Hours.  
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

CRIM 7990. Thesis. 6 Hours.  
Offers students electing to write a master’s thesis the opportunity to select a thesis topic with the advice of a faculty member and receive approval of the thesis topic from the graduate director. May be repeated without limit.

CRIM 7996. Thesis Continuation. 0 Hours.  
Continues thesis work conducted under the supervision of a departmental faculty.

CRIM 8960. Exam Preparation—Doctoral. 0 Hours.  
Offers the student the opportunity to prepare, under faculty supervision, for the PhD qualifying examination.

CRIM 8964. Co-op Work Experience. 0 Hours.  
Provides eligible students with an opportunity for work experience. May be repeated without limit.

CRIM 8966. Practicum. 1-4 Hours.  
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

CRIM 8982. Readings. 1-4 Hours.  
Offers selected readings under the supervision of a faculty member. May be repeated without limit.

CRIM 8984. Research. 1-4 Hours.  
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CRIM 8986. Research. 0 Hours.  
Offers an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

CRIM 9000. PhD Candidacy Achieved. 0 Hours.  
Indicates successful completion of the doctoral comprehensive exam.

CRIM 9984. Research. 1-4 Hours.  
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

CRIM 9986. Research. 0 Hours.  
Offers an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

CRIM 9990. Dissertation. 0 Hours.  
Provides the student with the opportunity, under close faculty guidance, to conduct an original investigation of a criminal justice issue. Each student identifies a faculty chair and two additional faculty members who comprise the student’s Dissertation Committee. While the student conducts research and develops a dissertation, the committee provides support and direction and, ultimately, approves the final research product. May be repeated without limit.

CRIM 9996. Dissertation Continuation. 0 Hours.  
Offers continued thesis work conducted under the supervision of a departmental faculty. May be repeated without limit.

CJS 0101. Emerging Leaders in Policing. 6 Hours.  
Features a blend of intensive classroom work and course-related assignments completed on the job, with the goal of providing students with the knowledge and skills they need to be effective police leaders. Offers students an opportunity to foster leadership competencies and confidence. Uses workshops to focus on four themes: understanding the social and political context of policing, how to lead effectively in that context, how to think and act strategically, and skills for success. Emphasizes an interim period back on the job to be used as a “leadership lab.” Requires a reading assignment and a short writing assignment to be completed and connected to the course work back in the classroom.

CJS 0109. The Chiefs’ Forum. 3 Hours.  
Designed to provide police executives a forum in which to explore, discuss, and more effectively address key leadership challenges they face. Through high-quality educational programming, our goal is to facilitate their development as visionary, ethical leaders with expanded capacity to deliver justice and safety. Seminar topics include leadership and the competing demands of post-9/11 policing, labor relations and executive decision making; the future of U.S. policing; policing the communities of our futures: changing demographics and the implications for police leadership and police strategy; the big picture of police technology: what to look for, what to look out for; and leading and managing Generations X and Y.

CJS 0500. Executive Certificate—Private Security. 4 Hours.  
Description unavailable.

CJS 0508. Crime Scene Investigation. 3 Hours.  
Covers certain basic considerations, guidelines, and procedures that help the crime scene technician avoid oversight, ensure thoroughness of search, and comply with both the legal and scientific pertaining to the use of physical evidence. Studies in detail the procedures for recording the crime scene—i.e., note taking, sketching, and photography—as well as the basic steps that minimize the omissions or contamination of evidence.

CJS 0516. Understanding the Department of Homeland Security. 3 Hours.  
Designed to introduce students to the newly established Department of Homeland Security. Examines issues such as interdepartmental workings, legal restrictions placed on the DHS mandate, how the DHS interacts with international agencies, and how effective the DHS has been since its inception.

CJS 5976. Directed Study. 1-4 Hours.  
Offers students an opportunity to carry out an individual reading and research project under the supervision of a faculty member. The directed study format allows for the in-depth analysis of a particular topic not covered in-depth or the study of a subject not typically covered in the curriculum. A directed study proposal must be approved by the faculty sponsor, division head, and dean of academic affairs.
CJS 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

CJS 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

CJS 6000. Management for Security Professionals. 3 Hours.
Offers security management professionals an opportunity to obtain the knowledge, skills, and context to be able to effectively communicate with managers in other functional areas. Understanding core business and management functionality, such as organizational behavior, financial processes, human resource management, marketing, and communications, is the cornerstone to effectively integrating security management industry-wide.

CJS 6005. Legal and Regulatory Issues for Security Management. 3 Hours.
Addresses regulatory issues relating to security management as well as the specifics of historical and ongoing litigation relating to charges of negligent security and negligent supervision.

CJS 6010. Advanced Principles of Security Management and Threat Assessment. 3 Hours.
Takes an advanced approach to management and administrative theory as it relates to private security operations and practices, with an emphasis on threat assessment in the post-9/11 environment. Focuses on the new responsibilities of security management professionals with regard to their response to terror and a changed threat environment.

CJS 6015. Crisis Management. 3 Hours.
Examines crisis management from the perspective of practitioners as well as academics. Crises are a fact of life in organizations. Natural and manmade disasters, sexual harassment charges, psychopathic acts, and product callbacks are a few situations that require intelligent management of both internal and external stakeholders. Studies cases of crisis and examines principles and theories that can be guides for management during crisis.

CJS 6020. Contemporary Issues in Criminal Justice Policy. 3 Hours.
Examines a broad range of problems faced by the criminal justice system in the twenty-first century. By examining issues such as community policing, racial profiling, police use of deadly force, national drug control policy, and sentencing guidelines, offers students an opportunity to recognize the impact of crime on society and the complexities of potential solutions to the crime problem.

CJS 6025. Genocide and War Crimes. 3 Hours.
Exposes students to specific cases of genocide and war crimes and surveys current international-level policies bearing on genocide and war crimes. Assesses responses of international organizations and national governments to such crimes to identify existing difficulties in developing appropriate methods of punishments and prevention of crimes against humanity.

CJS 6030. Organized Crime. 3 Hours.
Surveys the history of organized crime around the world. Introduces the origins and activities of organized crime groups, policies designed to combat organized crime, and explanations for the persistence of organized crime. Also discusses new forms of organized crime.

CJS 6035. Corruption, Integrity, and Accountability. 3 Hours.
Traces the history, nature, causes, and effects of corruption through concrete cases and illustrations. Emphasizes corruption in the justice system, politics, and public administration, as well as international cases. Also covers international and national laws and standards against corruption (with special emphasis on the U.N. convention against corruption and the Foreign Corrupt Practices Act). Following an in-depth discussion of efforts to measure corruption, governance, and anticorruption efforts, the course then focuses on the role of stakeholders, ranging from the private sector to government, civil society, and individual actors.

CJS 6040. Human Trafficking and Exploitation. 3 Hours.
Introduces the phenomenon of human trafficking in the global context. Discusses specific forms and regional variations of human trafficking, including forced labor and sex work. Examines individual and societal effects of human trafficking and assesses formal responses to this type of crime. Also covers the role of global processes in the facilitation of human trafficking.

CJS 6045. Policing Issues around the Globe. 3 Hours.
Surveys current global policing issues and explores the increasing opportunities for and benefits of cooperation between policing organization across national boundaries. Also examines modern policing by comparing police practices around the globe, identifying common challenges in policing across the world, and investigating the challenges faced by an increasingly "internationalized" form of policing.

CJS 6050. Models of Intelligence-Led Policing. 3 Hours.
Examines the historical evolution of intelligence-led policing (ILP) concepts and the different models of implementation that have developed around the world. Analyzes and compares ILP models in use in the United Kingdom, Australia, New Zealand, Canada, and the United States.

CJS 6055. The Intelligence Cycle: Applicability to U.S. Law Enforcement. 3 Hours.
Examines the applicability of the traditional intelligence-cycle methodology used by the CIA and other intelligence agencies to state and local law enforcement operations and organizational culture. Topics include the definitions of intelligence in the law-enforcement context; the process for turning raw information into intelligence; the intelligence requirements process; information-sharing protocols in the post-9/11 era; the roles of collectors, analysts, and decision makers; privacy and information security; and intelligence information and the evidentiary process. Examines the establishment and operation of “fusion centers” and the roles played by non-law-enforcement agencies, the private sector, and the public as sources and potential consumers of information.

CJS 6060. Intelligence-Led Policing: Legal and Regulatory Issues. 3 Hours.
Examines pertinent federal and state laws and regulations with implications for intelligence-led policing (ILP) and the legal and practical issues of information sharing at the federal, state, and local levels of government. Explores the differences between intelligence information and criminal case-related information, as well as issues of privacy, civil rights, and public perception. Emphasizes the nuances of homeland security and national security information.

CJS 6100. Introduction to Service Industries Security. 3 Hours.
Introduces the organization and administration of programs designed to protect and conserve the assets of hospitality and healthcare industry facilities. Emphasizes security’s contribution in helping to prevent, or at the very least minimize, losses that can affect the quality of service and care afforded to guests and patients, respectively, in these two service industries.
CJS 6105. Domestic and International Terrorism. 3 Hours.
Includes a general introduction to the overt as well as underlying ideology, history, reasons, and causes of terrorism. Discusses both domestic and international terrorism, with a focus on domestic hate groups, the roles of politics and the media, and counterterrorism. Exposes students to the philosophies of terrorists and terrorism.

CJS 6110. Management of Service Industries Security Department. 3 Hours.
Considers the organization, staffing, training, and supervision of hospitality and healthcare industry security departments and the management of their financial, human, and physical resources in order to provide optimum protection for minimum expense. Examines the responsibilities of security personnel, the authority needed for their discharge, and the legal issues that relate to security department operations.

CJS 6120. Preventing Service Industries Losses. 3 Hours.
Studies the integration of hospitality and healthcare industry security into the total workplace environment in order to prevent losses these two types of industries are particularly susceptible to. Topics include prevention of losses wherever possible and minimizing the dollar value of losses that might be inevitable. Emphasizes purchasing, food and beverage operations, housekeeping, engineering, and laundry operations, in both cases, and on pharmacy operations in medical centers and nursing homes.

CJS 6125. Issues in National Security. 3 Hours.
Examines the changes in U.S. policy fostered by the terrorist attacks of September 11, 2001. Studies the organizations and resources developed since that time to defend national security. Also examines the role played by all the components of the criminal justice system, as well as the policies and practices that they have developed, in providing for the security of the nation. Emphasizes the adjudication process as it relates to issues of national security and the correctional practices employed to maintain national security.

CJS 6130. Computer Security for Service Industries. 3 Hours.
Studies the need to protect computers, and the data generated by and stored within, dealing with guest and patient registration, records, departures and discharges, financial transactions, as well as data pertaining to a hotel’s or medical center’s operations and business activities. Also covers information regarding patient medications and treatment within the healthcare industry.

CJS 6135. Intimate Partner Violence. 3 Hours.
Examines the causes and consequences of intimate partner violence, as well as the latest research regarding the criminal justice response.

CJS 6140. Security Role: Safety and Environment Protection. 3 Hours.
Studies how the security function can promote and assist the development and implementation of effective safety and environmental protection programs that contribute to guest comfort, patient care, and profits. Covers minimizing the risk of violent acts in both settings and of harm to medical center personnel caused by careless storage or disposition of contaminated or hazardous items. Topics include the legal issues that can arise, the penalties that can be assessed as a result of noncompliance, and the impact that this can have on reputation.

CJS 6145. Correctional Rehabilitation. 3 Hours.
Examines theories, techniques, and policies of correctional treatment from applied, planning, and evaluation perspectives. Focuses on the classification of offenders, how criminological theory informs rehabilitation programming, and the principles of effective correctional intervention. A primary purpose of this course is to inform students using the existing research on what “works” and “doesn’t work” in the treatment of offenders.

CJS 6150. Interpersonal Relationships in the Service Industry. 3 Hours.
Examines the importance of security managers and personnel who work in the hotel and healthcare industries being able to develop and maintain good relationships with their co-workers and, more importantly, to be able to relate to and understand the needs of hotel guests and concerns of hospital patients, their families, and friends, without reducing their effectiveness in protecting and conserving employers’ assets.

CJS 6200. Institutional Development, Change, and Leadership. 3 Hours.
Focuses on institutional change and development issues that have evolved in policing, including shifts in the paradigm of policing, the need for institutional and ethical leadership, concerns with understanding and managing environmental uncertainty and institutional risk, and preparing police agencies for continuous improvement. Considers models of change and institutional/leadership responses to change.

CJS 6205. Law Enforcement Management and Planning. 3 Hours.
Addresses a range of criminal justice management issues, including organizational structure, purpose, rewards and relationships, leadership and management styles, and the development of effective change strategies by law enforcement agencies. Includes models of effective planning and information system development to enact “intelligence-led” policing.

CJS 6210. Law Enforcement Program Evaluation. 3 Hours.
Offers students an opportunity to learn to develop metrics for determining and reporting individual and institutional performance. Examines both quantitative and qualitative approaches of evaluation, with an emphasis on techniques for measuring both prevention and response initiatives and their outcomes.

CJS 6220. Legal and Governance Issues in Law Enforcement Agencies. 3 Hours.
Examines the specific laws under which public-sector agencies and law enforcement operate and considers their effect on the operations of public agencies, particularly those with law enforcement mandates. Offers students an opportunity to learn about general liability, regulatory compliance/reporting, and contracts. Focuses on the roles, responsibilities, processes, and relationship with oversight organizations.

CJS 6240. Human Resource Management in Law Enforcement Agencies. 3 Hours.
Examines methods of developing, supervising, motivating, and recognizing personnel; communicating effectively within an organization; as well as stress, conflict, and crisis management. Managers in law enforcement agencies face the challenge of managing both sworn and nonsworn personnel. Explores HRM topics such as collective bargaining, professionalism, motivation, training, productivity, and accountability.

CJS 6250. Financial Management in Law Enforcement Agencies. 3 Hours.
Introduces students to the major financial management concepts and techniques required for effective management of public-sector organizations. Managing one’s budget well is an essential skill for the law enforcement manager because the organization’s core mission cannot be served if the financial health of the agency is not in balance. Offers students an opportunity to learn about public-sector budget management, financial statements and reports, grant compliance, internal expenditure control, audits, cash flow management, and long-term financial planning.
CJS 6300. Communities and Crime. 3 Hours. 
Focuses on various issues in the study of communities and crime. Offers students an opportunity to understand how neighborhood organization and patterns affect crime and vice versa. Attention is given to both the factors that influence neighborhood-level crime rates, as well as the effects that neighborhood characteristics have on the behavior and outcomes of individuals. Includes policy implications and current practices.

CJS 6305. Criminal Behavior and the Family. 3 Hours. 
Studies theories and research concerning the socialization experience and its impact on behavior. Topics examined include, but are not limited to, child abuse and neglect, parental substance abuse, disciplinary techniques, and single-parent families.

CJS 6310. Partnering for Prevention and Community Safety. 3 Hours. 
Focuses on the history of community-law-enforcement relationships in both a pre- and post-9/11 environment. Covers the benefits and challenges of institutionalized law enforcement-community partnerships, particularly as they relate to prevention and response efforts. Focuses on promising practices for building such relationships.

CJS 6315. Administration of the Adult and Juvenile Correction Systems. 3 Hours. 
Examines the operation and nature of the U.S. correctional system, including the juvenile justice system as well as the adult correctional system. Covers theories and philosophies of correctional administration and the conditions that generate delinquent behavior as well as current critical issues such as overcrowding, alternatives to incarceration, and efforts to maintain family cohesion.

CJS 6320. Community Corrections. 3 Hours. 
Provides an overview of the correctional options for law violators that are available within the community, such as electronic monitoring, house arrest, day treatment centers, and boot camps. Addresses the effectiveness of different types of community-based corrections while focusing on the impact they have on each component of the community.

CJS 6325. Probation and Parole. 3 Hours. 
Examines the major developments in probation and parole including current best practices. Explores the rationale for and techniques used in supervising convicted offenders within communities. Considers issues associated with presentence investigation including caseloads, revocation hearings, community support services, and assessing current and future behavior of probationers and parolees. Analyzes the efficacy of community corrections and other forms of in-community social control.

CJS 6330. Youth Justice and Crime. 3 Hours. 
Examines the social conditions that generate delinquency and the legal practices intended to control it. Through the discussion of recent research, legislation, and policy documents, students are encouraged to consider the response of the criminal justice agencies to youth crime as well as assess the role of the family, the school, and the community in preventing and controlling juvenile delinquency.

CJS 6340. Substance Abuse and Addictions. 3 Hours. 
Provides the criminal justice professional with an overview of relevant issues surrounding the use/abuse of drugs and alcohol. Examines the relationship between substance abuse/addiction and crime. Explores the impact of drug legislation, i.e., school zone, three strikes, mandatory minimum sentences, etc., on police, the courts, and corrections. Investigates current programs and their effectiveness on prevention.

CJS 6400. Administration of Justice. 3 Hours. 
Explores the moral, ethical, and philosophical dimensions of what it means to practice, and to lead the practice of, justice. Examines the theoretical, ethical, and constitutional foundations and the social history of American criminal justice institutions. Analyzes the contradictions, controversies, major issues—such as race and justice—ideas, and events that have shaped policy and practice. Also explores the future of justice practice in America.

CJS 6405. Criminological Theory for Criminal Justice Leaders. 3 Hours. 
Examines a wide range of criminological theories pertaining to criminal offenders and the correlates of crime. Students are expected to read selections from the leading empirical and theoretical literature on crime and criminality, to involve themselves in group discussions of the reading, and to assess critically the applicability of various theoretical perspectives to selected crime types.

CJS 6410. Organizational Leadership Seminar. 3 Hours. 
Discusses organizational theory and practice and the key role played by a leader. Examines the application of these theories within criminal justice agencies. Discusses interjurisdictional and intrajurisdictional issues facing these organizations and ethical dilemmas facing decision makers.

CJS 6415. Legal Decision Making and Leadership. 3 Hours. 
Reviews the literature on decision making, especially in the criminal justice system, and utilizes case studies as a way to discuss how legal constraints can affect leadership. While legal procedures, rules, and guidelines must be observed, they are only one set of constraints on active leadership. Decision making in an organizational context requires knowledge of the organization’s operation, its culture, and the situations in which decisions are shaped and made individually or collectively.

CJS 6420. U.S. Policing in the 21st Century. 3 Hours. 
Explores the major substantive topics and criminal behavior trends now facing police leaders. Focuses on priority crime issues including street violence, gangs, guns, drugs, human trafficking, terrorism, and cyber crime. Examines current and emerging anticrime strategies such as community policing, intelligence-led policing, and multijurisdictional intelligence fusion operations. Analyzes emerging technology and its applicability to crime prevention and response.

CJS 6425. Research Methods. 3 Hours. 
Surveys the methods and techniques of research and evaluation and reviews various strategies for integrating the findings obtained into agency policy and strategy. Topics include surveying, observation, analysis of archival data, and experimentation. Introduces various evaluation designs. Covers issues such as ethical problems and the design, procedures, and politics of research. The goal of this course is not to produce social scientists but to prepare students to be critical consumers of social science research.

CJS 6430. Risk Management. 3 Hours. 
Provides a framework for an organizational leader to improve decision making through a comprehensive understanding of an organization’s exposure to risk. Exposes students to skills for conducting these assessments across organizational boundaries and in public-private partnerships. Focuses on how to model, measure, or assess undesirable risks and reduce risks relevant to large organizations with collective public obligations. Emphasizes conducting homeland-security-related assessments across criminal justice disciplines and in public-private security collaborations.
CJS 6435. Program Evaluations. 3 Hours.
Offers students an opportunity to understand the elements of successful program evaluation as well as the threats to validity implicit in program evaluation designs. Identifies the infrastructure, including information needed to implement new programs based on evaluations, and seeks to enable students to assess the utility of evaluations made of programs in their respective fields.

CJS 6440. GIS, Evidence-Based Learning, and Policy. 3 Hours.
Offers students an opportunity to develop an understanding of GIS-assisted mapping, other uses of GIS, as well as the misuse and misinterpretation that often occurs when maps are drawn based on inaccurate information. GIS applications are currently being deployed to gather information and intelligence across a broad spectrum in the public domain. Discusses the ethical and technical aspects of such data-driven approaches.

CJS 6455. Labor Relations. 1 Hour.
Examines the basics of labor-relations law and policy and how those basics play out in real-life, union-management relationships. Offers students an opportunity to learn theory as well as the latest information on legislative, administrative, and judicial actions as they impact collective bargaining and other aspects of the constantly changing landscape of labor relations in a unionized criminal justice setting.

CJS 6470. Criminal Justice Capstone. 3 Hours.
Forms the culmination of the student’s learning in the Criminal Justice Leadership Program. Serves to synthesize the knowledge gained from each course in the program. Offers students an opportunity to utilize this knowledge to improve their leadership abilities.

CJS 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

CJS 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CJS 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

CJS 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

CJS 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

CJS 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

CJS 6983. Topics. 1-4 Hours.
Covers special topics in criminal justice. May be repeated without limit.

CJS 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

---

Culture (CLTR)

CLTR 1000. Cultures, Societies, and Global Studies at Northeastern. 1 Hour.
Introduces first-year students in the College of Social Sciences and Humanities to the liberal arts in general. Seeks to familiarize them with their major, to help them develop the academic skills necessary to succeed (analytical ability and critical thinking), to provide grounding in the culture and values of the university community, to help them develop interpersonal skills, and to familiarize them with all skills needed to become a successful university student.

CLTR 1120. Introduction to Languages, Literature, and Culture. 4 Hours.
Examines the rich interconnections between literature and language and the culture that supports them. Discusses the relationship of language to literature and investigates how language and literatures are embedded in culture. Addresses several very broad and important questions, such as the relationship between language and culture; the relationship between language and thought; the definition of cultural relativism; and how ethical dilemmas are expressed in different cultures. Explores the relationship of esthetic and rhetorical traditions in given languages to the culture from which they sprang. In this context, examines the extremely interesting case of American Sign Language and how a gestural language sheds light on these issues.

CLTR 1140. Italian Society through Film. 4 Hours.
Explores the past three decades of Italian society through film using screenings, lectures, and discussions. Topics covered include the European immigration crisis; complex Italian politics; the modern-day Mafia; and Italian societal constructs, including gender norms, the family, and workplace dynamics. Examines the relationship of filmmaking and society. Explores positionality from multiple lenses. Seeks to foster student reflection and critical thinking through guided discussions and writing assignments and to broaden students’ awareness of Italian culture and society by considering social and ethical concerns presented in films. Students examine human nature and social behavior in the face of globalization and social change in contemporary Italian society. Includes the works of influential Italian filmmakers, such as Comencini, Virzì, Ozpetek, Muccino, and Moretti.

CLTR 1240. Latin American Film. 4 Hours.
Examines contemporary works of cinematography in Latin America, focusing on the culture and imagery of the Spanish-, French-, and Portuguese-speaking peoples of the Western hemisphere, including the United States. Critically engages—from a technical (cinematographic), genre, and sociohistorical perspective—topics of history, memory, and cultural resiliency; colonialism, racism, and patriarchy; dictatorship, revolution, and democratization; and nationalism, dependency, and globalization. Conducted in English; most films are in French, Portuguese, or Spanish with English subtitles.

CLTR 1250. Introduction to Japanese Traditional Culture. 4 Hours.
Covers Japanese culture from ancient times through the 1930s. Studies and analyzes Japanese cultural practices, history, and texts. Offers a critical understanding and interpretation of the culture. Discusses Japan’s social and political institutions, historical processes, artistic traditions, and cultural exchange.

CLTR 1260. Japanese Film. 4 Hours.
Provides an introduction to Japanese film through works by such great masters as Kurosawa, Mizoguchi, and Ozu, as well as works by new directors from the 1980s and 1990s such as Tami, Morita, and Suo. Offers a critical understanding and interpretation of the culture. Discusses Japan’s social and political institutions, historical processes, artistic traditions, and cultural exchange. Conducted in English.
CLTR 1265. Spanish Civil War on Film. 4 Hours.
Introduces the Spanish film and provides an understanding of the Spanish Civil War (1936-1939). Uses a semiotic approach; studies images of the Spanish Civil War in photographs and posters to show how fictional and historical texts are transferred to the screen. Examines both documentaries and award-winning feature films by prominent Spanish directors. Demonstrates how the realism of the prominent Spanish directors is combined with surrealist imagery and metaphor to create a distinctive visual style. Conducted in English.

CLTR 1280. French Film and Culture. 4 Hours.
Provides an introduction to some of the qualities that have made French film one of the great national cinemas. Focuses on both form and content; relates outstanding directors' major works to the French culture and society of their period. Conducted in English.

CLTR 1290. Realism and Modernism in Italian Film. 4 Hours.
Examines postwar Italian film as a significant site of cultural production, a site where different—and powerful—social tensions, cultural conflicts, and ideological mandates manifest themselves as discourses and as messages whose goal is to shape and define culture. Uses the concepts of realism and modernism as two central modes of organizing cultural discourse. Examines realism and modernism as complex phenomena—as cultural dynamics, as aesthetic approaches, and as modes of philosophical thought. Analyzes Italian films as sites that manifest realism and modernism in each of these dimensions. Seeks, in taking this culturalist approach to film, to place aesthetic production within a broader context than artistic expression—analyzing film style and practice instead as historically specific encounters between film practice and cultural context.

CLTR 1500. Modern Chinese History and Culture. 4 Hours.
Introduces modern Chinese history and culture through literary works, films, and historical texts. Examines political, social, and cultural changes in China since 1800: the decline of empire; the New Culture Movement of the 1920s; the rise of nationalism and rural revolution; the changing roles of women; the Cultural Revolution of the 1960s; and China's cinematic, literary, and economic engagement with the world since 1978. Taught in English and open to all undergraduates. CLTR 1500 and HIST 1500 are cross-listed.

CLTR 1501. Introduction to French Culture. 4 Hours.
Explores contemporary France and French mentality through lectures, screenings, readings, and discussions. Topics covered include the modern vs. the traditional family, social reproduction, gender norms, culture and social distinction, the concept of "grandeur," identity, and immigration. Offers students an opportunity to evaluate historical and sociological readings, films, documentaries, and TV commercials; to compare French and American systems; and to consider contemporary human and social behaviors in the face of globalization.

CLTR 1502. Introduction to Arabic Culture. 4 Hours.
Designed to provide students with an in-depth survey of Arabic culture. Familiarizes students with the roots of one of the richest and oldest cultures but also seeks to satisfy their curiosity concerning certain social norms, patterns, and cultural traits in contemporary Arabic societies. Examines cultural manifestations ranging from the hijab (head covering), Jihad (holy struggle), human rights, polygamy, gender relations, public behavior, and many others by providing the historical backgrounds for these customs and traditions as well as exploring how they are now perceived in various Arab societies as well as in the West. Seeks to provide students with an appreciation for this multifaceted culture but most importantly a broad perspective on Arabic culture within the context of the universal human experience.

CLTR 1503. Introduction to Italian Culture. 4 Hours.
Examines chronologically the main aspects of Italian culture, concentrating on the Middle Ages, the Renaissance, and the modern, postunification period. Topics include art, philosophy, literature, architecture, film, and historical background. Other topics address significant personages in Italian culture, such as Dante, Boccaccio, Piero della Francesca, Leonardo da Vinci, Alberti, Pico della Mirandola, Michelangelo, and Machiavelli; the differences between northern and southern Italy; and the nature of Italy's cultural heritage and its influence and status today. Conducted in English.

CLTR 1504. Introduction to Spanish Culture. 4 Hours.
Examines chronologically the forces that have forged Spanish culture and have made Spain the nation it is today. Traces the development of Spain from the prehistoric caves of Altamira to the present. Observes past and present concerns such as divorce and abortion in a Catholic country, education, the role of women, linguistic diversity, separatism and terrorism, and the incorporation of Spain into the European Community. Incorporates history, sociology, anthropology, geography, economics, and politics. Conducted in English.

CLTR 1505. Introduction to Latin American Culture. 4 Hours.
Introduces students to Latin American culture through the study of a broad array of literary and critical writings by Latin American authors and selected films from Latin America. Authors include Sor Juana, Garcia Marquez, and Jorge Amado. Conducted in English.

CLTR 1506. Introduction to Chinese Popular Culture. 4 Hours.
Provides a comprehensive examination of modern Chinese popular culture in the People's Republic of China, Taiwan, and Hong Kong. From film to literature, from music to theatre, this course probes popular culture as it has manifested itself and traces its sociopolitical, aesthetic, and affective impact on modern China, with special attention to negotiations between the elite and the popular discourses.

CLTR 1508. Cuban History and Culture through Film. 4 Hours.
Offers an overview to Cuban history, culture, and society using a variety of films. Begins with the eighteenth century and issues of colonialism, slavery, and the struggle to create an independent Cuba. Features the early period of independence (1902–1925) and the overthrow of Machado (1933), as it is a period of great change and questioning about the island's cultural and national identity. The latter part of the course focuses on post-1959 Cuba. Topics include colonialism and slavery, the pitfalls of national consciousness, gender relations, the mulatta in Cuba's national culture, race relations, the importance of music in Cuban identity, aspects of Afro-Cuban culture, the nature of underdevelopment, homosexuality, social and political concerns in a revolutionary society, and Cuba in a new globalized environment.

CLTR 1509. An Introduction to Afro-Cuban Culture. 4 Hours.
Offers an overview to Afro-Cuban culture and history. Covers arrival of the first Africans, surge in the Atlantic trade, culture of the plantation, and the process of transculturation in Cuba, pre- and postabolition. Examines the philosophical and religious systems on the island: Regla de Ocha (Santería), the Abakuá society, and Regla de Palo (Mayombe, Kimbisa, Briyumba). Discusses slavery and racism in Cuba's national identity, the intricacies of transculturation (hybrid cultural formations), the African dimensions of Cuban culture, ideas of exclusion and gender, as well as the extraordinary creativity of Afro-Cubans and their centrality to Cuba's culture and history.
CLTR 1510. French Gastronomy and Culture. 4 Hours.
Analyses the relationship between gastronomy, good manners, and French society since the Middle Ages, which is deeply ingrained in French cultural fabric and celebrated around the world as French savoir-faire and savoir-vivre. Explores cultural practices and the role of religious, political, social, and economic forces in shaping the formation of self, class distinction and cultural capital, gender roles and identity construction, permanence and change, and myth and reality in times of transition. When relevant, the course compares the French experience with other countries' modus operandi. Includes films; documentaries; an interview with a French chef; popular culture texts (cookbooks, menus, satirical food critic columns); and philosophical, historical, sociological, and literary texts from Stephen Mennell, Norbert Elias, Pierre Bourdieu, Anthelme Brillat-Savarin, Molière, Alexandre Dumas, and Emile Zola.

CLTR 1515. Comparative Analysis of the Lusophone World and Culture. 4 Hours.
Examines the role of the Portuguese culture, with a particular emphasis on the cultural influences that have shaped the development of the Portuguese-speaking world, also called the "Lusophone" world. Addresses the presence of the Portuguese language and culture beyond national borders and the relevant Portuguese contribution for the movement of globalization. The course is conceived as a mixture of lectures and other cultural activities that can better provide students with an idea of what is Portuguese/Lusophone culture today and what it was in the past. Focuses primarily on the Lusophone Black Atlantic as a space of historical and cultural connections between Portugal, Brazil, and Africa.

CLTR 1575. Jewish Film and Fiction. 4 Hours.
Examines books and short stories with Jewish themes, such as Goodbye Columbus and The Chosen, and some of the films based on those works. Offers students an opportunity to develop critical knowledge of key issues in modern Jewish identity—immigration, assimilation and intermarriage, anti-Semitism, and the Holocaust—through the lens of fiction and film. CLTR 1575 and JWSS 1575 are cross-listed.

CLTR 1700. Introduction to Japanese Pop Culture. 4 Hours.
Provides an introduction to Japanese popular culture through critical analysis of mass media such as film, television, comics, and animation. Investigates various social and cultural issues, such as gender, family, and education. Films and videos supplement readings. Conducted in English.

CLTR 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CLTR 2001. World Cultures through Film. 4 Hours.
Introduces the study of world cinema from the past several decades as a form of artistic and cultural expression. Emphasizes the way that different ethnicities and cultures mix and even clash within national boundaries. Readings cover such topics as the postcolonial inheritance, immigration, the boundaries of class, the pressures of modernization, ethnic identities, and historical memory. Examines storytelling in its multicultural aspects and deals with the diverse influences of entertainment cinema and art cinema, as well as measures taken by countries to limit the influx of foreign films in order to protect their own cultural productivity. One overall concern of the course is the place of film in contemporary global culture.

CLTR 2280. French Film and World War II: The German Occupation of France. 4 Hours.
Explores the fascinating period of the German occupation of France, the so-called black years (années noires). Resistance, collaboration, national identity, and historical memory are still active subjects of debate in France by intellectuals, historians, novelists, and filmmakers. Offers students an opportunity to read historical and eyewitness accounts as well as short fiction to situate the films in context.

CLTR 2475. Gender in Latin American Film. 4 Hours.
Explores gender in Latin America as represented in film, which often reflects how society experiences political and social upheavals. Discusses gender in this context as a focus of power and social legitimacy, a means of collective identity formation, a factor in the allegorization of a nation, and as a nexus of change. Discusses how representations of gender, sexuality, and sexual transgression are utilized to facilitate national mythmaking within national cinemas. Discusses different visions of masculinity, femininity, and transgendered identity and looks at films by and for women in Latin America and other non-dominant-gendered identities. Offers students an opportunity to understand how dominant ideology can be questioned, challenged, and revolutionized through filmic representation.

CLTR 2501. Chinese Film: Gender and Ethnicity. 4 Hours.
Introduces students to cultural, cross-cultural, intellectual, and social issues that lead them to an informed understanding of Chinese film. Selected films are organized under the topics of gender, ethnicity, and urbanity. Outstanding directors are examined closely to illustrate these topics. Conducted in English.

CLTR 2504. Modern German Film and Literature. 4 Hours.
Introduces contemporary issues in German culture. Studies the importance of the Faust legend. Considers major novels. Also considers stories and poems by Böll, Grass, Mann, and Brecht as adapted by a new generation of filmmakers: Fassbinder, Schlondorff, Sanders-Brahms, and Wenders. Conducted in English.

CLTR 2505. Berlin in German Film and Culture. 4 Hours.
Focuses on the evolution of Germany's film aesthetic in relation to German cultural issues and touches on the "new German film" of the postwar era in the West, the influence of neorealism in the East, and the melding of these different traditions in the film of reunified Germany. The centrality of Berlin in Germany's culture and history is reflected in the many films that have used the city as backdrop, from Ruttman's silent masterpiece Berlin, Symphony of a Great City through the flowering of German expressionist cinema and on to World War II, divided Germany, and reunification. Studies directors such as Wenders, Klein, Sanders-Brahms, Fassbinder, Dresen, von Trotta, von Donnersmarck, Becker, and Tykwer.

CLTR 2510. Brazilian Culture through Film. 4 Hours.
Offers an overview of Brazilian film that historically covers the period from colonial times to the present. Twentieth-century themes include issues such as youth and street violence, popular culture and music, religion, the role of women, political and social struggles, homosexuality, cultural identity, and human rights.
CLTR 2715. New Media Narratives in Latin America: Local and Global Dimensions. 4 Hours.
Focuses on Latin America as a region of rich technological creativity in the digital media landscape of the 21st century. Examines how social networks, computational technologies, and digital devices are subjects to creative hacks that incorporate alternative economies and knowledge models and enact social and artistic movements. Examines how hacks or adaptations of new media traverse the local dimensions of the current global technocultural landscape and invite reflection on the multiplex relationships fostered by digital media around the world. Offers students an opportunity to analyze cultural artifacts and phenomena in Latin America in a comparative global setting and engage in innovative expression by creating reflexive multimedia artifacts of their own, replicating the creative and adaptive uses studied in the class. Taught in English.

CLTR 2725. Representing Violence and Human Rights in Latin America. 4 Hours.
Addresses the topics of historical memory and human rights through basic theoretical texts about the concept of violence, memory, and human rights. Students watch films and documentaries and read novels, testimonies, short stories, and poems of several artistic movements, focusing on how violence is represented/visualized in these texts and how it relates to the social, economic, and political situation in Latin America. Studies four moments in recent Latin American history: Mexico 1968; Shining Path and Peru in the 1980s and 1990s; the genocide in Guatemala; and the dictatorships in the Southern Cone. Taught in English.

CLTR 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CLTR 3450. Israeli and Palestinian Film. 4 Hours.
Seeks to open up a dialogue between two cultures that coexist in the same geographical space: the Israeli and the Palestinian. Explores questions of history, identity, conflict, and coexistence through documentary and fiction films. Films are contextualized through extensive readings in secondary sources, poetry, and works of fiction. Requires students to complete several short papers and a final research paper.

CLTR 3500. French Culture and the Arts. 4 Hours.
Designed to provide students with an overview of French culture with a particular focus on its rich artistic heritage as manifested down through history and in popular culture today. Includes such areas as language, art, architecture, cinema, music, literature, urban and landscape design, fashion, folklore, rites, rituals, and customs. Studies the distinctive characteristics of France's many regions in light of their contributions to the vast tapestry that comprises French culture. Conducted in French.

CLTR 3510. Spanish Culture and the Arts. 4 Hours.
Designed to provide students with an overview of Spanish culture with a particular focus on its rich artistic heritage as manifested down through history and in popular culture today. Includes such areas as language, art, architecture, cinema, music, literature, urban and landscape design, fashion, folklore, rites, rituals, and customs. Studies the distinctive characteristics of Spain's many regions in light of their contributions to the vast tapestry that comprises Spanish culture. Conducted in Spanish.

CLTR 3710. Representing Latin American Cities. 4 Hours.
Examines how several Latin American cities have been imagined, represented, written and sung about, and filmed by studying different cultural artifacts and manifestations. Examines works from the fourteenth century until today (from newspapers and popular poetry to blogs and tweets, from paintings to films, from novels to graffiti, from sports to food) that deal in different ways with the "idea" and "imagination" of the cities from their foundation to the present. This is an interactive course and is taught in Spanish.

CLTR 3715. New Narratives: Latin America after 1989. 4 Hours.
Focuses on film, literature, and new media. This course offers a panoramic view of the Latin American cultural production after 1989, attempting to characterize the variety of styles and trends. Relates the texts and movies to the socio, political, and economic issues of the moment, i.e., implementation of neoliberal democracies, globalization, neocolonialism, resistance, new social movements, etc. Also studies links between Latin America and the United States and between Latin America and Spain. Focuses on texts written by relatively young authors. Taught in Spanish.

CLTR 3720. Literature, Arts, and Poverty in Latin America. 4 Hours.
Focuses on the construction, characteristics, and representation of poverty/the poor in Latin American texts from the thirties and sixties and in the works of contemporary Latin American writers and film directors. Discusses the relation of these works to a "realist tradition" by studying social, political, and cultural aspects of Latin America from the nineteenth and twentieth centuries. Considers whether we are facing a new kind of realism. Also engages the problem of representation, the "role of literature" (ethics and literature), and its relation with politics and the global economy (literature and the market) in the Latin American context. Taught in Spanish.

CLTR 3725. Representing Violence and Human Rights in Latin America. 4 Hours.
Studies the idea of violence and how it relates to the social, economic, and political situation in Latin America. Students watch films and documentaries and read novels, testimonies, short stories, and poems of several artistic movements to study how violence is represented/visualized in these texts. Also addresses the topics of historical memory and human rights by using basic theoretical texts about the concept of violence, memory, and human rights. Studies four moments in recent Latin American history: Mexico 1968, Shining Path and Peru in the 1980s and 1990s, the genocide in Guatemala, and the dictatorships in the Southern Cone. Taught in Spanish.

CLTR 3730. Topics in International Cinema. 4 Hours.
Studies international directors, or the cinema of a specific country or ethnic group outside the United States. Students meet for weekly screenings, discussions, and lectures. May be repeated without limit.

CLTR 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

CLTR 4507. Afro-Cuban Culture—International Study. 4 Hours.
Offers students an opportunity to obtain fundamental knowledge of the legacy of African-based cultures in Cuba, from historical to contemporary times. Examines origins of Africans in Cuba, including study of plantation culture, transculturation, African-derived religions, the visual arts, music literature, images of blacks in film and the mass media, and African-derived culture in Cuban daily life. Also includes visits to temples and other ritual spaces, meetings with writers, encounters with artistic troupes, meetings with priests or priestesses, visits to cultural organizations, and possible participation in rituals or ceremonies (tambor, cajón, violin).
Kane, following: Leila Aboulela, writers in the West have presented characters who find in the Qur'an a question the authenticity of the Qur'an itself. After 9/11, however, Muslim social criticism, question Qur'anic texts related to the status of women, or covers selected writers who fairly represent a wide range of Muslim department on a chosen topic. Course content depends on instructor. Offers independent work under the direction of members of the CLTR 4993. Independent Study. 1-4 Hours.

May be repeated without limit.

Offers elective credit for courses taken at other academic institutions.

CLTR 4990. Elective. 1-4 Hours.

Covers special topics in culture. May be repeated without limit.

CLTR 4992. Directed Study. 1-4 Hours.

Offers students a way of going beyond work given in the regular curriculum; may also enable students to complete major or minor requirements in certain situations. Priority is given to language majors and to juniors and seniors. May be repeated without limit.

CLTR 4993. Independent Study. 1-4 Hours.

Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

Culture - Literature (LITR)

LITR 1250. Dante's Inferno and Medieval Italian Culture. 4 Hours.

Introduces an overview of Dante's 'Commedia' focusing on the first book, "Inferno," read in English translation. Examines the descending stages of hell; their meanings; and their social, political, and historical relevance for Dante's society. Dante's 'Divina Commedia' created a powerful world, one that had a deep meaning for both the author and the reader of that time. But can one so easily understand it as constructed by the 'Commedia' in the Middle Ages? Does Dante's world have relevance today as well? Some scholars may say it does more so than ever. If so, how? Through analysis of selected chapters (Canti), students have an opportunity to attempt to establish their possible relevance to the modern human condition and perhaps even to themselves.

LITR 1260. Caribbean Literature and Culture. 4 Hours.

Provides a comparative introduction to the modern literary traditions of the Spanish-, English, and French-speaking Caribbean. Includes authors such as Carpentier (Cuba), Naipaul (Trinidad), Zobel (Martinique), and Cardenal (Nicaragua). Conducted in English.

LITR 1990. Elective. 1-4 Hours.

Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

LITR 2990. Elective. 1-4 Hours.

May be repeated without limit.

LITR 3502. Cervantes and His Times. 4 Hours.

Introduces students to Don Quixote de la Mancha, Cervantes' major work as well as Spain's greatest masterpiece and its supreme gift to Western culture. Studies Cervantes' minor works, The Exemplary Novels and Interludes. Examines literary, sociological, philosophical, and historical matters: the development of the novel, genre and narratology, role-playing and representation, and Spain's triumphs and defeats. Deals with the Spanish Inquisition and censorship, and examines themes such as madness, truth and lying, and appearance and reality. Conducted in English.

LITR 3503. Russian Literature in Translation. 4 Hours.

Surveys and analyzes in English the major works of Russian literature of the nineteenth and twentieth centuries, with emphasis on the historical context. Selected writers include Pushkin, Gogol, Turgenev, Dostoevsky, Tolstoy, and Chekhov.

LITR 3990. Elective. 1-4 Hours.

Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

LITR 4550. From Knights to Revolution. 4 Hours.

Introduces major works of French literature from the Middle Ages up through the eighteenth century. Textual analysis, examination of the social and historical context of these works, and explanations of literary terms and devices through readings and class discussions are designed to contribute to the understanding and appreciation of this body of French literature.

LITR 4508. Cuban History through Film—International Study. 4 Hours.

Offers an overview of Cuban history using Cuban films. Covers the colonial period through times of slavery and the nineteenth-century struggles for independence. Proceeds to the twentieth century, first the republican period (1902–1959), then the revolutionary period (1959 to the present). Touches on topics such as colonialism, slavery, race, women in Cuban history, the anti-Batista struggles of the fifties, underdevelopment, exile, homosexuality, Cuba in the "Special Period" (1991–2005), problems of personal freedom, and identity in revolutionary societies. Also includes visits to historical museums, buildings, monuments, and parts of Havana that reveal the country's history.

CLTR 4944. Cultural Engagement Abroad. 4 Hours.

Designed for a language-based Dialogue of Civilizations. Complements the intensive language course that students take while on a language-based Dialogue. Offers students an opportunity to obtain an in-depth knowledge of the contemporary culture(s) of the country of the Dialogue and how that culture differs from or is similar to contemporary American cultural values and practices. In addition to regular in-class lectures and activities, offers structured opportunities to engage in dialogue with businesspeople, scholars, educators, artists, government officials, journalists, students, senior citizens, and/or local residents about their perspectives on various topics and issues. May be repeated up to three times.

LITR 1150. Muslim Writers and the Qur'an (in English Translations). 4 Hours.

Covers selected writers who fairly represent a wide range of Muslim attitudes to the Qur'an. Muslim writers use the Qur'an for political and social criticism, question Qur'anic texts related to the status of women, or question the authenticity of the Qur'an itself. After 9/11, however, Muslim writers in the West have presented characters who find in the Qur'an a source of positive powers. Readings are drawn from works such as the following: Leila Aboulela, Minaret; Monica Ali, Brick Lane; Gamal Al-Ghitani, Zayni Barakat; Tehmina Durrani, Blasphemy; Nuruddin Farah, Maps; Taha Hussein, An Egyptian Childhood; Yusuf Idris, “A House of Flesh”; C. H. Kane, Ambiguous Adventure; Hanif Kureishi, The Black Album and “My Son the Fanatic”; Naguib Mahfouz, The Children of the Alley.
LITR 4551. Modern French and Francophone Literature. 4 Hours.
Introduces major works of French literature from the nineteenth century on. Textual analysis, examination of the social and historical context of these works, and explanations of literary terms and devices through readings and class discussions are designed to contribute to the understanding and appreciation of this body of French literature.

LITR 4555. French Poetry. 4 Hours.
Provides students with a survey of French poetry through the ages, focusing on representative works of the major French poets. Studies poems in their literary and historical context with an examination of various aspects of French versification. Conducted in French.

LITR 4560. Masterpieces of Spanish Literature: 18th–20th Century. 4 Hours.

LITR 4561. Masterpieces of Spanish Literature: 12th–17th Century. 4 Hours.
Traces the development of Spanish literature from the Middle Ages (las jarchas, El poema del Cid, El libro de buen amor, La Celestina) through the Renaissance and Baroque periods or Golden Age (Garcilaso de la Vega, the picarosque novel, the mystics, Cervantes, Lope de Vega, Calderon). Conducted in Spanish.

LITR 4565. Spanish Golden Age. 4 Hours.
Examines plays by the outstanding dramatists of the seventeenth century in Spain: Lope de Vega, Calderon de la Barca, Tirso de Molina, Ruiz de Alarcon, and others. Conducted in Spanish.

LITR 4655. Latin American Literature. 4 Hours.
Offers an overview of the major trends in Latin American literature, from Bernal Diaz through Borges and Vargas Llosa. Studies broad cultural and political contexts, especially the effect of colonization. Conducted in Spanish.

LITR 4850. The Splendid Century. 4 Hours.
Examines the outstanding dramatists of the seventeenth century in France: Lope de Vega, Calderon de la Barca, Tirso de Molina, Ruiz de Alarcon, and others. Conducted in Spanish.

LITR 4851. Masterpieces of French Literature: Renaissance and Baroque. 4 Hours.
Examines plays by the outstanding dramatists of the sixteenth century in France the age of Louis XIV and Versailles. Readings cover a rich and diverse body of literature encompassing poetry, theatre, philosophy, the novel, and epistolary writing. The authors studied include Corneille, Racine, Molieres, Descartes, Pascal, and La Rocheefoucauld. Conducted in French, with English permitted.

LITR 4860. Age of Enlightenment. 4 Hours.
Studies the eighteenth century in France: the Enlightenment. It was an age of challenge to established authority, institutions, and modes of thought. This intellectual and political vitality is reflected in works of Voltaire, Montesquieu, and Rousseau. It is followed by the awakening of the Romantic sensibility in such authors as Diderot, Rousseau, and Bernardin de St. Pierre. Conducted in French, with English permitted.

LITR 4870. Romantic Heritage. 4 Hours.
Treats French Romanticism and its aftermath from a literary and cultural standpoint. Examines Romanticism in poetry and drama, as well as its continuation into the realist novel. Readings include the works of Lamartine, Hugo, Balzac, and Flaubert. Also explores the development of the Parnassian and Symbolist movements. Readings include the works of Baudelaire, Verlaine, Rimbaud, and Mallarmé, precursors of all modern literature. Conducted in French, with English permitted.

LITR 4983. Special Topics in Literature. 4 Hours.
Covers special topics in literature. May be repeated without limit.

LITR 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

LITR 4992. Directed Study. 1-4 Hours.
Offers students a way of going beyond work given in the regular curriculum; may also enable students to complete major or minor requirements in certain situations. Priority is given to language majors and to juniors and seniors. May be repeated without limit.

Data Science (DS)

DS 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

DS 2000. Programming with Data. 4 Hours.
Introduces programming for data and information science through case studies in business, sports, education, social science, economics, and the natural world. Presents key concepts in programming, data structures, and data analysis through Python and Excel. Integrates the use of data analytics libraries and tools. Surveys techniques for acquiring and programatically integrating data from different sources. Explains the data analytics pipeline and how to apply programming at each stage. Discusses the programmatic retrieval of data from application programming interfaces (APIs) and from databases. Introduces predictive analytics for forecasting and classification. Demonstrates the limitations of statistical techniques.

Accompanies DS 2000. Covers topics from the course through various experiments.

DS 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

DS 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

DS 4100. Data Collection, Integration, and Analysis. 4 Hours.
Studies how to collect data from multiple sources and integrate them into consistent data sets. Covers how to use semi-automated and automated classification to integrate disparate data sets; how to parse data from files, XML, JSON, APIs, and structured data stores to construct analyzable data sets that are stored in databases; and how to assess and ensure quality of data. Introduces key concepts of algorithms and data structures, including divide-and-conquer, sorting and selection, and graph traversal and descriptive analysis of data through descriptive statistics and plotting. Analyzes complexity and run-time behavior of programs. Presents approaches for data anonymization and protecting data privacy. Studies data shaping and manipulation techniques for data analysis and the R and Python programming languages.

LITR 4551. Modern French and Francophone Literature. 4 Hours.
Introduces major works of French literature from the nineteenth century on. Textual analysis, examination of the social and historical context of these works, and explanations of literary terms and devices through readings and class discussions are designed to contribute to the understanding and appreciation of this body of French literature.

LITR 4555. French Poetry. 4 Hours.
Provides students with a survey of French poetry through the ages, focusing on representative works of the major French poets. Studies poems in their literary and historical context with an examination of various aspects of French versification. Conducted in French.
DS 4200. Information Presentation and Visualization. 4 Hours.
Introduces foundational principles, methods, and techniques of visualization to enable creation of effective information representations suitable for exploration and discovery. Covers the design and evaluation process of visualization creation, visual representations of data, relevant principles of human vision and perception, and basic interactivity principles. Studies data types and a wide range of visual data encodings and representations. Draws examples from physics, biology, health science, social science, geography, business, and economics. Emphasizes good programming practices for both static and interactive visualizations. Creates visualizations in Excel and Tableau as well as R, Python, and open web-based authoring libraries. Requires programming in Python, JavaScript, HTML, and CSS. Requires extensive writing including documentation, explanations, and discussions of the findings from the data analyses and the visualizations.

DS 4300. Large-Scale Information Storage and Retrieval. 4 Hours.
Introduces data and information storage approaches for structured and unstructured data. Covers how to build large-scale information storage structures using distributed storage facilities. Explores data quality assurance, storage reliability, and challenges of working with very large data volumes. Studies how to model multidimensional data. Implements distributed databases. Considers multilayer storage design, storage area networks, and distributed data stores. Applies algorithms, including graph traversal, hashing, and sorting, to complex data storage systems. Considers complexity theory and hardness of large-scale data storage and retrieval. Requires use of nonrelational, document, key-column, key-value, and graph databases and programming in R, Python, and C++.

DS 4400. Machine Learning and Data Mining 1. 4 Hours.
Introduces supervised and unsupervised predictive modeling, data mining, and machine-learning concepts. Uses tools and libraries to analyze data sets, build predictive models, and evaluate the fit of the models. Covers common learning algorithms, including dimensionality reduction, classification, principal-component analysis, k-NN, k-means clustering, gradient descent, regression, logistic regression, regularization, multiclass data and algorithms, boosting, and decision trees. Studies computational aspects of probability, statistics, and linear algebra that support algorithms, including sampling theory and computational learning. Requires programming in R and Python. Applications concepts to common problem domains, including recommendation systems, fraud detection, or advertising.

DS 4420. Machine Learning and Data Mining 2. 4 Hours.
Continues with supervised and unsupervised predictive modeling, data mining, and machine-learning concepts. Covers mathematical and computational aspects of learning algorithms, including kernels, time-series data, collaborative filtering, support vector machines, neural networks, Bayesian learning and Monte Carlo methods, multiple regression, and optimization. Uses mathematical proofs and empirical analysis to assess validity and performance of algorithms. Studies additional computational aspects of probability, statistics, and linear algebra that support algorithms. Requires programming in R and Python. Applications concepts to common problem domains, including spam filtering.

DS 4900. Data Science Senior Project. 4 Hours.
Designed to help students develop a sophisticated understanding of data collection, integration, storage, statistical analysis, visualization, and machine-supported analysis and modeling. Requires students to analyze a substantial data set using statistical and visual methods and to build machine-learning models to discover patterns in the data. Results must be communicated in writing. Requires substantial programming in R, Python, Java, or C++.

DS 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

DS 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

DS 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. May be repeated without limit.

DS 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. May be repeated without limit.

DS 4994. Internship. 4 Hours.
Offers students an opportunity for internship work. May be repeated without limit.

DS 4996. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student's approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using it to fulfill their experiential education requirement. May be repeated without limit.

DS 4997. Data Science Thesis. 4 Hours.
Offers students an opportunity to prepare an undergraduate thesis under faculty supervision.

DS 4998. Data Science Thesis Continuation. 4 Hours.
Focuses on student continuing to prepare an undergraduate thesis under faculty supervision.

DS 5010. Introduction to Programming for Data Science. 4 Hours.
Offers an introductory course on the fundamentals of programming and data structures. Covers lists, arrays, trees, hash tables, etc.; program design, programming practices, testing, debugging, maintainability, data collection techniques, and data cleaning and preprocessing. Includes a class project, where students use the concepts covered to collect data from the web, clean and preprocess the data, and make it ready for analysis.

DS 5020. Introduction to Linear Algebra and Probability for Data Science. 4 Hours.
Offers an introductory course on the basics of statistics, probability, and linear algebra. Covers random variables, frequency distributions, measures of central tendency, measures of dispersion, moments of a distribution, discrete and continuous probability distributions, chain rule, Bayes’ rule, correlation theory, basic sampling, matrix operations, trace of a matrix, norms, linear independence and ranks, inverse of a matrix, orthogonal matrices, range and null-space of a matrix, the determinant of a matrix, positive semidefinite matrices, eigenvalues, and eigenvectors.

DS 5110. Introduction to Data Management and Processing. 4 Hours.
Discusses the practical issues and techniques for data importing, tidying, transforming, and modeling. Offers a gentle introduction to techniques for processing big data. Programming is a cross-cutting aspect of the course. Offers students an opportunity to gain experience with data science tools through short assignments. Course work includes a term project based on real-world data. Covers data management and processing—definition and background; data transformation; data import; data cleaning; data modeling; relational and analytic databases; basics of SQL; programming in R and/or Python; MapReduce fundamentals and distributed data management; data processing pipelines, connecting multiple data management and analysis components; interaction between the capabilities and requirements of data analysis methods (data structures, algorithms, memory requirements) and the choice of data storage and management tools; and repeatable and reproducible data analysis.
DS 5220. Supervised Machine Learning and Learning Theory. 4 Hours.
Introduces supervised machine learning, which is the study and design of algorithms that enable computers/machines to learn from experience or data, given examples of data with a known outcome of interest. Offers a broad view of models and algorithms for supervised decision making. Discusses the methodological foundations behind the models and the algorithms, as well as issues of practical implementation and use, and techniques for assessing the performance. Includes a term project involving programming and/or work with real-life data sets. Requires proficiency in a programming language such as Python, R, or MATLAB.

DS 5230. Unsupervised Machine Learning and Data Mining. 4 Hours.
Introduces unsupervised machine learning and data mining, which is the process of discovering and summarizing patterns from large amounts of data, without examples of data with a known outcome of interest. Offers a broad view of models and algorithms for unsupervised data exploration. Discusses the methodological foundations behind the models and the algorithms, as well as issues of practical implementation and use, and techniques for assessing the performance. Includes a term project involving programming and/or work with real-life data sets. Requires proficiency in a programming language such as Python, R, or MATLAB.

Deaf Studies (DEAF)

DEAF 1500. Deaf People in Society. 4 Hours.
Focuses on Deaf communities as linguistic and cultural minorities. Topics include perspectives on Deaf communities, attitudes toward Deaf people and sign languages, technology and communication, the contributions of Deaf people to society, professional and social organizations of and for Deaf people, Deaf clubs as a locus of Deaf culture, communication issues, perspectives on legislation affecting the Deaf community, and the impact of educational options for Deaf children.

DEAF 1550. Dynamics of the Deaf/Blind Community: Culture, History, and Communication. 4 Hours.
Explores the multidimensional aspects of the Deaf/Blind community, culture, communication, and history (dynamics of how society has handled individuals who are Deaf/Blind). Topics are studied from the Deaf/Blind perspective and include oppression and its power structures; empowerment vs. *rescue or fix it*; the loss of sight and its impact on communication; and learning about empathy and the courage of vulnerability. Explores Deaf/Blind culture and the grieving process as an ongoing component of life; different types of Deaf/Blindness and diverse styles of communication; and mobility issues and maintaining independence. A brief introduction to sighted guide techniques and technology available.

DEAF 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

DEAF 2500. Deaf History and Culture. 4 Hours.
Surveys the history and culture of the American Deaf community and Deaf people in the Western world. Focuses on educational, political, and technological forces and events that have positively and negatively affected the American Deaf community. Focuses on the American Deaf community as a linguistic and cultural minority. Also examines contemporary values and factors that shape and define the American Deaf community and compares and contrasts American Deaf cultural values with those of American society in general.

DEAF 2700. ASL Linguistics. 4 Hours.
Introduces the basic issues in linguistics by examining the structural properties of American Sign Language and comparing it with other languages having similar properties. Includes phonology (formational properties of signs), morphology (word formation, rules, derivation, inflection, complex verbs, classifiers, and verb modulations), semantics (the meaning structure of signs), and syntax (the structure of ASL utterances in terms of old vs. new information and the structure of ASL narratives).

DEAF 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

DEAF 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

DEAF 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

DEAF 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

Digital Media - CPS (DGM)

DGM 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

DGM 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

DGM 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

DGM 6105. Visual Communications Foundation. 4 Hours.
Introduces the basic principles and concepts inherent in visual language systems. Covers fundamentals such as visual perception, composition, spatial relationships, color, form, repetition, texture, structure, abstraction, and figure-ground relationships. Student projects focus on visual problem solving with an emphasis on understanding of context, content, and the development of original forms.

DGM 6108. Programming Foundations for Digital Media. 4 Hours.
Offers students an opportunity to learn the fundamentals of programming in a multimedia environment. Emphasizes planning and production for interactive digital media. Using a scripting language as a base, covers how scripting relates to design and programming fundamentals that link logic to action. Topics include graphical user interfaces; user interaction; and algorithmic manipulation of text, graphics, sound, and video.

DGM 6109. Lab for DGM 6108. 2 Hours.
Accompanies DGM 6108. Covers topics from the lecture course through various tutorials and problem-solving exercises.
DGM 6122. Foundations of Digital Storytelling. 4 Hours.
Introduces the fundamentals of character and story development through practical applications in a variety of digital media, from text and storyboarding to sound, moving image, and interactive environments. Offers students an opportunity to become familiar with narrative sequencing and story development, experience the critical role of narrative in linear media, and apply these skills in nonlinear and experimental forms. Students work both individually and collaboratively to develop projects that explore creative storytelling.

DGM 6125. Time-Based Media. 4 Hours.
Introduces the creative potential of time-based media—data that changes with respect to time. Explores concepts of sequencing, transformation, and motion through time and space. Offers students an opportunity to explore the potential of video, 2D, animation, motion graphics, and sound design through hands-on assignments.

DGM 6140. Sound Design. 4 Hours.
Explores the history, theory, and practice of sound design, the creation of aural environments, special effects, dialogue, and music for a variety of traditional and digital media, including film, TV/video, animation, theatre, radio, interactive games, and the Internet. Films such as The Matrix, Citizen Kane, and Star Wars serve as the basis for developing a core knowledge of sound design concepts, particularly the development of critical listening skills. Topics cover “spotting,” digital audio editing and recording, sample libraries, aesthetics of design, music composition, script interpretation, critical listening, professional collaboration, sound and music technology, digital audio production, and production organization. Offers students an opportunity to master core skills, enabling them to communicate effectively with directors, producers, and/or creative artists in the media and entertainment industries.

DGM 6145. Information Technology and Creative Practice. 4 Hours.
Explores interdisciplinary methodologies that promote creativity and stimulate innovative thinking. Information technology (IT) has formed a powerful alliance with art and design to establish the existing new domain of information technology and creative practices (ITCP). The result is an astonishing variety of significant cultural and economic forms ranging from innovative product designs to interactive art installations. Uses case studies and emphasizes the design, planning, and implementation of innovative prototypes.

DGM 6168. Usability and Human Interaction. 4 Hours.
Surveys the theory and practice of human-computer interaction and the development of user interfaces. Through both analysis and design projects, students have an opportunity to learn cutting-edge approaches to usability research and evaluation, testing methods, and how to design systems that meet end-user needs. Topics covered include behavioral and cognitive foundations of interaction design, principles of good design for interaction, basic user research techniques, and the process of user-centered design.

DGM 6217. Typography for Interactivity. 4 Hours.
Explores the basic principles of typographic design, particularly as applied to screen-based media. Topics include screen legibility and resolution, hierarchy and scale, and typographic form and style.

DGM 6230. Digital Media Entrepreneurship. 4 Hours.
Focuses on the personal characteristics necessary to become a successful entrepreneur, as well as on the processes of evaluating an idea, assessing the market, and implementing a new venture, whether inside an organization or as an independent startup. Teaching methods include case study, guest speakers with entrepreneurial experience, lectures, and team projects that develop feasible business plans. Offers students an opportunity to evaluate their potential as entrepreneurs by learning how to identify and evaluate business opportunities, develop a business concept and marketing plan, assess and obtain the required resources, manage the growth of new ventures, and plan for exit strategies.

DGM 6268. Usable Design for Mobile Digital Media. 4 Hours.
Offers students an opportunity to apply the user-centered, human-computer interaction (HCI) skills covered in DGM 6168 to mobile digital media experiences such as game, entertainment, and social media applications. Considers digital media design, aesthetics, and user behavior in mobile-based environments in the creation of a satisfying and engaging experience. Offers students an opportunity to understand best design practices on a mobile platform by applying HCI methods such as iterative design and the evaluative methods of heuristic evaluation and play testing.

DGM 6279. Project Management for Digital Media. 4 Hours.
Introduces the project management life cycle for technology-based products and applications. Beginning with project initiation and assembling a team, offers students an opportunity to apply project management principles to all aspects of planning and managing a project, including scheduling and budgeting. Major topics include managing a team, including setting goals for creatives; managing assets; documentation; deadlines and client expectations; and balancing continuous improvement and rapid prototyping against the need to manage the scope of work.

DGM 6280. Managing for Digital Media. 4 Hours.
Surveys evolving best practices in creative industry management. Begins with the recognition that managing in an environment of innovation and creative media requires a radical rethinking of traditional managerial paradigms. Agile response to technological change requires strategic alternatives in company goals, priorities, and direction. Intellectual content and creativity are difficult to value within classic financial models. New devices and social networks demand responsive action in internal and external communications. Correctly valuing the performance of highly creative people can be key in maintaining or gaining a leadership position. Uses case studies, presentations, and team-based analysis to examine these challenges and discuss effective responses.

DGM 6285. Interactive Marketing Fundamentals. 4 Hours.
Introduces the exploration of messaging in current and evolving media outlets, the digital marketing mix, the growing promise of mobility, and the possibilities and pitfalls of marketing in social media. Marketing has been deeply challenged by the move from traditional to digital channels, as print and TV give way to Web sites and mobile devices as primary centers of information and entertainment. Explores Web analytics, in particular search engine marketing (SEM) and search engine optimization (SEO).
DGM 6290. Social Media and Brand Strategy Implementation. 4 Hours. Offers students an opportunity to develop the context for working with marketing professionals to implement strategy in a variety of social media, from blogs to social networking sites, and from game worlds to content communities. Social media environments have become a prime target for product and personal marketing, advertising, and supporting a brand image. But their differences from passive media and even standard websites have made it more difficult to apply traditional thinking to these digital media channels. Utilizes lectures, research, projects, and case studies.

DGM 6300. Digital Capture and Output. 4 Hours. Introduces still digital imaging, emphasizing image optimization, image editing, and image preparation for screen-based display using software such as Adobe Lightroom and Photoshop. Topics include digital camera settings and exposure methodology, file types, color modes and color management, image correction, layer and channel tools, and digital workflow. Experience with an SLR camera is strongly recommended.

DGM 6302. Work Flow in Digital Imaging. 4 Hours. Offers students an opportunity to explore alternative outcomes in image processing and to work with high-end image capture and RAW camera files to produce large-format and high-resolution prints. Seeks to improve the quality and efficiency of the student's workflow process. This is an intermediate-level course.

DGM 6305. Color Management in Still Digital Imaging. 4 Hours. Demonstrates and utilizes ICC profiles, monitor calibration, and color management of digital files for different output media and purposes. Explores optimization for Web-based applications and proofing and a variety of color spaces. DGM 6500 or prior image-editing experience recommended.

DGM 6307. Creative Approaches to Still Digital Imaging. 4 Hours. Explores purely creative approaches to the still digital image. Topics include collaging, appropriating, and legal issues; assembling; and alternative modes of working digitally for final print-based outputs and other high-end fine-art output. Explores longer-term projects and portfolio preparation.

DGM 6308. Intermediate Programming for Digital Media. 4 Hours. Offers students an opportunity to extend the basic proficiency in scripting languages gained in DMG 6108 to more sophisticated programming tasks using an industry-standard scripting language such as JavaScript. Covers the use of arrays and objects to structure data and apply object-oriented and event-driven programming principles to create sophisticated interactivity.

DGM 6317. Screen-Based Publication Design. 4 Hours. Introduces the theory and practice of designing books, magazines, and interactive hybrid narratives for touch screens. Offers students an opportunity to become familiar with grids, style sheets and templates, and output to a variety of e-publishing tools as they explore the differences in designing content for the Web, tablets, and smartphones.

DGM 6322. Advanced Digital Storytelling. 4 Hours. Builds on concepts introduced in DGM 6122. Explores the ideation and production of more complex, nonlinear interactive narratives. Working intensively in a team setting, offers students an opportunity to explore ways to further integrate a variety of narrative elements into immersive experiences.

DGM 6300. Game Design Fundamentals. 4 Hours. Provides the foundation for all of the other courses in the graduate specialization and/or certificate in game design. Offers students an opportunity to learn the basic principles of game design through the creation of board and card games, and through video-game prototyping. Also offers an opportunity to develop skills, including graphic and written communication, rules logic, group dynamics, and basic programming logic.

DGM 6405. Game Development. 4 Hours. Introduces video game programming using a game engine. Building on their work from DGM 6400, students have an opportunity to create single-player computer games using industry-standard scripting languages. Projects focus on sound design, two-dimensional design and animation, or three-dimensional design and animation. Students can develop projects as individuals or as part of a team.

DGM 6408. Game Design Algorithms and Data Structures. 4 Hours. Offers an overview of advanced programming techniques used in the creation of sophisticated digital experiences. Offers students an opportunity to extend the programming knowledge covered in DGM 6308 and DGM 6405. Topics include physics, artificial intelligence, and other forms of game simulation.

DGM 6410. Game Design Technology Lab. 4 Hours. Offers students an opportunity to explore recent technological advances in game design, including networked multiplayer gaming, 3D gaming, and alternative user interfaces such as cameras and motion/location-sensing devices. Student teams are encouraged to round out their game-design portfolios by developing a sophisticated videogame demo that focuses on a specific theme and technology.

DGM 6430. Screenwriting: Linear and Interactive. 4 Hours. Introduces and builds on basic elements of traditional scriptwriting. Offers students an opportunity to develop their creative writing skills by developing a screenplay for either a film/video production or an interactive/immersive project. Emphasizes dialogue, dynamic role-playing, story generation, and character development for actors and animated characters. Requires proficiency in English or a TOEFL writing score of 27 or above.

DGM 6435. Digital Video Production. 4 Hours. Using digital video cameras, students are introduced to field production skills and basic content editing. Students are encouraged to implement and experiment with ideas developed in DGM 6122 as they complete short videos. Through hands-on practice and discussion, as well as the viewing of classic documentary and fiction film/video examples, students have an opportunity to further explore composition of the frame and meanings produced from inter-shot and sequence relationships.

DGM 6440. Editing in the Digital Studio. 4 Hours. Uses virtual studio spaces to introduce and develop student comfort with non-linear digital editing. Offers students an opportunity to understand the basic principles of composition, pacing, titling, timecodes and video effects. Working with their own material, existing video clips, animations, still images and audio feeds, students are encouraged to experiment with different styles, methods, and output to gain a comprehensive understanding of the medium. DGM 6506 or prior experience with digital video editing is strongly recommended.
DGM 6450. Animation Basics. 4 Hours.
Explores the creative potential of animation. Exposes students to animation processes and techniques through lectures, demonstrations, and hands-on assignments. Provides a historical survey of animation art. Emphasizes using the computer to creatively develop concepts while learning the fundamental skills of constructing images and forms. Students collaborate on projects during the first half of the course and work individually on final projects.

DGM 6451. Web Development. 4 Hours.
Focuses on intermediate to advanced concepts and techniques for development of professional Web environments. Offers students an opportunity to explore different development strategies, including client-side interactions using AJAX libraries (such as JavaScript, PHP, and MySQL) compared with client/server methods, webpage presentation layer vs. interactive layer, and the use of WYSIWYG (what you see is what you get) tools vs. plain-text coding.

DGM 6452. Convergence Creation. 4 Hours.
Explores emerging and converging distribution models for time-based digital content through hands-on projects. Focuses on mobile video, mobile audio/podcasts, blogging, and Flash-based handheld content. Examines core questions, such as how to develop compelling content for these different delivery platforms, how to develop content that translates across these platforms, and what the user/audience's expectations are for these different types of narratives. Projects are supplemented by contemporary readings. DGM 6501 or prior website-creation experience recommended.

DGM 6453. Illustrator Intensive. 2 Hours.
Focuses on vector-based illustration, the basis for clean-edged, professional illustrations in a variety of media. Offers students an opportunity to become comfortable editing a short video for content, preparing it for posting on the Web, and/or including it in an interactive media project.

DGM 6502. Working with Sound. 2 Hours.
Introduces digital audio concepts and techniques for Web and interactivity. Covers digital recording and editing and simple signal processing. Offers students an opportunity to learn the basics of generating sound files in formats appropriate for Web pages and Flash files.

DGM 6503. Flash Intensive. 2 Hours.
Provides instruction in the Macromedia Flash development environment. Includes creating original animated material, importing external media resources, and basic use of interactive tools.

DGM 6504. ActionScript (Intensive). 2 Hours.
Introduces more advanced programming concepts, including loops, arrays, object-oriented programming, and ActionScript 2.0 syntax. This course is suitable for beginning programmers with some Flash animation experience (such as that provided in DGM 6503).

DGM 6505. Modeling and Rendering (Intensive). 2 Hours.
Concentrates on the basics of computer modeling and rendering techniques using Autodesk’s Maya 3D animation program. It is highly recommended for any student interested in animation but with no prior experience in professional three-dimensional content creation. It can be taken concurrently with DGM 6450 or as a precursor to it.

DGM 6506. Introduction to Digital Video. 2 Hours.
Uses industry-standard software to introduce editing and compression techniques critical for effective participation in digital video production and editing courses. Offers students an opportunity to become comfortable editing a short video for content, preparing it for posting on the Web, and/or including it in an interactive media project.

DGM 6507. Illustrator Intensive. 2 Hours.
Focuses on vector-based illustration, the basis for clean-edged, professional illustrations in a variety of media. Illustrator is the premier software for producing vector art. Offers students an opportunity to obtain the tools and techniques necessary to master the creation of vector-based, scalable artwork and typography for digital media applications.

DGM 6508. Game Development Intensive. 4 Hours.
Offers students an opportunity to apply the experience gained in DGM 6108 to programming for game development. Game engines provide quick-start platforms and industry-standard solutions for developing video games. The Unity 3D game engine is used for multiplatform game development and is also a rapid prototyping tool for the Wii, PlayStation, and iOS devices. Begins at the introductory Unity level.

DGM 6509. Integrated Suite Workshop. 2 Hours.
Introduces cross-application interaction for media design and development in an intensive workshop format. Software tools are now designed to have many functions interact and overlap under one connected umbrella. Understanding the basics of these tools to work with them efficiently can be key to the creation of effective digital media.

DGM 6510. 3-D Modeling. 4 Hours.
Introduces the fundamentals of three-dimensional computer animation. Class lectures and demonstrations are followed by substantial hands-on exploration. Offers students an opportunity to gain fundamental skills for polygon modeling and UV surfacing. Projects progress from creating simple geometric objects to realistic organic characters.
DGM 6511. Web Creation Bootcamp 2. 2 Hours.
Offers an intensive workshop designed to build on the foundations of web creation built in DGM 6501. Offers students an opportunity to work intensively with web software and web technologies such as xHTML, PHP, and JavaScript to design websites with layered imagery, basic interactivity, and more complex layouts.

DGM 6513. Single-Lens Reflex Camera Workshop. 2 Hours.
Offers students an opportunity to become familiar with the techniques and terminology that set professional-quality creative work apart from point-and-shoot. In still or motion photography, professional results require digital single-lens reflex (SLR) mastery. This workshop covers exposure, focus, flash, white balance, resolution, file formats, histograms, and basic SLR video, as well as theories of light and color crucial to understanding SLR camera settings and choices. Students have in-class access to cameras, but SLR camera ownership is strongly recommended to get the most out of this course.

DGM 6514. HTML5 Workshop. 2 Hours.
Offers students an opportunity to become familiar with HTML5 syntax, structural markup, and its connections to languages such as JavaScript, jQuery, and CSS. HTML5 is a significant technology for creating complex and rich interactions in games, mobile environments, and websites. It provides a rich alternative for Flash-enabled development.

DGM 6515. Introduction to After Effects. 2 Hours.
Introduces the creation and manipulation of motion graphics and time-based visual effects using the After Effects environment. Offers students an opportunity to acquire the basic knowledge required for DGM 6540.

DGM 6518. Game Programming Intensive 1. 2 Hours.
Explores an advanced game development environment in a workshop setting. Offers students an opportunity to concentrate deeply on an industry-standard development tool to expand their game design and interactive development options to new devices and environments.

DGM 6519. Game Programming Intensive 2. 2 Hours.
Builds on the development methods and environment introduced in DGM 6518. Offers students an opportunity to complete their mastery of an advanced game development environment.

DGM 6520. Lighting for the Camera. 4 Hours.
Emphasizes essential lighting theory and techniques. Understanding lighting is the key to a professional photographic or video shoot. Topics include lighting equipment; lighting sources and arrangement; color temperature; lighting for indoor, outdoor, and location shooting; as well as the editorial use of lighting to create tone and communicate narrative. Offers students an opportunity to create projects in different lighting environments and for different purposes to experience a wide range of lighting problems and solutions.

DGM 6521. Web Creation for Content Management Systems. 2 Hours.
Expands on the foundations of web creation with an emphasis on developing for content management systems such as WordPress. Offers students an opportunity to work intensively to use web technologies to build on these open-source software models’ core capabilities. Requires basic knowledge of cascading style sheets (CSS) and beginner knowledge of PHP.

DGM 6525. Research Methods for Global User Experiences. 4 Hours.
Focuses on a structured approach to user research methodology for the design of interactive applications. Emphasizes user research and interpretation for products and services that will be marketed to individuals spanning cultures with radically different customs and communication. Applies field methods such as interviewing, observation, and questionnaire design through the lens of intercultural psychology and communication patterns, cultural neutrality, and culture-centric design.

DGM 6530. Character Animation. 4 Hours.
Provides an in-depth investigation of 3-D animation. Offers students an opportunity to continue development of realistic characters created in DGM 6510 and to develop intermediate skills for weight mapping and rigging, as well as midlevel proficiency with animation editors. Projects focus on creating animations that emphasize realistic deformation and movement.

DGM 6531. Rigging Workshop. 2 Hours.
Introduces fundamental rigging principles and techniques. Convincing animation of 3D characters and objects requires rigging—the setup and scripting of a range of structural controls. Offers students an opportunity to explore character preparation and motion control methods, including inverse and forward kinematics, and complete an intuitive rig for a character developed in DGM 6530. This is an intensive workshop.

DGM 6532. Rigging Workshop 2. 2 Hours.
Offers an intensive workshop that continues and expands on the skills in structural controls begun in DGM 6531. Offers students an opportunity to apply a variety of realistic motion effects to character and environmental elements, including realistic modeling of fluids, fire and smoke, explosions, fur, hair, cloth, and particles.

DGM 6535. Rigging Principles and Techniques. 4 Hours.
Offers animation students the opportunity to apply realistic motion effects to a complete, intuitive character rig. Convincing animation of 3D characters and objects requires rigging—the setup and scripting of a range of structural controls. Explores character preparation and motion control; kinematics; realistic motion effects, including textures such as fur and hair; and environmental elements, such as fluids, fire, and explosions.

DGM 6540. Compositing. 4 Hours.
Investigates compositing and special FX techniques. Student teams have an opportunity to utilize green screen studio to capture live-action video footage that is seamlessly combined with computer-generated environments and characters that they create. Offers students an opportunity to develop original narratives that are suitable for exploring course objectives.

DGM 6545. Documentary and Nonfiction Production. 4 Hours.
Offers students interested in documentary filmmaking an opportunity to learn the research, story structure, and production skills necessary to bring a nonfiction video narrative from preproduction through postproduction and refine their work from rough to final cut. Using scenes and examples from notable documentaries to inspire and illustrate technique, students research topics, find subjects, conduct interviews, practice techniques of cinema verité and B-roll, and work with archival footage to complete one major nonfiction project.

DGM 6550. Search Engine Optimization: Strategy and Implementation. 4 Hours.
Connects the search engine optimization (SEO) process to marketing and social media strategy by introducing students to the concepts behind consumer search behavior, search engine algorithms, and SEO analysis using tools such as Google Analytics. A website’s frequency ranking in a content search critically impacts its visibility and, ultimately, viability. Seeks to provide foundational guidance on topics such as organic search tactics, website optimization, and keyword research and selection.

DGM 6880. Portfolio. 2 Hours.
Offers an intensive seminar designed to help students develop a digitally based portfolio to meet professional standards in their area. Offers students an opportunity to examine existing work, to consider new projects, and to learn to present and package their process and ideas effectively. May be repeated once.
DGM 6882. Animation Reel. 1-4 Hours.
Offers students an opportunity to develop a portfolio reel that may be suitable for submission to potential employers. Emphasizes sound integration and efficient use of polygonal structures. Focuses on student-generated projects; weekly goals are determined by aesthetic and technical demands of student objectives.

DGM 6890. Thesis Proposal Development. 2 Hours.
Offers students an opportunity to understand thesis goals and process, with a view toward developing strong project ideas, an effective and realistic development path, and a well-written preliminary proposal.

DGM 6895. Digital Portfolio Capstone. 4 Hours.
Offers an intensive, directed project that seeks to help students design and develop a digitally based portfolio. Offers students an opportunity to research standards and expectations in their field, examine their existing work critically, and present and package their process and ideas effectively. May be taken concurrently with DGM 7990. Requires prior completion of 37 quarter hours in the digital media program with concentration in interactive design or permission of instructor.

DGM 6943. Integrative Experiential Learning. 3,4 Hours.
Offers students an opportunity to apply the principles, tools, and processes of digital medial to real-world problems in profit and nonprofit organizations through a customized variety of experiential options. These opportunities may range from participation in the co-operative education program to Experiential Network (XN) projects.

DGM 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

DGM 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

DGM 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

DGM 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

DGM 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

DGM 6980. Capstone. 1-4 Hours.
Offers students an opportunity to work on individual and collaborative projects in their area of concentration, including digital video, digital audio, or animation.

DGM 6983. Topics. 1-4 Hours.
Offers students the opportunity to study, through research and experimentation, in a specified discipline. May be repeated without limit.

DGM 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

DGM 7961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

DGM 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions.

DGM 7976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. May be repeated up to three times.

DGM 7978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

DGM 7980. Capstone. 6 Hours.
Offers students an opportunity to demonstrate competency in core digital media topics and concentration-based learning outcomes through the development of a research-based project.

DGM 7983. Topics. 1-4 Hours.
Covers special topics in digital media. May be repeated without limit.

DGM 7990. Thesis. 6 Hours.
Offers students an opportunity to complete a digital media project, researched and proposed by the student and directed by one or more members of the faculty. The thesis project can be an individual endeavor or the result of a collaboration involving two or more students in the program.

DGM 7994. Thesis Continuation—PT. 0 Hours.
Offers continuing thesis supervision by members of the department.

DGM 7995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

DGM 7996. Thesis Continuation. 0 Hours.
Offers continuing thesis supervision by members of the department.

ENVR 1000. Marine and Environmental Sciences at Northeastern. 1 Hour.
Intended for first-year students in the College of Science. Introduces students to liberal arts; familiarizes them with their major; develops the academic skills necessary to succeed (analytical ability and critical thinking); provides grounding in the culture and values of the University community; and helps to develop interpersonal skills—in short, familiarizes students with all skills needed to become a successful university student.

ENVR 1101. Environmental Science. 4 Hours.
Focuses on the complex array of topics that collectively form the discipline of environmental science. Emphasizes the problems facing today’s natural, human-managed, and coupled human/natural ecosystems and the solutions to those problems. Studies the human dimensions of environmental science, including culture, politics, worldviews, ethics, and economics, particularly within the context of global climate change. Offers students an opportunity to learn to analyze data as a means of exploring relationships among societal and ecological drivers affecting economic, ecological, and socioeconomic stability, to learn how the scientific method is used to separate fact and data from opinion; and to apply these methods to explore the causes and solutions to global climate change.

ENVR 1103. Age of Dinosaurs. 4 Hours.
Utilizes evidence from the sedimentary rock record to evaluate and interpret significant biological and physical events in Mesozoic earth history. Changes in the Earth’s landscape due to variations in climate, plate tectonics, and sea level provide the background for detailed consideration of Mesozoic life. Emphasizes the evolutionary history of dinosaurs and provides detailed data for testing hypotheses of evolutionary mechanisms, paleobiogeography, functional anatomy, ecology and community structure, and extinction and extinction models.
ENVR 1100. Natural Disasters and Catastrophes. 4 Hours.
Provides an overview of what we know about the causes, locations, and effects of some of the most important natural disasters such as earthquakes, floods, and hurricanes. Also examines how loss of life and property damage can be minimized by implementing geologic knowledge. Briefly examines less common but possibly more devastating catastrophes such as large volcanic eruptions, large meteorite impacts, and rapid climate change.

ENVR 1110. Global Climate Change. 4 Hours.
Analyzes Earth's modern climate system and natural climate change over Earth's 4.5-billion-year history. Examines ongoing and future climate change. Includes expected impacts of the predicted climate changes as well as mitigation and adaption options.

ENVR 1111. Weather and Climate. 4 Hours.
Discusses the patterns and processes that combine to produce our daily weather and how weather integrates over time to define climate. Identifies natural and human-made causes of climate change.

ENVR 1112. Environmental Geology. 4 Hours.
Investigates geologic processes such as flooding, volcanic eruptions, and earthquakes, as well as strategies for safer land use incorporating geologic information. Exercises completed and discussed in class offer hands-on experience with evaluating geologic factors that impact land use and formulating hazards mitigation strategies. Offers students an opportunity to increase their understanding of problems resulting from the interaction of humans with the geologic environment and how we can more appropriately interact with it.

ENVR 1120. Oceans and Coasts. 4 Hours.
Explores the marine and coastal realm and the problems that arise from the human-marine relationship. Begins by studying the history of the ocean and ends with how to create a more sustainable marine world. Topics covered include ocean and estuarine circulation, climate change and ocean response, and the plant and animal life thriving in different parts of the ocean. Includes reading and analyzing the scientific literature, developing and presenting research projects, and group work.

ENVR 1121. Marine Resources. 4 Hours.
Provides a qualitative and quantitative survey of renewable and nonrenewable resources from the sea. Topics include coral reefs, shellfish, marine mammals, sharks, sport and recreational fishing, clams, lobsters, shrimp, toxic seafood, energy from the ocean, ocean pollution, shore erosion, beaches, coastal zone recreation, marine law, and law of the sea.

ENVR 1140. Physical Geography. 4 Hours.
Introduces physical geography for students in history, political science, economics, or other social sciences who intend to pursue a career in education or other social sciences.

ENVR 1145. Volcanoes. 4 Hours.
Offers students an opportunity to understand how volcanoes work, why volcanoes occur, where volcanoes occur, and what their impacts have been throughout human history and prehistoric times. Also address strategies for safer land use around active volcanoes.

ENVR 1200. Dynamic Earth. 4 Hours.
Offers a systematic study of the materials and systems comprising the earth. Emphasizes the processes that form, transport, alter, and destroy rocks, as well as the nature and development of landscape. Plate tectonics theory is introduced as a guiding paradigm in geology.

ENVR 1201. Lab for ENVR 1200. 1 Hour.
Accompanies ENVR 1200. Covers exercises pertaining to mineral and rock identification and topographic and geologic map interpretation. Required for environmental geology and geology majors.

ENVR 1202. History of Earth and Life. 4 Hours.
Traces biological and environmental development of the earth over the past 4.6 billion years using evidence preserved in the rock record. A primary goal is to understand how geoscientists interpret earth history by learning how to test hypotheses and develop explanations for events that occurred far in the geologic past. Examination of major earth systems, the biosphere, lithosphere, atmosphere and hydrosphere, reveals how they interact to control the origin of earth, the origin and evolution of life, the causes and effects of extinction, plate tectonics and mountain building, and climate change over earth history.

ENVR 1203. Interpreting Earth History. 1 Hour.
Focuses on students using sedimentary rocks, fossils, and geologic maps and stratigraphic sections to record and to interpret events in earth history.

ENVR 1445. Environment and Humankind. 4 Hours.
Offers an ecological analysis of human interaction with other organisms. Presents the necessary foundation of biological principles.

ENVR 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENVR 2310. Earth Materials. 4 Hours.
Describes the physical and chemical characteristics of common rock-forming minerals and geologic processes that form rock and soils in the igneous, sedimentary, and metamorphic environments. Focuses on commonly encountered minerals, soil, and rock types and how these are used to interpret past and present earth processes. This is a writing-intensive course with a required term paper.

ENVR 2311. Lab for ENVR 2310. 1 Hour.
Accompanies ENVR 2310. Cover topics from the course through various experiments.

ENVR 2340. Earth Landforms and Processes. 4 Hours.
Focuses on the origin and evolution of landscape features by processes operating at or near the earth's surface. Exercises introduce interpretation of air photos, topographic maps, remotely sensed data, and digital elevation models.

ENVR 2341. Lab for ENVR 2340. 1 Hour.
Accompanies ENVR 2340. Covers topics from the course through various experiments.

ENVR 2500. Biostatistics. 4 Hours.
Offers an overview of traditional and modern statistical methods used to analyze biological data using the free and open-source R programming environment. Lectures describe core statistical approaches and discuss their suitability for understanding patterns that arise at different levels of biological organization, from cellular processes to whole ecosystems. Supervised lab sessions offer students an opportunity to develop the R programming skills required to analyze the complex datasets that often emerge when addressing cutting-edge questions in biology. Topics include basic probability and sampling theory, experimental design, null hypothesis significance testing, t-tests and ANOVA, correlation and regression, Monte Carlo simulations, likelihood, generalized linear models, model selection, and information theory.

ENVR 2501. Lab for ENVR 2500. 1 Hour.
Accompanies ENVR 2500. Offers supervised lab sessions demonstrating how topics covered in the lectures can be addressed in the R programming environment.

ENVR 2900. Special Topics in Environmental Studies. 4 Hours.
Studies various topics on environmental issues. May be repeated without limit.
ENVR 2941. Ocean Science and Public Policy. 4 Hours.
Provides students with a fundamental understanding of the intersection between climate change and government policy. After an introduction to the development of maritime law and sovereignty on the high seas, students examine why societies funded oceanic research, far from home territory, in the first place. The course also explores the interrelationship between science and government policy through selected case studies including the UN Conference on the Law of the Sea, the Intergovernmental Panel on Climate Change, the Kyoto Protocol, and cases presented in the World Court relating to industrialized nations’ greenhouse gas emissions and sea level change in the Pacific. Requires acceptance into the SEA Semester Program.

ENVR 2942. Maritime History and Culture: The Caribbean. 4 Hours.
Explores political, cultural, and social changes in the Caribbean since before Europeans arrived at the end of the fifteenth century. Starting from the maritime landscape of winds, currents, islands, and harbors, we see how the physical nature of the region has influenced patterns of settlement and development from the time of the Arawaks and Caribs to the commodification of the Caribbean as a modern tourist destination. Other topics include the impact of European expansion on peoples throughout the Atlantic world, especially at the transportation of some 5 million enslaved Africans into the Caribbean region; at the technology that underpinned European expansion; and at the cultural expressions that document the extraordinary demographic changes that transformed the islands. Requires acceptance into the SEA Semester Program.

ENVR 2943. Marine Environmental History: The Caribbean. 4 Hours.
Explores the interaction of ecological factors in ocean, coastal, and island environments; the impact of human actions on those environments; and the need for local, regional, and international responses and strategies to mitigate and manage that impact. The enormous environmental changes that have taken place in the Caribbean Islands over the last five centuries provide us with a regional example of global issues. Looks at issues of resource exploitation, pollution, development, and the introduction of non-native species and attempts to understand the process by which we come to an intelligent understanding of these issues. Requires acceptance into the SEA Semester Program.

ENVR 2944. Oceanography. 3 Hours.
Introduces students to the scientific study of the ocean. Teaches basic understanding of global ocean processes and a more in-depth understanding of the waters through which students sail during their subsequent Sea Component. Covers the four interrelated disciplines of oceanography—physics, chemistry, biology, and geology. The development of proposals for independent student research projects to be carried out at sea is a key component of this shore-based course. Opportunities are provided to discuss current research with scientists working at the cutting edge of marine science. Includes lectures, labs, and field trips. Labs may include study of a coastal pond or salt marsh as an introduction to data collection, processing, chemical analyses, and microscopy that are used onboard ship. Part of the SEA Semester Program. Requires acceptance into the SEA Semester Program and completion of three lab science courses.

ENVR 2949. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENVR 3000. Igneous Petrology and Volcanology. 4 Hours.
Examines the origin and nature of igneous rocks in general and volcanoes in particular. Surveys the characteristics and classification of igneous rocks, with a special emphasis on studying volcanic eruptive products and the nature of volcanic eruptions. Also covers the environmental impact and monitoring of volcanic activity.

ENVR 3001. Lab for ENVR 3000. 1 Hour.
Accompanies ENVR 3000. Exercises emphasize the identification and classification of igneous rocks as seen in hand specimen and with the aid of a petrographic microscope.

ENVR 3100. Oceanography. 3 Hours.
Examines the role of the oceans in the climate system, addressing topics such as the global carbon cycle, the thermohaline circulation, and aspects of global change including warming and sea level rise. As a sink and a buffer for carbon dioxide in the atmosphere, and as a major mechanism of heat transport between the equator and high latitudes, the role of the oceans in setting the Earth’s climate is indisputable. Requires acceptance into the SEA Semester Program and completion of three lab science courses.

ENVR 3101. Nautical Science. 3 Hours.
Provides the theoretical background necessary for operating vessels at sea through lectures, lab sessions, field trips, and student projects. Covers the principles of navigating a vessel within sight of land; discussions include the earth’s coordinate system of latitude and longitude, nautical charts, and the magnetic compass. Students are also introduced to electronic navigation, including radar and GPS (Global Positioning System), and celestial navigation to fix the navigator’s position at sea. Topics include Archimedes’ principle, Newton’s laws, the Bernoulli effect, Boyle’s law, and mechanical advantage as applied to the study of vessels and their operation; vessel handling under sail; center of effort; operations under power; and vessel design. Classroom lectures, discussions, and student projects focus on learning about global, regional, and local weather. Part of the SEA Semester Program. Requires acceptance into the SEA Semester Program.

ENVR 3102. Maritime Studies. 3 Hours.
Focuses on a multidisciplinary study of the sea and sea voyage in the Western tradition and the role of the sea in the historical development of the modern world system of labor, trade, and scientific resource management. Tales of the sea from literature are supplemented with classic films, paintings, and songs. Together, students explore the expectations that they, as products of American popular and high culture, bring to their impending sea voyage. Through further readings, lectures, and field studies, students explore the uses we have made of the sea—from fishing and whaling to scientific exploration and warfare—with an eye toward understanding the roots of contemporary maritime affairs. Part of the SEA Semester Program. Requires acceptance into the SEA Semester Program.

ENVR 3103. Oceanographic Field Methods. 4 Hours.
Introduces students to the skills and knowledge of the practicing oceanographer by observation and application of the concepts and sampling techniques introduced onshore. Tasks include carrying out routine lab procedures; extracting physical data for students’ research projects and for SEA’s ongoing oceanographic studies; processing chemical and biological samples; safely programming, deploying, and recovering oceanographic equipment; and maneuvering and positioning the vessel for each research station. Each day students participate in lectures, discussions, or hands-on study of specific topics in oceanography and nautical science. Part of the SEA Semester Program. Requires acceptance into the SEA Semester Program.
ENVR 3104. Advanced Oceanographic Field Methods. 4 Hours.
Continues ENVR 3103. Focuses on the completion of student research projects and increasing responsibility for routine lab work, the sampling program, and operation of the vessel. The goal is for students to oversee the lab watch, direct their peers, plan and carry out station work with minimal staff supervision, finish analyzing and interpreting their data, complete written research papers, and present their research in a formal seminar format. May culminate with one or more ship’s missions, which usually involves study of a particular area, either for SEA’s data collections or at the request of another scientific agency, and allows students to integrate their nautical and science knowledge and to direct the vessel and its operation. Part of the SEA Semester Program. Requires acceptance into the SEA Semester Program.

ENVR 3105. Practical Oceanographic Research. 3 Hours.
Guides students at sea from an introductory learning phase to increasing responsibility in station planning, equipment deployment, and data interpretation. Each day, students participate in lectures, discussions, or hands-on study of specific topics in oceanography, nautical science, or maritime studies. Students also receive individual and small-group instruction by the scientific and nautical staff during regular watches in the lab and on deck. Focuses on analyzing and interpreting data, completing a written research paper, and presenting the research to the ship’s company in a formal seminar format. The end of the cruise may also culminate in one or more missions, allowing students to integrate their nautical and science knowledge and to direct the vessel and its operation. Part of the SEA Semester Program. Requires acceptance into the SEA Summer Session Program.

ENVR 3125. Global Oceanic Change. 4 Hours.
Explores major changes in physical, biological, and chemical properties of the ocean over geological and human timescales. Includes origin and early evolution of the oceans; sea-level change; global warming; ocean acidification; the role of plate tectonics in driving long-term oceanic change; the role of atmospheric carbon dioxide in driving short-term oceanic change; tipping points in the oceans; snowball earth theory; marine pollution; oil exploration; and social, economic, and political implications of oceanic change. Themes include differentiating drivers of change across multiple temporal and spatial scales; evaluating change from different and sometimes conflicting perspectives (social, economic, political, environmental); differentiating local and global change; and establishing linkages between physical, chemical, and biological processes in the ocean. Requires prior completion of one laboratory science course or permission of instructor.

ENVR 3200. Water Resources. 4 Hours.
Offers students who wish to work in the area of water resources an opportunity to understand the issues related to water’s availability and behavior at the Earth’s surface. Topics covered include (1) the hydrologic cycle, including global and regional patterns of water movement; (2) characteristics of surface and groundwater systems, including the linkage between streams, rivers, lakes, wetlands, groundwater, and the sea; (3) water management issues and regulations that have been enacted to control the use of water as a resource; (4) water quality measures for surface water and groundwater; and (5) examples of water use conflicts and emerging water issues. Case studies include examples from California, New England, New York, the southwestern United States, China, Africa, and the Middle East.

ENVR 3300. Geographic Information Systems. 4 Hours.
Studies how to use a geographic information system (GIS). Explores the practical application of GIS to support scientific and social inquiry, analysis, and decision making. Topics include spatial data collection; data accuracy and uncertainty; cartographic principles and data visualization; geographic analysis; and legal, economic, and ethical issues associated with using GIS. Investigates case studies from geology, environmental science, urban planning, architecture, social studies, and engineering. Provides extensive hands-on experience with a leading commercial GIS software package. Offers students an opportunity to conceive their own research problem that can be addressed using GIS and reach conclusions that are summarized in a professional report. Students who do not meet course prerequisites may seek permission of instructor.

ENVR 3301. Lab for ENVR 3300. 1 Hour.
Accompanies ENVR 3300. Covers topics from the course through various experiments.

ENVR 3302. Introduction to Remote Sensing. 4 Hours.
Explores the fundamental concepts of remote sensing of the environment. Topics include digital imagery from spacecraft, conventional and high-altitude aerial photography, orthophotography production, and surface modeling systems. Offers hands-on experience with basic functions of industry standard image processing software. Students who do not meet course prerequisites may seek permission of instructor.

ENVR 3303. Lab for ENVR 3302. 1 Hour.
Accompanies ENVR 3302. Covers topics from the course through various applied activities.

ENVR 3400. Field Geology. 4 Hours.
Provides hands-on training in field mapping techniques for geologic applications. Emphasizes making field observations of rocks and geologic structures and depicting them on geologic maps, cross sections, and in field notes. Meets at various field locations in the area. Fulfills the college's experiential education requirement for geology majors.

ENVR 3410. Environmental Geochemistry. 4 Hours.
Provides a context for understanding environmental problems through studies in atmospheric, terrestrial, freshwater, and marine geochemistry. Topics include aqueous geochemistry, environmental chemical analysis, nature and source of hazardous wastes (environmental chemistry, reduction, treatment and disposal), acid rain, ozone hole, nuclear winter, green engineering, and alcohol production.

ENVR 3418. Geophysics. 4 Hours.
Studies the basic techniques of reflection and refraction seismology and earthquake analysis; gravity and magnetic and georeferencing methods; radioactive decay principles and Earth’s heat flow; and how information from these methods are used to interpret the nature and age of the Earth’s surface and interior. Emphasizes near-surface exploration, data collection methods, data analysis, and using data to constrain mathematical models of the subsurface distribution of geologic units.

ENVR 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENVR 4106. Coastal Processes. 4 Hours.
Examines the effect of coastal marine processes and the resultant coastal responses. Topics include the dynamics of waves and currents and the associated erosion, transportation, and deposition of sediment-forming beaches, barrier islands, and cliffed shorelines.

ENVR 4107. Lab for ENVR 4106. 1 Hour.
Accompanies ENVR 4106. Covers topics from the course through various experiments.
**ENVR 4500. Applied Hydrogeology. 4 Hours.**
Covers the origin, distribution, and flow of groundwater in permeable sediments and bedrock; hydrological and geological characteristics of aquifers; regional flow systems emphasizing rock structure, stratigraphy, and other aspects of the geological environment; principles of hydrogeologic mapping and analysis; and introduces well testing and well hydraulics. Uses methods of collecting data about the physical distribution and properties of water and its interaction with geologic materials in the subsurface, including its chemical composition, and mathematical models to interpret the direction and velocity of groundwater flow. Considers remediation strategies for dealing with contaminated water in the subsurface.

**ENVR 4501. Lab for ENVR 4500. 1 Hour.**
Accompanies ENVR 4500. Covers topics from the course through various experiments.

**ENVR 4504. Environmental Pollution. 4 Hours.**
Surveys pollution in our atmosphere, on land, and in our oceans. Offers students an opportunity to develop the skills to understand the sources, processes, and fate of environmental contaminants in surface and groundwater, soils, sediment, and biota, with special focus on organic contaminants. Links environmental chemistry with ecotoxicology through an understanding of bioaccumulation, food web models, and risk assessment. Uses case studies and real-world scenarios to illustrate important concepts. Emphasizes innovative solutions for pollution remediation. Discusses current pollution issues and how to clearly communicate these issues to a broad audience. Students who do not meet course prerequisites may seek permission of instructor.

**ENVR 4505. Wetlands. 4 Hours.**
Presents an interdisciplinary overview of the physical, biological, and cultural aspects of wetlands. Topics covered include definitions, classification systems, origins, human use, and natural processes of wetland environments. Offers students an opportunity to learn about wetland hydrology, soils, and vegetation and their relationship to ecosystem processes, societal values, and management. Includes reading and analyzing the scientific literature and conducting in-class activities.

**ENVR 4515. Sustainable Development. 4 Hours.**
Focuses on the development of communities in an environmentally sustainable way and on the division of natural resources within these communities and the global system. Defines and discusses "sustainable development" and its global role today. Exposes students to a history of developmental methods while learning about the interconnectedness of development and the environment. Encourages students to draw conclusions about the environmental impacts of these methods and to consider more equitable uses of natural resources.

**ENVR 4563. Advanced Spatial Analysis. 4 Hours.**
Provides an in-depth evaluation of theoretical, mathematical, and computational foundations of geographic information systems (GIS). Topics include spatial information theory, database theory, mathematical models of spatial objects, and GIS-based representation. Examines advanced concepts and techniques in raster-based GIS and high-level GIS modeling techniques. May be repeated without limit.

**ENVR 4900. Earth and Environmental Science Capstone. 1 Hour.**
Designed for students enrolled in concert with an approved 500–600-level environmental studies course (check with department office for up-to-date listings). Faculty help students to identify topics for individual research tailored to students’ interests and the course content. Provides an opportunity for reflection about what the student has learned in the major, in their NU Core course work, and experiential learning. Required components include writing with revision and an oral presentation at a department-wide capstone seminar late in the semester.

**ENVR 4965. Undergraduate Teaching Experience 1. 4 Hours.**
Offers an opportunity for qualified undergraduate students to serve as undergraduate teaching assistants. Requires various assignments closely directed by the assigned course instructor. May include holding office hours, light grading, maintaining the records for the course, proctoring—but not solely administering—exams and quizzes, holding recitation/tutorial sessions, and (very) limited lecturing or leading class discussions. Requires minimum overall GPA of 3.333 and grade of A– or better in course assignment; permission to enroll is further subject to the availability of an appropriate course assignment and instructor.

**ENVR 4966. Undergraduate Teaching Experience 2. 1 Hour.**
Offers an opportunity for qualified undergraduate students to continue to serve as undergraduate teaching assistants. Requires various assignments closely directed by the assigned course instructor. These may include holding office hours, light grading, maintaining the records for the course, proctoring—but not solely administering—exams and quizzes, holding recitation/tutorial sessions, and (very) limited lecturing or leading class discussions. May incur a one-credit overload charge. Requires minimum overall GPA of 3.333 and grade of A– or better in course assignment; permission to enroll is further subject to the availability of an appropriate course assignment and instructor.

**ENVR 4970. Junior/Senior Honors Project 1. 4 Hours.**
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8-credit honors project. May be repeated without limit.

**ENVR 4971. Junior/Senior Honors Project 2. 4 Hours.**
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

**ENVR 4990. Elective. 1-4 Hours.**
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

**ENVR 4992. Directed Study. 1-4 Hours.**
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

**ENVR 4993. Independent Study. 1-4 Hours.**
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

**ENVR 4994. Internship. 4 Hours.**
Offers students an opportunity for internship work. May be repeated without limit.

**ENVR 4996. Experiential Education Directed Study. 4 Hours.**
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using the course to fulfill their experiential education requirement. May be repeated without limit.

**ENVR 4997. Senior Thesis. 4 Hours.**
Offers students an opportunity to prepare an undergraduate thesis under faculty supervision.
ENVR 5105. Geophysics. 4 Hours.
Examines the physical processes of sediment erosion, transportation, and deposition and the origin of sediment. Emphasis is on the effect of coastal marine processes and resultant responses of the coast. Topics include the dynamics of waves and currents and such coastal landforms as beaches, barriers, salt marshes, and bluff and rocky coasts. (a) ENVR 1112, ENVR 1200, or graduate standing and (b) MATH 1241, MATH 1251, MATH 1341, or graduate standing and (c) junior, senior, or graduate standing.

ENVR 5110. Coastal Sedimentation. 4 Hours.
Examines a current environmental issue or topic through an understanding of the scientific principles controlling the process, review of alternative actions, and inquiry into societal implications of the issue. Topics include groundwater supply, groundwater contamination, coastal erosion and flooding, or impacts of land development.

ENVR 5115. Advanced Topics in Environmental Geology. 4 Hours.
Examines selected topics in geology through an understanding of the basic processes, materials, and evolution. Topics include basin analysis, landfill evolution, volcanology, or regional geology. May be repeated without limit.

ENVR 5120. Advanced Topics in Geology. 4 Hours.
Introduces spatial data analysis through geographical information system (GIS) systems. Topics include basics of cartography, cartographic transformations on the computer, data input, data sorting and presentation, and statistical analysis. Emphasis is on practical applications of GIS methods. May be repeated without limit.

ENVR 5190. Soil Science. 4 Hours.
Provides a description and evaluation of the physical, chemical, and biological properties of soils. Includes soil formation, soil types, and processes that occur in soil including the importance of these processes for the soil productivity and management of soil. Also covers sources, reactions, transports, and fates of chemical species in soils and associated water and air environments, as well as the chemical behavior of elements and compounds and the phenomena affecting natural and anthropogenic materials in soils.

ENVR 5200. Geology Seminar. 4 Hours.
Offers an analysis of selected topics in geology for advanced study. Topics are selected from current areas of active research in the field. May be repeated without limit.

ENVR 5201. Geologic Field Seminar. 4 Hours.
Studies aspects of geology/environmental science associated with a particular field setting, in the classroom, followed by an intensive field investigation. Examples include carbonate petrology and reef ecology, then field studies in the Bahamas; glacial geology and volcanology, followed by field studies in Iceland; or stratigraphy of the U.S. Southwest, with field studies in the Grand Canyon. Focuses on using field observations and field data to interpret modern and ancient geologic processes. May be repeated without limit.

ENVR 5202. Environmental Science Field Seminar Abroad. 4 Hours.
Offers an intensive environmental science field study experience associated with a particular off-campus geographic setting, such as Iceland, Newfoundland, Bahamas, etc. Offers students an opportunity to learn the principles of field study, to learn to recognize and record significant data, and to reach conclusions about a range of field-based problems being studied. May be repeated without limit.

ENVR 5210. Environmental Planning. 4 Hours.
Examines aspects of surface runoff from geomorphic and hydrologic perspectives. Develops methods for description and calculation of major river and drainage basin processes and applies the results to the planning process. Examines human modification of these systems—including urbanization, dams, and channelization—and applies this information to an understanding of regulatory processes. This is a writing-intensive course.

ENVR 5230. Structural Geology. 4 Hours.
Focuses on the description and origin of rock structures, with emphasis on interpretation of the mechanics of deformation. Lab analyses of structural features and problems utilize geologic maps, structural models, stereograms, petrographic microscope, rock specimens, and field exercises.

ENVR 5231. Lab for ENVR 5230. 1 Hour.
Accompanies ENVR 5230. Covers topics from the course through various experiments

ENVR 5240. Sedimentary Basin Analysis. 4 Hours.
Examines aspects of surface runoff from geomorphic and hydrologic perspectives. Develops methods for description and calculation of major river and drainage basin processes and applies the results to the planning process. Examines human modification of these systems—including urbanization, dams, and channelization—and applies this information to an understanding of regulatory processes. This is a writing-intensive course.

ENVR 5241. Lab for ENVR 5240. 1 Hour.
Accompanies ENVR 5240. Lab work uses geologic sections, suites of sedimentary rocks and thin sections, and drill cores and bore hole logs to interpret and analyze the geologic history and environmental and economic potential of sedimentary basins.

ENVR 5242. Ancient Marine Life. 4 Hours.
Examines aspects of surface runoff from geomorphic and hydrologic perspectives. Develops methods for description and calculation of major river and drainage basin processes and applies the results to the planning process. Examines human modification of these systems—including urbanization, dams, and channelization—and applies this information to an understanding of regulatory processes. This is a writing-intensive course.

ENVR 5243. Lab for ENVR 5242. 1 Hour.
Accompanies ENVR 5242. Introduces marine fossil morphology by study of fossil specimens of all major groups. Principles of paleoecology and evolutionary theory are illustrated by analysis of suites of fossil specimens.

ENVR 5244. Sedimentation. 4 Hours.
Describes the physical processes of sedimentation and their role in the interpretation of sedimentary environments.

ENVR 5245. Lab for ENVR 5244. 1 Hour.
Accompanies ENVR 5244. Concentrates on the interpretation and description of the physical properties of sediments and sedimentary environments.

ENVR 5248. Marine Geology. 4 Hours.
Examines aspects of surface runoff from geomorphic and hydrologic perspectives. Develops methods for description and calculation of major river and drainage basin processes and applies the results to the planning process. Examines human modification of these systems—including urbanization, dams, and channelization—and applies this information to an understanding of regulatory processes. This is a writing-intensive course.

ENVR 5250. Geology and Land-Use Planning. 4 Hours.
Studies the causes and solutions of geologic environmental problems related to land use. Emphasizes geologic-based land-use planning solutions to problems related to landslides, ground subsidence, coastal erosion, stream erosion, flooding, soil erosion, and groundwater pollution. Assignments are based on actual examples requiring application of concepts covered in the course.
ENVR 5260. Geographical Information Systems. 4 Hours.
Examines geographical information systems (GIS), a way to input, store, analyze, and display spatial data (data with a geographic location). Introduces the major components and applications of this exciting new tool. Consists of two lectures and one laboratory period a week. Laboratory exercises introduce methods of data analysis as well as practical issues of how to manipulate various GIS software packages.

ENVR 5262. GIS Workshop. 2 Hours.
Studies the basic techniques of reflection and refraction seismology, gravity, aeromagnetic and heat-flow processes, and the information they provide on the structure, composition, and dynamics of the earth’s interior.

ENVR 5270. Glacial and Quaternary History. 4 Hours.
Examines the environmental conditions conducive to forming glaciers, the processes of ice movement, glacial erosion, modes of deposition, and the resulting landforms created under and around glaciers. Introduces the natural climate change of the ice age cycles and the major events of the Quaternary period.

ENVR 5271. Lab for ENVR 5270. 1 Hour.
Accompanies ENVR 5270. Covers topics from the course through various experiments.

ENVR 5290. Engineering Geology. 4 Hours.
Explores engineering geology, the interdisciplinary study of how geology is applied to engineering projects. Covers the application of geologic thought and geophysical methods to the site selection and planning of human-constructed features, such as foundations, landfills, highways, dams, tunnels, power plants, and mines. An individual research project augments class activities.

ENVR 5300. Graduate Research. 4 Hours.
Offers an individual research project under the direction of a faculty member. May be repeated without limit.

ENVR 5400. Marine Science Policy and Ethics. 3 Hours.
Offers ethics training for a critical review of marine policies in the following topical areas: marine environmental ethics (conservation and preservation), conflicts of interest/research integrity, human subjects/ mammal protections, ethical challenges in marine science modeling, ethics of fishing governance (marine conservation and regulations), sustainability models for marine sciences, data management, and new models of comanagement and community engagement with marine research. Reviews critical environmental policies affecting marine resources (NEPA, CERCLA, RCRA, Endangered Species, Marine Mammal Protection, and Oil Pollution acts, Magnuson-Stevens Act, etc.). Critically evaluates case studies and ethical review of coastal management for sustainability and pollution control, marine fisheries, and energy development.

ENVR 5976. Directed Study. 1-4 Hours.
Offers independent study of a specific topic not normally contained in the regular course offerings but within the area of competence of a faculty member. May be repeated without limit.

ENVR 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ENVR 5984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.
GEO 6505. Geology and Engineering Design. 4 Hours.
Focuses on the role of geology in engineering design. Explores the structure and composition of the Earth, as well as some of the factors that have shaped it, including earthquakes, volcanic eruptions, erosion, and weathering. Offers students an opportunity to learn several ways to depict the Earth’s surface and landforms utilizing different mapping techniques and skills. Investigates engineering principles and how to apply them to mitigate the effect of these changes by analyzing basic building principles and applying them to the design and construction of a model of an earthquake-resistant building.

GEO 6515. Boston Rocks: The Geology of Boston. 4 Hours.
Designed to give students without prior field experience a working knowledge of the bedrock and glacial development of the Boston metropolitan area. Offers students an opportunity to explore Boston’s unique landscape and study the geological contributions of the area to its life and architecture.

GEO 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

GEO 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GEO 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

GEO 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

GEO 6983. Topics. 1-4 Hours.
Covers special topics in earth and environmental sciences. May be repeated without limit.

GEO 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ESC 1250. The Environment and Society. 3 Hours.
Examines the impact of scientific discoveries and technological advances in the context of sustainability. Offers students an opportunity to explore exponential technologies, visions of the future, and the limits of prognostication with respect to their career fields and with an eye to impacts of society in general.

ESC 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ESC 2100. Planetary Science. 3 Hours.
Examines the origin and context of Earth. Topics include the structure of our solar system, structure of the sun and cycles of solar activity on Earth systems, atmospheric and geologic processes in our solar system, current explorations, and future issues.

ESC 2200. Natural Disasters: Evaluating Risk, Minimizing Loss. 3 Hours.
Integrates material from the core courses regarding a scientific understanding of how the Earth interacts violently with human-created environments. Focuses on actual vs. perceived risk and mitigation techniques.

ESC 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ESC 3100. Introduction to Geographical Information Systems. 3 Hours.
Offers a hands-on introduction to the use of a geographic information system (GIS). Topics include spatial data collection; data accuracy and uncertainty; cartographic principles and data visualization; geographic analysis; and the legal, economic, and ethical issues associated with the use of a GIS.

ESC 3200. Wetlands Ecosystems. 3 Hours.
Explores biochemical and geochemical processes of wetland environments. Presents the complexity of classification schemata management issues and protection strategies.

ESC 3210. Air, Water, and Life: Pollution. 3 Hours.
Focuses on major pollutants affecting the hydrosphere and atmosphere, their sources, chemical interactions, effects, and mitigation techniques.

ESC 3220. Water on and Underground: Geochemistry and Hydrology. 3 Hours.
Examines biogeochemical cycles affecting freshwater resources, including the fundamentals of aquatic chemistry. Using the principles of hydrology, the movement of water through the Earth system is measured and forecast, especially as it pertains to flooding.

ESC 3230. Soils and Sustainability. 3 Hours.
Discusses the genesis, structure, classification systems, chemical and biological components, and processes of soils. Explores degradation issues and management of these issues.

ESC 3240. Energy: Sources and Issues. 3 Hours.
Examines carbon fuels, nuclear, wind, solar, and geothermal sources of energy from multiple disciplinary perspectives, including scientific, geopolitical, and economic.
ESC 3250. Urban Ecology. 3 Hours.
Provides students with an opportunity to conduct research under faculty supervision. Topics include urban ecology, environmental science, and sustainable development. May be repeated without limit.

ESC 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ESC 4850. Environmental Assessment and Remediation. 3 Hours.
Focuses on the creation of environmental impact statements and plans for remediation. Topics include solid waste management, wastewater treatment, and air pollution.

ESC 4891. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision. May be repeated without limit.

ESC 4892. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ESC 4893. Independent Study. 1-4 Hours.
Offers students an opportunity to undertake special research.

ESC 4894. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

ESC 4895. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

ESC 4896. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student's approved experiential activity and integrates it with study in the academic major.

ESC 4950. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

ESC 4955. Project. 1-4 Hours.
Reviews the theory and practice of environmental permitting and environmental assessment. Topics include major federal and state environmental regulations, the environmental permitting process, risk assessment and management, and environmental compliance. May be repeated without limit.

ESC 4983. Topics. 1-4 Hours.
Offers students the opportunity to apply the principles of environmental science to current topics of concern. Examples may include protection of special biomes and resources, hazardous waste management, energy production and resources, land-use issues, etc. Emphasizes understanding specific problems and the solutions proposed to solve or mitigate them. May be repeated without limit.

ESC 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ESC 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ESC 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

ESC 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EEMB 1122. Physical Oceanography. 4 Hours.
Provides a description of the physical properties and composition of seawater, waves, tides, and ocean currents. Discusses how these properties are measured by oceanographers and how they influence the ocean's environment and climate.

EEMB 1123. Biological Oceanography. 4 Hours.
Covers the productivity of plant and animal life in the various zones of the ocean and the growing economic importance of the oceans as a source of food for the expanding world population.

EEMB 1145. Beginning Scuba. 1 Hour.
Focuses on basic skin diving and scuba diving skills, with emphasis on safety. Requires lab fee. Requires ability to pass a swim test and basic comfort in the water.

EEMB 1450. Introduction to Marine Biology. 4 Hours.
Surveys the tremendous diversity of marine organisms in the context of the major marine ecosystems in which they are found. Explores interactions among organisms and how the physical and chemical environment influence marine organisms. Links changes on land to declines in organism numbers and diversity and explores the benefits humans gain from our relationship with the marine environment. Offers opportunities to investigate recent advances and understanding of marine organisms and their environments. Requires freshman or sophomore standing; open to juniors and seniors with permission of instructor; intended for students not majoring in marine biology or environmental science.

EEMB 1900. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EEMB 2290. Ecology and Evolution of Behavior. 4 Hours.
Studies fundamental biological principles at behavioral, ecological, and evolutionary levels. Covers ethology, ecology, genetics, and comparative psychology, all within the conceptual framework of evolutionary theory. Explores both scientific practice and progress through readings, discussion, and projects. Illustrates the process by which biologists study questions about the evolutionary origin of behavior through a series of in-class activities, computer modeling assignments, interpretation of graphical data, collection and statistical analyses of behavioral data, as well as the generation and presentation of research. Does not focus on the neurological basis of behavior. Offers students an opportunity to become critical thinkers, critical readers, and to attain tools to interpret the world in a unique way. Requires permission of advisor.

EEMB 2302. Ecology. 4 Hours.
Offers students an opportunity to learn about the environmental and biological processes that control the distribution and abundance of species and controlling factors that operate on individuals, populations, and communities. The lecture and laboratory introduce a set of generalizable concepts that are of fundamental importance to plant and animal life on the land and in the sea and provide hands-on experiential learning that reinforce concepts covered in lecture. Offers students an opportunity to become proficient in the following: (a) understanding research results the primary literature; (b) conducting a research experiment; (c) interpreting the results of in-class research; (d) communicating results as manuscript.

EEMB 2303. Lab for EEMB 2302. 1 Hour.
Accompanies EEMB 2302. Covers topics from the course through various experiments.
EEMB 2400. Introduction to Evolution. 4 Hours.
Introduces evolutionary thinking, including contemporary examples of evolution. To understand the evolution of Charles Darwin’s “endless forms most beautiful,” the course adopts an integrative approach that includes information from ecology, genetics, molecular biology, biogeography, and paleobiology. Considers mechanisms of evolutionary change—how does it happen? Examines adaptation, the process by which attributes of an organism change to enhance fitness and the evolutionary history of life on our planet—what was the first living thing, how does speciation occur, what have we learned about evolution of life in the distant past, and how did humans evolve. Includes student presentations and analysis of scientific literature.

EEMB 2410. Fish Biology and Ecology. 4 Hours.
Covers fish evolutionary relationships, functional morphology, global biogeography, reproductive behavior, and basic ecology. Considers how fishes interact with each other and with their environment across multiple scales. Focuses on how basic life requirements such as habitat use, behavior, foraging, and reproduction lead to variation among individuals, affect population dynamics, and impact the structure and function of community organization and ultimately how these processes influence broad-scale patterns and dynamics at the ecosystem level.

EEMB 2411. Lab for EEMB 2410. 1 Hour.
Accompanies EEMB 2410. Covers topics from the course through various experiments.

EEMB 2420. Fisheries Biology, Policy, and Conservation. 4 Hours.
Focuses on the study and management of economically valuable fish species. Studies the basic biology and ecology of fisheries species, quantifying and modeling their population biology to their interactions with each other and the environment. Requires students to read and analyze the scientific literature, to complete worksheets and writing assignments, and to develop and present research projects. Covers traditional stock assessment methods as well as how fisheries science and management has evolved more recently to integrate community- and ecosystem-level information. Reviews fisheries and how fishers are managed, their involvement in the management process, and the future fisheries in the United States and elsewhere.

EEMB 2610. Plant Biology. 4 Hours.
Examines the biology and diversity of plants and plant-like organisms. Explores the relationships between humans and plants by looking at plants through three different perspectives: feeding a starving world; curing a sick world; and engineering a better world. Employs case studies to highlight major themes.

EEMB 2611. Lab for EEMB 2610. 1 Hour.
Accompanies EEMB 2610. Covers topics from the course through various experiments.

EEMB 2616. Invertebrate Zoology. 4 Hours.
Surveys the tremendous diversity of invertebrates, emphasizing their form and function in ecological and evolutionary contexts. Explores functional morphology, systematics, phylogenetic relationships, ecology, and economic importance of the major invertebrate phyla. Discusses comparisons among phyla to enhance understanding of evolutionary relationships.

EEMB 2617. Lab for EEMB 2616. 1 Hour.
Accompanies EEMB 2616. Covers topics from the course through various experiments.

EEMB 2618. Vertebrate Zoology. 4 Hours.
Explores functional morphology, systematics, ecology, and phylogenetic relationships of the major vertebrate phyla.

EEMB 2619. Lab for EEMB 2618. 1 Hour.
Accompanies EEMB 2618. Covers topics from the course through various experiments.

EEMB 2700. Marine Biology. 4 Hours.
Examines biological aspects of natural ocean ecosystems and the physical processes that regulate them. Covers distributions, abundances, and interactions of marine organisms; interactions between organisms and the transformation and flux of energy and matter in marine ecosystems; and aspects of physiology related to marine species distributions, abundances, and roles. Students generate, evaluate, discuss, and present data from primary research and apply their knowledge of the scientific method and biological concepts through the creation of a written grant proposal.

EEMB 2701. Lab for EEMB 2700. 1 Hour.
Accompanies EEMB 2700. Covers topics from the lecture course through discussions and experiments.

EEMB 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EEMB 3120. Physical Biology of Marine Organisms. 4 Hours.
Introduces principles from the physical sciences (fluid and solid mechanics, mass and heat transfer theory) applied to the analysis of form, function, ecology, and evolution of marine organisms. Topics covered include suspension and deposit feeding in invertebrates, allometry of metabolic processes, drag and lift in sessile organisms, locomotion of nekton (fishes, marine mammals) and plankton, diffusive limitations to metabolic transactions in marine invertebrates and algae, thermal transactions in intertidal organisms, the biology of the benthic boundary layer, and the properties of biomaterials and biological structures. Presents engineering methods and measurement techniques applicable to biomechanical investigations.

EEMB 3450. Physiological Adaptations to the Environment. 4 Hours.
Explores the evolutionary mechanisms by which organisms adapt physiologically to survive, and thrive, in diverse, often seemingly “hostile,” habitats. Examines paleo- and modern examples of adaptation with the goal of predicting species success or failure as our planetary environment changes rapidly. Topics include adaptation of cellular metabolism, adaptations to variable oxygen availability and to changes in pH, the roles of water and microsolutes in regulation of the internal environment of cells, and the effects of temperature on cellular function and the biogeographic distribution of organisms. Includes student presentations and analysis of scientific literature. Requires junior or senior standing; sophomores admitted by permission of instructor; EEMB 2400 or ENV 2400 recommended but not required.
EEMB 3460. Conservation Biology. 4 Hours.
Explores conservation biology, an interdisciplinary science that focuses on conservation of biological diversity at multiple levels. Emphasizes the causes and consequences of biodiversity loss and demonstrates how ecological and evolutionary principles are applied to conservation problems. Covers sustainability; climate change; introduced species; conservation of threatened and endangered species; and pollution, disease, and habitat restoration using examples from marine, aquatic, and terrestrial systems. Offers students an opportunity to read, discuss, evaluate, and present data from primary research through written assignments and oral debates and to apply this knowledge to conservation issues. Emphasizes critical thinking, problem solving, and recognizing multiple perspectives.

EEMB 3465. Ecological and Conservation Genetics. 4 Hours.
 Offers an overview of ecological and conservation genetics, an interdisciplinary science that focuses on understanding the processes that determine genetic diversity at the individual to population level. Focuses on fundamental concepts in evolutionary ecology and population and quantitative genetics, then applies these concepts to solving real-world problems in conservation science. Covers harvested populations, inbreeding, climate change, introduced species, conservation of threatened and endangered species, adaptation, and habitat restoration. Exposes students to multiple sides of these issues and the science that underpins them. Offers students an opportunity to develop the R programming skills required to analyze the complex data sets that often emerge when addressing cutting-edge questions in genetics. Includes writing and coding exercises and mathematical derivations. Emphasizes critical thinking and problem solving.

EEMB 3475. Terrestrial Wildlife Ecology. 4 Hours.
Discusses wildlife ecology and management, mainly focusing on terrestrial species. Topics include habitat use, behavior, wildlife conservation, parasites and pathogens, wildlife sampling, and wildlife management. Offers students an opportunity to participate in activities in which they look at and interpret wildlife data. Course format includes group work, analyzing the scientific literature, and in-class activities. Requires sophomore or junior standing; open to seniors with permission of instructor.

EEMB 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EEMB 4001. Landscape and Restoration Ecology. 4 Hours.
Topics include ecosystem processes, spatial patterns, disturbance, species distributions, invasive species, and habitat loss. Offers students an opportunity to participate in activities in which they look at and interpret spatial data. Course format includes group work, analyzing the scientific literature, and in-class activities. Requires sophomore or junior standing; open to seniors with permission of instructor.

EEMB 4010. Mammalogy. 4 Hours.
Studies the mammals of the world, including their evolution, morphology, physiology, behavior, and ecology. Students conduct a research project in which they investigate the morphology, evolution, ecology, and behavior of a species and present their findings to the class. Includes reading and analyzing the scientific literature and conducting in-class activities.

EEMB 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EEMB 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

EEMB 5130. Ecological Dynamics. 4 Hours.
Offers a comprehensive overview of mathematical and computational concepts needed to construct (meta)population, (meta)community, and (meta)ecosystem models. Focuses on how to mathematically derive and model processes (growth, trophic and nontrophic species interactions, dispersal, and environmental variability) to understand patterns of population abundance and species diversity. Emphasizes the mathematical tools required to analyze the dynamical behavior of ecological models (stability, invasion, graphical, and numerical analyses) and validate model predictions using empirical data (via maximum likelihood and optimization methods). Sophomores admitted by permission of instructor.

EEMB 5131. Lab for EEMB 5130. 1 Hour.
Accompanies EEMB 5130. Offers supervised lab sessions designed to show how the topics covered in the lectures can be addressed in industry-standard programming environments.

EEMB 5506. Biology and Ecology of Fishes. 3 Hours.
Studies the animals, plants, and ecosystems of the new world tropics, with an emphasis on the latest techniques employed by coral molecular biologists and physiologists.

EEMB 5508. Marine Birds and Mammals. 2 Hours.
Studies principles of classification, anatomy, physiology, behavior, and evolution of seabirds and marine mammals. Also addresses conservation and protection of animals and essential habitat. Includes field trips to observe local species.

EEMB 5509. Lab for EEMB 5508. 1 Hour.
Accompanies EEMB 5508. Covers topics from the course through various experiments.

EEMB 5511. Adaptations of Aquatic Organisms. 3 Hours.
Explores the adaptive responses of marine organisms to variations in environmental factors. Focuses on physiological responses to a variety of natural and anthropogenic conditions. The laboratory component includes a combination of field and laboratory experiments.

EEMB 5512. Tropical Terrestrial Ecology. 1 Hour.
Studies the animals, plants, and ecosystems of the new world tropics, with the community structure and diversity of terrestrial Jamaican habitats as an example. Includes field trips to lowland forests, carbonate caves, and the Blue Mountain mist-montane forest. The issue of land use and development vs. conservation is a recurring theme.

EEMB 5514. Marine Ecology. 4 Hours.
Examines processes and interactions in ocean ecosystems. Topics include an introduction to major ocean ecosystems; the biotic and abiotic factors influencing the distributions, abundances, and interactions of marine organisms; and the transformation and flux of energy and matter in marine systems. Particularly emphasizes local coastal habitats, which are used to demonstrate quantitative field research methods.
EEMB 5515. Lab for EEMB 5514. 1 Hour.
Accompanies EEMB 5514. Covers topics from the course through various experiments.

EEMB 5516. Oceanography. 4 Hours.
Offers an integrated overview of physical, chemical, biological, and geological processes operating in the world ocean. Seemingly unrelated topics like plate tectonics, oscillating currents and waves in the atmosphere, the activities of microbes and phytoplankton, and land-use practices in the middle of the continent have global reach and interact with each other in surprising yet understandable ways. Examines how new technologies have allowed stunning insights into global weather and climate, the deep sea, biodiversity, and how the biogeochemistry of the oceans can be measured and understood. Presents data use and analysis and formal reasoning used in marine science. Views the ocean as a “system of systems” where integration of experience from disparate disciplines is key.

EEMB 5517. Lab for EEMB 5516. 1 Hour.
Accompanies EEMB 5516. Offers experiential field and laboratory exercises in oceanography. The New England rocky intertidal, subtidal, wetlands, barrier islands, and dunes provide opportunities for field exercises in marine geology, physical oceanography, and marine ecology. Investigates processes affecting changes in the global ocean, such as ocean acidification; temperature stress in organisms; hydrodynamic drag and lift; suspension feeding; and the ecophysiology of reef corals, boreal invertebrates, and macroalgae.

EEMB 5518. Ocean and Coastal Processes. 2 Hours.
Examines the coupling between physical and biological processes on coral reefs and adjacent habitats. Focuses on biophysical, oceanographic, and benthic-pelagic processes acting in coral reef and associated nearshore ecosystems. Specific topics include oceanographic forcing mechanisms, organismal biomechanics, hydrodynamics, and nutrient dynamics.

EEMB 5520. Coral Reef Ecology. 2 Hours.
Examines the ecology and paleoecology of coral reefs. This course highlights the ecological importance of coral reefs and associated nearshore communities, ecosystem function, changes in reef biotas through geologic time, and the causes and consequences of reef degradation worldwide.

EEMB 5522. Experimental Design Marine Ecology. 4 Hours.
Includes introduction to and application of observational methods in three local marine habitats, experimental design, statistical analysis, R statistical computing and graphics software, and principles of marine ecology. Combines lecture, hand-on research experience, and computer laboratory and includes reading and analyzing the scientific literature and developing research projects. At the end of the semester, students are expected to demonstrate an integrative mastery of course topics by writing a scientific manuscript about a class experiment. Seeks to prepare students for practicing ecology in new environments and to provide students with the foundational knowledge necessary for pursuing more complex concepts in experimental design, statistical analysis, and marine ecology.

EEMB 5523. Lab for EEMB 5522. 1 Hour.
Accompanies EEMB 5522. Covers topics from the course through various experiments.

EEMB 5524. Molecular Marine Biology. 3 Hours.
Uses molecular approaches (electrophoresis and DNA) to determine genetic relationships at the population and species level for the study of ecological and evolutionary questions. Techniques learned are applied to research projects.

EEMB 5525. Marine Microbial Ecology. 3 Hours.
Examines the diversity of marine microorganisms and recent advances in the area of microbial ecology. Emphasizes the structure and function of microbial food webs in marine communities.

EEMB 5527. Lab for EEMB 5526. 1 Hour.
Accompanies EEMB 5526. Covers topics from the course through various experiments.

EEMB 5528. Marine Conservation Biology. 3 Hours.
Examines several critical issues facing marine ecosystems, including invasive species, marine pollution and eutrophication, fisheries impacts, physical alteration of habitats, and global climate change. Offers students an opportunity to spend field time surveying intertidal and subtidal habitats within the San Juan Islands and Friday Harbor Marine Reserve and to conduct independent research projects.

EEMB 5530. Molecular Ecology and Evolution. 4 Hours.
Exposes students to the molecular techniques and analyses used to examine the genetic relationships among individuals, populations, and species.

EEMB 5531. Lab for EEMB 5530. 1 Hour.
Accompanies EEMB 5530. Covers topics from the course through various experiments.

EEMB 5532. Physiological and Molecular Marine Ecology. 3 Hours.
Explores the physiological responses of marine organisms to variations in environmental factors. Uses complementary techniques, including molecular and physiological approaches, to determine genetic relationships at the species and population level and elucidate the mechanistic basis of organismic responses to environmental conditions at the level of genes and gene products.

EEMB 5534. Marine Invertebrate Zoology and Botany. 4 Hours.
Surveys the major groups of marine invertebrates, algae, and plants, in addition to their ecological roles and relationships. Offers students an opportunity to learn to identify these groups and understand the mechanisms they use to survive and adapt to changing oceans. Topics include ecological and evolutionary importance, ecosystem engineering, adaptive physiology, and climate change effects. Emphasizes interrelationships among major taxa. Hands-on learning includes field identification; visits to intertidal and subtidal marine environments; and specimen dissection, preparation, and cataloging. Offers students an opportunity to improve skills in reading and discussing scientific literature, experimental design, and scientific communication. Restricted to Three Seas students only; not open to students who have taken EEMB 5500 or EEMB 5502.

EEMB 5535. Lab for EEMB 5534. 1 Hour.
Accompanies EEMB 5534. Covers topics from the course through various experiments.

EEMB 5536. Ocean and Coastal Sustainability. 3 Hours.
Offers students advanced training in the expanding field of sustainability, with a combined focus on the practical aspects of systems management and the theoretical understanding of whole-systems design and resiliency. Seeks to train future leaders capable of creating innovative solutions to sustainability issues at local and global levels. Key interdisciplinary themes discussed include the social and political aspects of ocean and coastal sustainability (i.e., education and communication), sustainable development and ecosystem stability, the impacts of climate change on ocean and coastal resilience, and the economic and entrepreneurial possibilities in the field of sustainability. Restricted to Three Seas students only.
EEMB 5548. Sociobiology. 4 Hours.
Studies sociobiology, a field of biology that strives to understand the biological basis of social behavior in animals. Sociobiology is a multidisciplinary science, meshing together ethology (animal behavior), ecology, genetics, population biology, and comparative psychology, all within the conceptual framework of evolutionary theory. Why do animals live in societies? Why do animals cooperate? Why do they sometimes show extreme forms of altruism? What are the costs and benefits of group living? Reviews studies on nonhuman animals that demonstrate sociobiological principles by using a series of in-class activities, computer modeling assignments, interpretation of graphical and tabulated data, collection and statistical analyses of behavioral data, as well as the generation and presentation of research.

EEMB 5560. Entomology. 4 Hours.
Studies the biology of insects and related arthropods including their anatomy, morphology, physiology, development, taxonomy, ecology, behavior, and life histories. Includes field and laboratory study of insect biology.

EEMB 5561. Lab for EEMB 5560. 1 Hour.
Accompanies EEMB 5560. Covers topics from the course through field and laboratory study, including insect collection.

EEMB 5562. Herpetology. 4 Hours.
Offers a survey of the amphibians and reptiles of the world, with emphasis on eastern North America. Topics include morphology, physiology, systematics, paleontology, ecology, zoogeography, and behavior. Includes field trips to observe the habitats and behavior of local herpetofauna. Laboratory emphasizes systematics and ecology.

EEMB 5563. Lab for EEMB 5562. 1 Hour.
Accompanies EEMB 5562. Covers topics from the course through various experiments.

EEMB 5564. Ornithology. 4 Hours.
Offers a survey of the birds of the world including morphology, physiology, systematics, behavior, ecology, zoogeography, and paleontology. Laboratory focuses on the identification and ecology of the avifauna of the Northeast, with field trips in eastern Massachusetts.

EEMB 5565. Lab for EEMB 5564. 1 Hour.
Accompanies EEMB 5564. Covers topics from the course through various experiments.

EEMB 5566. Wildlife Biology. 4 Hours.
Presents concepts and techniques utilized in the conservation and study of wild animals including the sociological aspects of management. Topics include habitat management, nonnative species, zoonoses, endangered species, legislation, and financing. Includes extended field trips to observe various ecosystems and wildlife.

EEMB 5569. Lab for EEMB 5568. 1 Hour.
Accompanies EEMB 5568. Covers topics from the course through various experiments.

EEMB 5589. Diving Research Methods. 2 Hours.
Presents experimental design, sampling methodology, statistical analysis, techniques, and the use of underwater equipment to conduct subtidal research.

Presents key concepts and important recent advances in evolution and ecology, including interdisciplinary approaches to understanding the distributions, abundances, and diversity of species, organisms, and molecules. Topics include natural selection, adaptation, speciation, molecular evolution, global change, and perspectives on communities and ecosystems. Discusses and critiques current literature and methods.

ECON 1000. Economics at Northeastern. 1 Hour.
Intended for freshmen in the College of Social Sciences and Humanities. Introduces freshmen to the liberal arts in general; familiarizes them with their major; helps them develop the academic skills necessary to succeed (analytical ability and critical thinking); provides grounding in the culture and values of the University community; and helps them develop interpersonal skills—in short, familiarizes students with all skills needed to become a successful university student.

ECON 1101. Economic Problems and Perspectives. 4 Hours.
Studies the economic concepts and methods that are useful to an informed citizen for an understanding of modern social issues such as unemployment, inflation, poverty, crime, the environment, medical care, and international competitiveness. Not recommended for students who have completed either ECON 1115 or ECON 1116.
ECON 1115. Principles of Macroeconomics. 4 Hours.
Introduces macroeconomic analysis. Topics include the flow of national income, economics growth and fluctuation, the role of money and banking, and monetary and fiscal policies. Emphasizes the development of conceptual tools to analyze the economic problems facing modern society.

ECON 1116. Principles of Microeconomics. 4 Hours.
Focuses on development of basic theory of demand, supply, and market price. Explores applications to selected microeconomic problems, such as basic monopoly and competition, and other issues that relate to the role of the pricing system in resource allocation and income distribution.

ECON 1120. Learning Economics through Games. 4 Hours.
Introduces students with little or no background in economics to methods of economic analysis and some of the topics that economists study. Many games have economic themes, and even the ones that do not often have aspects that can be analyzed using the methods of economics. Covers concepts such as marginal analysis, game theory, and sources of growth through the play and analysis of board and computer games. Explores topics in economic history in this context as well. Note: This course does not count toward economics major or minor elective requirements.

ECON 1121. Lab for ECON 1120. 4 Hours.
Accompanies ECON 1120. Covers course topics through experimentation with games. Note: This course does not count toward economics major or minor elective requirements.

ECON 1125. Recitation for ECON 1115. 0 Hours.
Provides small-group discussion format to cover material in ECON 1115.

ECON 1126. Recitation for ECON 1116. 0 Hours.
Offers small-group discussion format to cover material in ECON 1116.

ECON 1230. Healthcare and Medical Economics. 4 Hours.
Enables students to recognize the relevance of economics to health and medical care and apply economic reasoning to understand health-related issues better; to understand the mechanism of healthcare delivery in the United States within broad social, political, and economic contexts; to explore the changing nature of health and medical care and its implications for medical practice, medical education and research, and health policy; and to analyze public policy in health and medical care from an economic perspective.

ECON 1240. Economics of Crime. 4 Hours.
Covers economic analysis of crime and the criminal justice system. Topics include theoretical and empirical analysis of the economic causes of criminal behavior, the social costs of crime and its prevention, and the design of enforcement policies.

ECON 1250. Game Theory in the Social Sciences. 4 Hours.
Introduces modern game theory. Games describe individuals’ actions and offer tools for understanding and predicting how rational players will make choices, given their preferences, information, and available actions. The course considers games in which players know the payoffs and preferences but may have imperfect information about actions. Covers tools for predicting behavior, including iterative dominance, rationalizability, Nash equilibrium, backward induction, and subgame perfection. Introduces games of asymmetric information in which players do not know each others’ payoffs and preferences. The tools are applied to a range of fields in economics (industrial organization, labor, public finance, insurance, auctions, bargaining, and macroeconomics); business (incentive design, organizational design, pricing, product-line decisions, marketing); political science; sociology; and law.

ECON 1260. Contested Issues in the U.S. Economy. 4 Hours.
Covers many of the contested economic issues that the United States faces as a nation—the size of government, the national debt, the war on drugs, national healthcare, taxation, and many more. An important social system in any society is the economic system—the allocation of scarce resources. In the large and complex economy of the United States, there is controversy over what goods and services are produced and how they are distributed. To understand the nature and causes of these issues requires a course where theory is a tool of analysis, not the focus. Economics is not value free. Attention is given to the role of ethics and how our moral values shape policy. Course topics vary from semester to semester.

ECON 1270. Economic Status of Ethnic Minorities. 4 Hours.
Examines the economic conditions and processes as they impact minorities within the U.S. economy. Considers the role of national economic policies undertaken to address general economic and social conditions, as well as policies targeted at minority markets and institutions. Emphasis is on empirical analysis; historical and cultural materials may be incorporated.

ECON 1281. Economics of the Creative Industries. 4 Hours.
 Presents an overview of the economic aspects of creative industries. Examines the production and consumption of creative goods and services. Topics include consumer demand, economic models of nonprofit and for-profit production of creative goods, competition and market structure, artists and other creative workers as members of the labor force, productivity issues in the performing arts, government support for the creative sector, and the role and impact of public and private subsidies.

ECON 1290. History of the Global Economy. 4 Hours.
Covers ideological biases in economics; the extent of global disparities around 1800; evolution of global disparities since 1800; evolution of international integration and international trading and monetary regimes, 1800–2000; theories explaining global disparities: classical, neoclassical, Marxist, neo-Marxian, and structuralist; import-substituting industrialization: Latin America, Asia, and Africa; international debt crises: nineteenth and twentieth centuries; the new global regime; structural adjustment: GATT (General Agreement on Tariffs and Trade) and WTO (World Trade Organization); and socialist interlude: a socialist experience and transition to capitalism.

ECON 1291. Development Economics. 4 Hours.
Covers ideological biases in economics; origins of the Industrial Revolution; the evolution of global disparities, and how markets, imperialism, and racism affected this process; theories of growth: neoclassical, institutional; growth and structural change; growth and demographic change; growth, income distribution, and welfare; development policies: import-substitution vs. outward-orientation; growth based on primary exports and the socialist experience and transition to capitalism.

ECON 1292. Economic History of the Middle East. 4 Hours.
Provides an historical account of the economies of the Middle East from the sixth century C.E. to the present. Conceived of the area between the Nile and Oxus as forming the core of the Middle East; besides the core, the region includes Turkey and North Africa. Identifies the major economic and demographic trends in the region, or segments of the region, to examine the ecological bases of the economies and the connection between political history and the economic trends and to understand the ways in which economies of the region articulated with other major economic regions including Europe, West Africa, and the economies of the Indian Ocean. Studies the systems of government and laws, agriculture, commerce, and manufacturing.
ECON 1293. European Economic History. 4 Hours.
Covers European economic history from ancient times to the twentieth century. A brief survey of early Greek and Roman economic life provides the context for more in-depth analysis of medieval, mercantilist, and modern economic institutions. Emphasis is on the role of technology, trade, and natural resources in the development of modern European economies.

ECON 1915. Introductory Selected Topics in Macroeconomics. 4 Hours.
Covers selected topic matter in the field of macroeconomics. The specific topic is chosen by the instructor. May be repeated up to three times.

ECON 1916. Introductory Selected Topics in Microeconomics. 4 Hours.
Covers selected topic matter in the field of microeconomics. The specific topic is chosen by the instructor. May be repeated up to three times.

ECON 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ECON 2315. Macroeconomic Theory. 4 Hours.
Presents several theoretical approaches to the study of short-run economic instability and long-run growth. Uses conceptual and mathematical tools to examine what economists believe to be the major determinants of fluctuations in employment and price level, as well as the rate of economic growth. The theoretical models are used to evaluate the operation and impact of various macroeconomic policy tools.

ECON 2316. Microeconomic Theory. 4 Hours.
Examines supply-and-demand analysis, various elasticity concepts and applications, theories of demand and production, and derivation of cost curves. Analyzes pricing and output behavior in the several market structures with their welfare and the pricing of resources.

ECON 2325. Recitation for ECON 2315. 0 Hours.
Offers small-group discussion format to cover material in ECON 2315.

ECON 2326. Recitation for ECON 2316. 0 Hours.
Offers small-group discussion format to cover material in ECON 2316.

ECON 2350. Statistics. 4 Hours.
Discusses basic probability, descriptive statistics, estimation techniques, statistical hypotheses, sampling, analysis of variance, correlation, and regression analysis in the context of economics. Computer applications are an integral part of the course.

ECON 2560. Applied Econometrics. 4 Hours.
Examines research methods used by practicing economists. Discusses typical problems from applied areas of economics including choice of modeling framework, problems of data collection, review of estimation techniques, interpretation of results, and development of static and dynamic adaptive policy models. A research paper utilizing computer applications is an integral part of the course.

ECON 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ECON 3404. International Food Economics and Policy. 4 Hours.
Covers basic concepts in economic and political dimensions of food production, consumption, and trade, with particular emphasis on the global food system. Topics include market and consumption analysis, the agriculture and food industries, types of food policy and other political instruments related to food, and how these affect consumer food choices, environment, diet, nutrition, and health. Discusses and analyzes factors driving the rapid evolution of the way food is produced, processed, distributed, and consumed, and its implications, in the context of the global food environment. Reviews current empirical evidence on the world food situation and discusses issues such as hunger, food security, obesity, and food safety.

ECON 3405. A Critique of Capitalism. 4 Hours.
Examines the origins, workings, successes, and failures of capitalism, defined as an economic system where capital is mostly privately owned and markets generally solve economic problems. Examines, in addition, several variants of private-ownership economies including slavery, feudalism, land-tenancy, putting-out system, and self-employment. Also examines some alternatives to capitalism, such as command socialism, market socialism, worker-ownership of capital, cooperatives, Islamic economy, and Christian economy.

ECON 3406. Critical Perspectives on Economics. 4 Hours.
Examines the assumptions, concepts, theories, tools, and tests employed by neoclassical economics; identifies the biases and limits of these methods; and explores alternative economic approaches that might overcome these failings. Also develops an ethical critique of markets, the profit motive, corporations, efficiency, innovation, and economic growth. Offers students an opportunity to develop critical perspectives on neoclassical economics and other approaches to economics.

ECON 3410. Labor Economics. 4 Hours.
Explores the labor market, the labor force, and wages and earnings. Explores the differences that have existed and currently exist in the labor market with regard to race, ethnicity, and gender and the theories behind why they have existed and continue to exist. Covers supply, development, and efficient use of human resources; demand for labor by businesses and industries; wage inequality and its determinants; changing occupational and industrial structure; nature, causes, and incidence of unemployment; economic impact of unions; and influence of related labor-market institutions and relevant public policies including minimum wages, wage subsidies, and earned-income tax credits, health and safety regulations (OSHA); and antidiscrimination and affirmative action policies and programs.

ECON 3414. Economics of Human Capital. 4 Hours.
Explores theoretical and empirical treatment of economic issues related to investments in human capital including formal education (preschool through postsecondary), vocational education, on-the-job training, work experience and government-sponsored employment and training programs, and their impacts on individuals and society. Emphasizes studies of public policies to promote human capital investments including cost-effectiveness analysis and benefit-cost analysis for determining the effectiveness of investments in literacy, education, and training from a private and social standpoint.

ECON 3415. Poverty and Income. 4 Hours.
Focuses on economic analysis of inequalities in incomes, earnings, and wealth; poverty; and discrimination. Examines the causes of economic inequality and the nature, causes, and effects of poverty; explores an array of public policies to reduce poverty and inequalities in income, earnings, and wealth.

ECON 3420. Urban Economic Issues. 4 Hours.
Studies urban growth and development, focusing on economic analysis of selected urban problems such as housing, poverty, transportation, education, health, crime, and the urban environment. Discusses public policies related to such problems.

ECON 3422. Economics of Transportation. 4 Hours.
Covers transportation and land-use patterns; externalities; special costs and social benefits of various modes of transportation, ownership, regulations, and financing of various modes of transportation; and economics of new technology in transportation.
ECON 3423. Environmental Economics. 4 Hours.
Applies the tools of economics to environmental issues. Explores
taxonomy of environmental effects; externalities; the commons problem;
taxation, regulations, marketable permits, and property rights as a
solution; measuring benefits of cleaner air and water, noise abatement,
and recreational areas; global issues including tropical deforestation
and acid rain; and the relevance of economics to the environmental debate.

ECON 3424. Law and Economics. 4 Hours.
Focuses on how an understanding of the law is furthered by an
awareness of the economic background against which it operates.
Draws from economic principles, developing concepts such as efficiency,
property rights, regulation, and income distribution. Uses mathematical
notation to model the incentives created by various legal rules. Solutions
to cost minimization and utility maximization problems reveal whether
particular laws induce economic agents to act in a manner consistent
with the social optimum. Applications of these ideas may include health
and safety, the environment, the legal services and insurance industries,
and zoning and land use, among others.

ECON 3425. Energy Economics. 4 Hours.
Introduces theoretical and empirical perspectives on energy demand
and energy supply. Energy is vital to modern economies. Emphasizes the
role markets play in determining how to use energy and its sources and
the scope for public policy to address market imperfections. Discusses
oil, natural gas, coal, nuclear power, and renewable energy (such as
hydro-, wind, and solar power). Covers the public policy issues around
greenhouse gas emissions and energy security.

ECON 3440. Public Finance. 4 Hours.
Presents an overview of the economics of government and the role of
public policy. Develops guidelines to determine which economic activities
are best performed by government and which are not. Also examines the
impact of tax policies on efficiency, economic growth, and equity.
Topics include market failures, public choice, the personal income tax, the
corporate tax, sales tax, and taxation of capital and wealth, and options
for reform of the tax structure. Major spending programs such as social
security and education and healthcare are analyzed.

ECON 3442. Money and Banking. 4 Hours.
Covers the nature and functions of money, credit, and financial markets
in the modern international economy. Analyzes financial markets and
institutions, central banking, and the effects of interest and foreign
exchange rates on the real economy.

ECON 3460. Managerial Economics. 4 Hours.
Explores the application of economic principles to the solution of
managerial decision-making problems in areas such as demand
estimation, cost estimation and control, pricing and marketing strategies,
employee incentives, financing of capital investments, and responses to
government regulation and taxation. Case studies and simulation models
are typically used as pedagogical tools.

ECON 3461. Government and Business. 4 Hours.
Examines the government’s role in regulating economic activity.
Discusses factors behind the trends of market deregulation and
increasing social regulation. Develops criteria to determine when
regulation and antitrust law is desirable. Topics include antitrust laws
and their enforcement; regulation of public utilities, transportation, and
communication industries; and regulation of environmental, health,
product, and workplace safety.

ECON 3462. Bubbles, Busts, and Bailouts: Market and Regulatory Failures in the Financial Crisis. 4 Hours.
Investigates economic and financial bubbles together with the busts
and bailouts that usually follow. Analyzes how and why bubbles form in
markets such as housing and stocks, emphasizing the financial crisis of
2007–2008 but covers others as well. Also examines the lasting effects
on markets and the economy from the collapse of such bubbles and the
need for bailouts and other policies that are often used. Applies a range
of perspectives to identify the market failures and regulatory failures
that can cause bubbles—failures of assumptions about information,
about incentives, and about oversight. Includes perspectives from
microeconomics, behavioral economics, finance, and public policy.

ECON 3470. American Economic History. 4 Hours.
Covers the economic history of the United States from the colonial period
to the present. Includes studies of the development of major economic
institutions and the effects of technological change. Examines economic
reasons for the spread of an industrial market economy in the nineteenth
century and the successes and failures of this economy in the twentieth
century.

ECON 3481. Economics of Sports. 4 Hours.
Investigates what economics has to say about sports as an economic
activity: what tools of economic analysis apply to sports, whether sports
require different economic tools, what the evidence has to say about
key questions. Focuses on professional team sports, although some
attention is paid to college sports and to individual professional sports.

ECON 3490. Public Choice Economics. 4 Hours.
Studies public choice economics—the scientific analysis of government
behavior—and is divided into two parts: institutional political economy
and social choice theory. Public choice economics applies this
neoclassical economic analysis to political issues such as rent seeking,
tax reform, logrolling, voting behavior, the function of government, the
intersection between public and private interests, and federalism. The
point of departure from political science is that economists have based
this analysis on the assumption that utility functions do not change once
a person enters the realm of public service and that the argument of their
utility functions is still their own self-interest and not the interest of the
social system in which they operate.

ECON 3520. History of Economic Thought. 4 Hours.
Traces the evolution of Western economic thought. Covers several
important periods and schools of economic thought including
mercantilism, physiocracy, classical, Marxist, neoclassical, and
Keynesian. Emphasizes the relationship between historical changes
in society and economic thought, focusing on changes in the types of
questions economists ask and the analytical tools they use.

ECON 3915. Intermediate Selected Topics in Macroeconomics. 4 Hours.
Covers selected topic matter in the field of macroeconomics. The specific
topic is chosen by the instructor. May be repeated up to five times.

ECON 3916. Intermediate Selected Topics in Microeconomics. 4 Hours.
Covers selected topic matter in the field of microeconomics. The specific
topic is chosen by the instructor. May be repeated up to five times.

ECON 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions.
May be repeated without limit.
ECON 4634. Comparative Economics. 4 Hours.
Describes the uniqueness of modern market economies in terms of social institutions that serve limited economic ends. Begins with a presentation of traditional economic analyses of the advantages and disadvantages of market economies. Examines these theories in light of evidence from economic anthropology regarding the evolution of market institutions and from the problems encountered in contemporary transitional economies as they move from command to market institutions.

ECON 4635. International Economics. 4 Hours.
Covers Ricardian and neoclassical theories of trade; trade policies; tariffs, quotas, voluntary export restraints, and customs union; global trade regime; GATT (General Agreement on Tariffs and Trade) and WTO (World Trade Organization); balance-of-payments accounts; foreign exchange markets; monetary and portfolio balance approaches to external balance; fixed or flexible exchange rates; and international monetary system.

ECON 4640. Financial Economics. 4 Hours.
Introduces students to the theory of investments, including the principles of risk and return, the theory of portfolio selection, asset pricing models such as the capital asset pricing model (CAPM) and arbitrage pricing theory (APT), valuation of stocks, bond pricing and the term structure of interest rates, and options (what they are and how to use them). Geared toward nonbusiness majors who are interested in a rigorous course in finance.

ECON 4650. Economic Growth and Applications. 4 Hours.
Explores the theory as well as the empirics of economic growth. Emphasizes international comparisons of economic performance in terms of aggregate income and long-run growth. Presents the neoclassical model of economic growth as well as endogenous growth theory. Covers econometric application of the growth models. Topics include the role of ideas and technology, population dynamics, government policy, culture, the environment, income inequality, international trade, democracy, international aid, foreign investment, and the rule of law. One of the purposes of this class is to allow economics majors to apply and extend their knowledge of macroeconomic theory and applied econometrics.

ECON 4653. Mathematics for Economics. 4 Hours.
Introduces basic tools of mathematics, matrix algebra, differential and integral calculus, and classical optimization, with special reference to economic applications. Computer applications are an integral part of the course.

ECON 4680. Competition Policy and Regulation. 4 Hours.
Presents an analytic framework and empirical study of how the structure of industries and the conduct of sellers affect performance. Includes examples and case studies from both the "old economy" and the "new economy." Examines antitrust as a public policy designed to promote better market performance.

ECON 4681. Information Economics and Game Theory. 4 Hours.
Offers an advanced course on the economics of information, including moral hazard and adverse selection; game theory; and mechanism design. Formally considers alternative solution concepts, such as Nash equilibrium and rationalizability for simultaneous move and sequential move games under complete information about payoffs and preferences, as well as solution concepts, such as Bayesian-Nash equilibrium to analyze selection, screening, and incentives in games of incomplete or asymmetric information. Covers optimal incentives or mechanism design, including the optimal design of contracts, auctions, and other mechanisms. Prior exposure to game theory recommended.

ECON 4692. Senior Economics Seminar. 4 Hours.
Incorporates aspects of real-world and academic experiences of students into an analytical context, enabling students to demonstrate their ability to apply economic concepts, methodology, and data to economic issues and problems of personal and philosophical significance.

ECON 4915. Advanced Selected Topics in Macroeconomics. 4 Hours.
Covers selected topic matter in the field of macroeconomics. The specific topic is chosen by the instructor. May be repeated without limit.

ECON 4916. Advanced Selected Topics in Microeconomics. 4 Hours.
Covers selected topic matter in the field of microeconomics. The specific topic is chosen by the instructor. May be repeated without limit.

ECON 4965. Undergraduate Teaching Experience 1. 4 Hours.
Offers an opportunity for qualified undergraduate students to serve as undergraduate teaching assistants. Requires various assignments closely directed by the assigned course instructor. These may include holding office hours, light grading, maintaining the records for the course, proctoring—but not solely administering—exams and quizzes, holding recitation/tutorial sessions, and (very) limited lecturing or leading class discussions. Requires minimum overall GPA of 3.333 and grade of A– or better in course assignment; permission to enroll is further subject to the availability of an appropriate course assignment and instructor.

ECON 4966. Undergraduate Teaching Experience 2. 1 Hour.
Offers an opportunity for qualified undergraduate students to serve as undergraduate teaching assistants. Requires various assignments closely directed by the assigned course instructor. These may include holding office hours, light grading, maintaining the records for the course, proctoring—but not solely administering—exams and quizzes, holding recitation/tutorial sessions, and (very) limited lecturing or leading class discussions. May incur a one-credit overload charge. Requires minimum overall GPA of 3.333 and grade of A– or better in course assignment; permission to enroll is further subject to the availability of an appropriate course assignment and instructor.

ECON 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

ECON 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ECON 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ECON 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

ECON 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May not be substituted for requirements leading to a BA or BS in economics. Requires approval of department chair. May be repeated without limit.

ECON 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ECON 4994. Internship. 4 Hours.
Offers students an opportunity for internship work. May be repeated without limit.
ECON 2263. Intermediate Microeconomic Theory. 3 Hours.
Requires knowledge of undergraduate microeconomic theory.

ECON 2264. Intermediate Macroeconomic Theory. 3 Hours.
Examines theories of the short-run determination of output, employment, and prices, and long-run economic growth. Presents alternative macroeconomic models. Also consists of applied case study analysis of the theoretical models presented in class. Requires knowledge of undergraduate microeconomic theory.

ECON 5140. Applied Econometrics. 4 Hours.
Offers an intensive study of econometric techniques applied to cross-section, time-series, and panel data. Applies the fundamentals of econometrics to analyzing structural economic models, forecasting, and policy analysis. Computer applications and an empirical research project are an integral part of the course.

ECON 5291. Applied Development. 4 Hours.
Focuses on major macroeconomic policy questions for developing countries in an open economy context. Combines theoretical foundations with institutional analysis and empirical evidence. Begins by developing a macroeconomic framework to analyze short-term macroeconomic adjustment and concludes with long-term growth, emphasizing the effects of financial integration and capital account regulations on macroeconomic performance in developing countries. Approaches macroeconomic policy issues from a political economy perspective on macroeconomics. Empirical data and country experiences help assess the validity of theoretical propositions and explain the complexity of development trajectories. Requires previous course work in macroeconomic theory.

ECON 5292. Gender and Development Economics. 4 Hours.
Examines topics at the intersection of women’s empowerment and economic development from an economic perspective. Introduces potential explanations for the gender inequalities in the context of developing countries as well as the role of public policy in addressing such disparities. Studies microeconomics topics such as education gaps, fertility, family planning, HIV/AIDS, marriage dynamics and intrahousehold allocation of resources, female labor outcomes and migration, as well as conflict and domestic violence. Offers students an opportunity to apply basic economic theory associated with each topic as well as the research methodologies used in recent empirical papers. Students with an econometrics background have a better understanding of the empirical papers. Requires previous course work in microeconomic theory and in statistics.

ECON 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May not be substituted for requirements leading to a BA or BS in economics. May be repeated without limit.

ECON 5984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

ECON 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ECON 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

ECON 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

ECON 7200. Topics in Applied Economics. 4 Hours.
Presents an application of microeconomic and macroeconomic theory, as well as quantitative methods, to a variety of social issues, both domestic and international. May be repeated without limit.

ECON 7210. Applied Microeconomic Policy Analysis. 4 Hours.
Examines the range of macroeconomic activities undertaken by national governments around the world, and identifies the role of a diverse array of macroeconomic policymaking and planning tools and techniques for use in formulating and evaluating macroeconomic policies. Topics include the macroeconomic functions of government, alternative macroeconomic policies and policy tools, the theory of economic policy, macroeconomic accounting and databases, econometric models of national economies, policy simulation models, forecasting and projection models, input-output models, general equilibrium models, and national economic growth models including the new growth models and empirical applications. ECON 5140 is recommended as a previous course.

ECON 7220. Applied Macroeconomic Policy Analysis. 4 Hours.
Examines the range of macroeconomic activities undertaken by national governments around the world, and identifies the role of a diverse array of macroeconomic policymaking and planning tools and techniques for use in formulating and evaluating macroeconomic policies. Topics include the macroeconomic functions of government, alternative macroeconomic policies and policy tools, the theory of economic policy, macroeconomic accounting and databases, econometric models of national economies, policy simulation models, forecasting and projection models, input-output models, general equilibrium models, and national economic growth models including the new growth models and empirical applications. ECON 5140 is recommended.

ECON 7230. History of Economic Thought. 4 Hours.
Examines the range of macroeconomic activities undertaken by national governments around the world, and identifies the role of a diverse array of macroeconomic policymaking and planning tools and techniques for use in formulating and evaluating macroeconomic policies. Topics include the macroeconomic functions of government, alternative macroeconomic policies and policy tools, the theory of economic policy, macroeconomic accounting and databases, econometric models of national economies, policy simulation models, forecasting and projection models, input-output models, general equilibrium models, and national economic growth models including the new growth models and empirical applications. ECON 5140 is recommended.

ECON 7240. Workshop in Applied Econometrics. 4 Hours.
Offers an intensive, hands-on application of econometrics to research problems in economics, using current econometric software packages. Both cross-section and time-series techniques are used and applied to different areas of economics, such as global economics, labor economics, urban economics, public finance, policy evaluation, and so on. Students are expected to complete a written applied econometrics project and present the results to the class.
ECON 7250. International Economic Development. 4 Hours.
Examines the record of growth and development over the past five centuries, the history of global disparities in levels of development over the past two centuries, theories of growth and development, and development policies across lagging countries over the past fifty years. Each topic is examined from different theoretical perspectives including Marxist, neo-Marxist, neoclassical, and institutional. Familiarity with microeconomics and trade theory is recommended.

ECON 7251. International Finance. 4 Hours.
Introduces students to international finance and equips them with tools and methods to study and analyze international economic issues and problems. Topics include the foreign exchange market, balance of payments, international investment and banking, monetary and fiscal policy in an open economy, economic integration and monetary unification, the international monetary system, and optimum currency areas. Each student is required to write a short paper on a current problem in international finance.

ECON 7252. International Trade. 4 Hours.
Examines theories of trade including Ricardian, Heckscher-Ohlin, and trade theory under increasing returns to scale; welfare implications of different trade policies including tariffs, quotas, voluntary export restraints, and customs union; the political economy of trade policies; and global trading arrangements including GATT and WTO. Requires knowledge of microeconomic theory.

ECON 7253. International Integration. 4 Hours.
Examines the evolution of global markets for goods, services, capital, and labor over the past two centuries, the stylized facts regarding trends in integration, the factors affecting the trends in integration, the linkages between integration of different markets, and the impact of integration on the dynamics of global development and disparities. The analysis follows an eclectic approach to the questions addressed, drawing upon different intellectual traditions in economics. Requires knowledge of intermediate microeconomic theory.

ECON 7260. Urban Economic Systems. 4 Hours.
Examines urban economic systems including systematic relationships among cities, as well as those within cities. The portion of the course devoted to intermetropolitan analysis covers central place theory, the location of economic activity, and intermetropolitan trade. Intrametropolitan analysis includes urban form and land use, land use controls, and local government systems.

ECON 7261. Urban Economic Development. 4 Hours.
Examines urban economic development processes. Topics include models and techniques for describing and evaluating urban economies; development strategies and tools; commercial, industrial, and housing development; and problems of poverty and housing.

ECON 7262. Regional Economic Theory. 4 Hours.
Analyzes the following topics: comparative costs and location analysis for industry, various indices of location measures, land use theories, interregional labor migration, interregional trade, regional development, regional equilibrium analysis, regional and interregional input-output analysis, and econometric models for regional analysis.

ECON 7263. Labor Economics. 4 Hours.
Offers a comprehensive microeconomic approach to neoclassical wage theory and the theory of labor markets focusing on labor supply, household production, marginal productivity, human capital, and search. Examines alternative labor market theories including the efficiency wage theory and the dual labor market theory. Emphasis is on understanding and estimating empirical models of labor markets.

ECON 7264. Economics of Human Capital. 4 Hours.
Studies human capital theory and its applications to a wide variety of economic and social behaviors including fertility, labor supply behavior, migration, employment and unemployment rates, wages, earnings, health, and economic growth and development. Topics include the evolution of human capital theory, concepts and measures, and the contributions of human capital to the economic growth of nations and regions. Applications cover the United States, other industrialized nations, and developing countries.

ECON 7265. Inequality and Poverty. 4 Hours.
Covers an array of topics on the economics of inequality and its application to the distribution of wages, earnings, incomes, and wealth and the economics of poverty. Topics include an analysis of the distribution of economic rewards in societies and alternative mechanisms for distributing incomes and goods/services; alternative concepts and measures of economic inequality; theories of distributive justice; empirical studies of wage, earnings, income, and wealth inequality; the measurement and analysis of poverty problems; and public policies to combat inequality and poverty. Presents empirical studies of inequality and poverty problems in the United States, other industrialized countries, and developing nations.

ECON 7266. Economics of Government. 4 Hours.
Presents an overview of the economics of government and the role of public policy. Develops guidelines to determine which economic activities are best performed by government and which are not. Topics include public choice, public goods, externalities, public enterprise, and efficiency and equity effects of alternative tax systems.

ECON 7270. Economics of Law and Regulation. 4 Hours.
Relies on models of welfare economics to analyze the impact of laws, regulation, and deregulation, in terms of both positive and normative aspects. Topics include economic analysis of market failures and government remedies; property, tort, and contract law; and economic and social regulation. Students are encouraged to develop critical skills in analyzing various types of economic policy. Requires knowledge of microeconomics.

ECON 7271. Industrial Organization. 4 Hours.
Analyses the market structure of industries and strategic behavior by businesses, and the effect that these have on economic performance. Draws on economic theory, empirical evidence, and case studies. Also includes a brief discussion of governmental policies such as antitrust, regulation, and public ownership/privatization.

ECON 7710. Microeconomic Theory 2. 4 Hours.
Continues ECON 5110, building on its theories. Topics include game theory, economics of information, incentive theory, welfare economics, general equilibrium, and social choice theory.

ECON 7720. Macroeconomic Theory 2. 4 Hours.
Continues ECON 5120. Offers an advanced course in macroeconomic analysis where economic theory and econometric evidence are brought together to explain economic events and changes at the macro level including economic growth, changes in unemployment and inflation rates, and business cycles. Topics include the Solow growth model, overlapping-generations models, research and development models of growth, real-business-cycle theory, Keynesian theories of economic fluctuations, microfoundations, consumption, investment, unemployment, inflation and monetary theory, and budget deficits and fiscal policy.
ECON 7740. Applied Econometrics 2. 4 Hours.
Continues ECON 5140. Extends students’ understanding of econometrics beyond the topics covered in the earlier course. Students develop and complete an econometric research project using methods covered. Topics include models with multiple equations, nonlinear regression models, asymptotic theory, maximum likelihood, discrete choice models, limited dependent variables and duration models, panel data, regression models for time-series data, and unit roots and cointegration.

ECON 7763. Labor Market Analysis. 4 Hours.
Offers a theoretical and methodological survey of the field of neoclassical labor market analysis at the PhD level. Topics include the supply of labor from the perspective of the individual and the family, human capital, the demand for labor, market equilibrium, and the determination and distribution of wages and earnings. Other topics that may be included are unions, unemployment, labor mobility, alternative models of labor markets, labor productivity and growth, and income distribution and poverty.

ECON 7764. Topics in Labor Economics. 4 Hours.
Covers the theoretical and empirical issues surrounding current topics in the area of labor economics. Topics may vary each time the course is offered and may include discrimination, efficiency wage theory, labor legislation, life cycle analysis, and the use of microdata (panel studies, search behavior, intergenerational earnings mobility, and employment and training policies).

ECON 7771. Framework of Industrial Organization. 4 Hours.
Sets out the analytical framework of industrial organization economics—the basis and method for evaluating the performance of markets and firms and for prescribing policies for improvement. Topics include size and structure of firms, market concentration, pricing in oligopoly and other markets, entry and entry deterrence strategies, and advertising and product strategies. Each of these topics is examined using a range of tools including microeconomic theory, game theory, and statistical analysis.

ECON 7772. Public Policy Toward Business. 4 Hours.
Covers the three major facets of public policy toward business: antitrust, regulation, and privatization. Demonstrates how economic theory and evidence are brought to bear on practical questions of market failure and policies to remedy such failure. Topics include mergers, collusion and facilitating practices, predatory conduct, cost of service regulation, price caps and incentive regulation, deregulation, and public enterprise vs. privatization. Policies are analyzed for their rationale, techniques for implementation, and effects as measure in the context of actual experience in the United States and other countries.

ECON 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ECON 7976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May not be substituted for requirements leading to a BA or BS in economics. May be repeated without limit.

ECON 7990. Thesis. 1-4 Hours.
Provides thesis supervision by members of the department. May be repeated without limit.

ECON 7996. Thesis Continuation. 0 Hours.
Provides thesis supervision by members of the department.

ECON 8550. Internship In Economics. 1-4 Hours.
Comprises academic credit for internship work in economics. May be repeated without limit.

ECON 8960. Exam Preparation—Doctoral. 0 Hours.
Provides students with the opportunity to prepare for the qualifying exam during the semester in which they are registered for this course. Registration in this course constitutes full-time status.

ECON 8966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

ECON 8982. Readings. 1-4 Hours.
Offers supervised reading in selected topics in economics. May be repeated without limit.

ECON 8984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

ECON 9000. PhD Candidacy Achieved. 0 Hours.
Indicates successful completion of the doctoral comprehensive exam.

ECON 9986. Research. 0 Hours.
Offers an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

ECON 9990. Dissertation. 0 Hours.
Taken for two consecutive semesters, normally at the beginning of the dissertation period, to meet the residency requirement of the doctoral program. May be repeated once.

ECON 9996. Dissertation Continuation. 0 Hours.
Requires registration for those students who have completed the doctoral program’s residency requirement, but who have not yet completed the dissertation. May be repeated without limit.

ECON 1100. Principles of Microeconomics. 3 Hours.
Focuses on the development of the basic theory of supply and demand and market prices, as well as competition and monopoly and income distribution. Applies economic principles to selected problems such as poverty, pollution, and international trade.

ECON 1200. Principles of Macroeconomics. 3 Hours.
Introduces macroeconomics, the study of the economy as a whole. Macroeconomics applies the basic principles of economics to whole economic systems and the relationships among sectors of the economy. Topics include unemployment, inflation, national income and employment theory, government expenditures and taxation, the role of the banking system, and monetary and fiscal policies. Emphasizes the development of conceptual tools to analyze the economic problems facing modern society.

ECON 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ECON 2350. Comparative Economic Systems. 3 Hours.
Examines the major economic systems of the world, in both theory and practice. Focuses on encouraging a general understanding of how economic systems work and how economic theory interacts with government policy, history, and culture to explain economic performance. Examines in some detail several advanced market capitalist countries, the former socialist economies, and transitional economies.

ECON 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
ECN 4896. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major.

ECN 4950. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

ECN 4955. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ECN 4983. Topics. 1-4 Hours.
Covers special topics in economics. May be repeated without limit.

ECN 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ECN 4991. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

ECN 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ECN 4993. Independent Study. 1-4 Hours.
Offers students the opportunity to undertake special research. Requires prior completion of 96 QH with a 3.00 GPA.

ECN 4994. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

ECN 4995. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

ECN 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ECN 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ECN 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

ECN 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

ECN 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ECN 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

ECN 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

ECN 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

ECN 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

ECN 6983. Topics. 1-4 Hours.
Covers special topics in economics. May be repeated without limit.

ECN 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

EDUC 1111. Education in the Community. 4 Hours.
Considers the unique contributions of community, family, and public schools to education in the United States today. Uses classroom and field-based activities to provide historical and social contexts of public education. Encourages students to reflect on their own prior education, to learn from persons active in the education community, and to consider their future roles as educators.

EDUC 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EDUC 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EDUC 3521. Field Experience. 0 Hours.
Provides field placement and performance assessment that complements an intermediate or advanced course taken concurrently by students in the School of Education. Requires admission to the School of Education.

EDUC 3568. Literacy Field. 0 Hours.
Provides field placement and performance assessment that complements EDUC 5121 taken concurrently by students in the School of Education.

EDUC 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EDUC 4000. Ethics and Education. 4 Hours.
Offers an interdisciplinary ethics and education course intended for students interested in considering how educators’ ethical dispositions, decisions, and behaviors affect and reflect a society’s values and ideals. Covers three primary areas of inquiry in this course. The first is the field of ethics itself—ethics of duty, idealism, utilitarianism, virtue, relativism, pragmatism, pluralism, critical ethics, ethics of care, and ethics of professionalism. The second is these ethical paradigms’ import for education, including issues relating to equality, diversity, cultural recognition, competition, dishonesty, privacy, discrimination, reward, and punishment. Third, the course considers particular theories of moral development and their relationship to moral education. Emphasizes the particular types of ethical issues presented in urban education contexts.

EDUC 4504. Learning and Accomplished Practice. 4 Hours.
Offers a practice-mediated survey of contemporary educational theory of human learning and accomplished teaching. Students develop a working understanding of teaching and learning as they occur in different types of schools and community settings. Investigates two kinds of theories: theories learning and cognition-how humans learn, acquire knowledge, and make sense of their experience; and theories of teaching or pedagogy-how best to teach for understanding and learning achievement. Students synthesize their developing understanding through their instructional activity with children in field placements. Includes a field placement and performance assessment to complete the course satisfactorily. Graduate students are required to demonstrate advanced levels of study and research.
EDUC 4511. Curriculum Design and Assessment. 4 Hours.
Explores the discourse about ‘curriculum’ as an evolution in our thinking about what’s worth learning and teaching. Links learning theory and teaching practice in three key areas: the impact of the community on the student as learner, the role of pedagogy in creating access to learning for all students, and the selection of curriculum content to create both inclusive and challenging learning environments. Students examine and develop several curricula as they explore the process of curriculum construction and the theoretical perspectives that affect what and how teachers teach, and how they assess student work. Presents an opportunity, prior to student teaching, for students to model both the concrete activities of the curriculum design process and their reflection on that process. Graduate students are required to demonstrate advanced levels of study and research.

EDUC 4521. Language, Culture, and Literacy in Middle and High Schools. 4 Hours.
Examines the interrelationships among language, culture, and identity, and explores the implications of those relationships for effective teaching in middle schools and high schools. Considers issues of linguistic diversity within their broad sociopolitical and philosophical contexts, emphasizing how language discrimination and inequality within the context of other forms of systematic oppression function in our society. Explores the processes of identity development in the context of schooling and literacy performance. Also examines methods of helping linguistically diverse students to develop their oral and written language abilities within a learning environment that draws upon and celebrates their native language abilities and traditions. Graduate students are required to demonstrate advanced levels of study and research.

EDUC 4522. Teaching the Language Arts. 4 Hours.
Aims at developing competence and confidence in secondary teachers working with diverse students, many of whom appear to read and write only when required to do so. Considers the design and practices of traditional English curricula at the middle and high school level, and explores alternative syllabi and unit design as strategies for actively engaging students in the pursuit of meaning in reading and writing as they enhance their skills. Explores the role of research as well as interdisciplinary and collaborative approaches as they relate to curricula in English and the humanities. Graduate students are required to demonstrate advanced levels of study and research.

EDUC 4524. Teaching History and the Social Studies. 4 Hours.
Explores the intersecting disciplines of history and social studies including geography, sociology, economics, political science, and history. Emphasizes the interrelatedness of disciplines and the emerging role of middle and high school students as citizens in their school, community, nation, and the world. Examines the challenge of covering all the material deemed essential by state and district curriculum frameworks, while helping one’s students become problem-solvers and critical thinkers in their analysis of social problems. Graduate students are required to demonstrate advanced levels of study and research.

EDUC 4525. Teaching Science. 4 Hours.
Examines how the evolving nature of science-ideas, theories, concepts, and controversies-relates to diverse middle and high school students, and how teachers can use experience-based, problem-centered approaches that engage the range of student learners and help them meet local and state learning goals. Identifies research possibilities within school contexts, both inside and outside the laboratory. Explores curricular frameworks and culturally relevant content to enable teachers to create a learning environment that supports inquiry and problem solving. Analyzes examples of excellent curriculum products, programs, assessments, and technology tools. Students develop a curriculum unit including assessment philosophy and practices. Graduate students are required to demonstrate advanced levels of study and research.

EDUC 4526. Teaching Mathematics. 4 Hours.
Explores mathematics teaching methods that are research based, experienced based, and grounded in the contemporary theoretical frameworks influencing mathematics education. Emphasis is on issues related to teaching math in an urban school, problem solving, communication, connections, and integrating technology as well as issues of access and equity, assessment, and cross-content teaching strategies. Graduate students are required to demonstrate advanced levels of study and research.

EDUC 4530. Race and Urban Education. 4 Hours.
Provides an intensive examination of racism in the United States and the implications of race on homophobia, sexism, and so on, with a focus on the context of urban education. Through the lenses of color, ethnicity, and class, explores questions and concepts that lie at the heart of our personal and professional interactions in the school, classroom, and the community. Students are expected to participate in class discussion and begin the personal exploration of their own feelings and experiences with racism. Combines formal lectures with group and small-group discussions, fieldwork, and video presentation.

EDUC 4552. Inquiry in the Humanities and Social Sciences at the Elementary Level. 4 Hours.
Examines how teachers enhance children’s understanding of history and social studies as part of a coordinated approach to the humanities. The goal is for teachers to engage students actively in reading, writing, and speaking through approaches that develop critical skills and habits of mind in relation to issues of citizenship, community, social justice, and the pursuit of truth in an evolving world. Explores methodology and curriculum design, applicable within and beyond social studies/history and language arts/English. Graduate students are required to demonstrate advanced levels of study and research.

EDUC 4553. Inquiry in Math and Science at the Elementary Level. 4 Hours.
Designed to help students enhance their understanding of how children develop math, science, and technology knowledge and skills, and how the three areas are interconnected. Examines research into current issues influencing elementary school math, science, and technology. Emphasis is on strategies for planning and implementing an integrated lesson; equity, gender, and access issues; problem solving; state and national curriculum and assessment issues related to math, science, and technology education; and standards-based curriculum materials. Graduate students are required to demonstrate advanced levels of study and research.

EDUC 4567. Literacy Development and Instruction. 4 Hours.
Using an inquiry approach, explores the rich complexity of literacy development and instruction in the elementary grades. Considers reading and writing as ways of exploring and reacting to the world in a thoughtful, articulate manner. Considers how reading, writing, speaking, and listening are interrelated, critical processes for exploring and responding to the world. An integrated language model serves as a basis for instructional methodology. Explores a range of approaches to reading and writing instruction based on students’ own experiences and questions, in light of research on cognitive development and language acquisition, and informed by political and sociocultural perspectives. Graduate students are required to demonstrate advanced levels of study and research.

EDUC 4570. Inclusion, Equity, and Diversity. 4 Hours.
Provides students with tools and understanding to address the range of learning needs of special education legislation, as well as the politics of who is identified and why. Examines students’ own attitudes about teaching children with learning disabilities, and develops skills and strategies for identifying and teaching. Graduate students are required to demonstrate advanced levels of study and research.
EDUC 4850. Teaching Practicum. 8 Hours.
Supervised 300-hour-minimum practicum situated within Boston Public School system that meets the requirements for Massachusetts State initial licensure. The teacher candidate is mentored by cooperating teachers and NU faculty to meet performance assessment of professional standards. Director of field placement approval required. Requires appropriate fieldwork, completion of education licensure courses, and passing scores on the Massachusetts Tests for Educator Licensure (MTEL).

EDUC 4851. Teaching Seminar. 4 Hours.
Integrates theoretical knowledge and practical understanding through a cycle of action and reflection. In conjunction with a teaching practicum, enables the teacher candidate to meet the professional standards for Massachusetts State initial licensure. Requires appropriate fieldwork and completion of education licensure courses.

EDUC 4936. Disciplines Field. 0 Hours.
Provides field placement and performance assessment that complements the following discipline courses: EDUC 5122, EDUC 5124, EDUC 5125, or EDUC 5126 taken concurrently by students in the School of Education.

EDUC 4947. Teaching Preparatory Lab 3. 0 Hours.
Provides field placement and performance assessment that complements an intermediate or advanced course taken concurrently by students in the School of Education. Requires admission to the School of Education.

EDUC 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

EDUC 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

EDUC 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EDUC 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

EDUC 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

EDUC 5504. Child and Adolescent Development, Learning, and Teaching. 4 Hours.
Surveys contemporary educational theory of human learning and accomplished teaching. Offers students an opportunity to develop a working understanding of teaching and learning as they occur in different types of schools and community settings. Investigates how children and adolescents learn, acquire knowledge, and make sense of their experience, as well as theories of teaching or pedagogy—how best to teach for understanding and learning achievement.

EDUC 5570. Inclusion, Equity, and Diversity. 4 Hours.
Addresses the range of learning needs of special education legislation, as well as the politics of who is identified and why. Examines students’ own attitudes about teaching children with learning disabilities. Offers students an opportunity to develop skills and strategies for identifying and teaching learning-disabled children. Requires graduate students to demonstrate advanced levels of study and research.

EDU 0650. Developing an Experiential Learning Idea. 2 Hours.
Offers students in this first experiential learning action module an opportunity to reflect and document their personal understanding, definition, and examples of experiential learning; to compare their understanding of experiential learning to different theories, literature, and examples of experiential learning; to develop their ideas for creating an experiential learning initiative in their context; and to develop a pitch for their plan, which will be presented to key stakeholders within their region for feedback.

EDU 0651. Creating an Experiential Learning Plan. 2 Hours.
Offers students in this second experiential learning action module an opportunity to apply understanding of the concepts, theories, and models of organizational change to inform the successful implementation of their experiential learning initiative; to explore how to engage educators in considering the development and pursuit of entrepreneurial activities at the national, local, and personal level, and the behaviors and conditions that support and impede their efficacy; and to develop a detailed plan and program evaluation for their experiential learning initiative.

EDU 0652. Implementing an Experiential Learning Plan. 2 Hours.
Offers students in this third experiential learning action module an opportunity to explore a number of qualitative and quantitative methods that can be used to identify a variety of qualitative and quantitative data to inform their detailed plan and program evaluation for their experiential learning initiative; to implement their experiential learning initiative; and to engage regularly with faculty, coaches, and mentors to negotiate unforeseen obstacles and challenges.

EDU 0653. Evaluating and Sharing an Experiential Learning Plan. 2 Hours.
Offers students in this last experiential learning action module an opportunity to organize, analyze, and synthesize data collected during the implementation and answer their program evaluation questions; to disseminate their findings through the creation of a webpage of their experiential learning initiative and create an experiential learning talk; and to explore how to secure funds for future experiential learning initiatives and create plans for sustaining their experiential learning initiative and bring their experiential learning initiative to scale.
EDU 0711. Understanding Autism Spectrum Disorders. 2.4 Hours.
Explores the unique characteristics of students with autism spectrum disorder (ASD), including impairments in language, social skills, sensory processing, and behavioral regulation. Offers detailed information on the current research and media trends in the following areas: diagnostic classification of autism, Asperger syndrome, Rett syndrome, childhood disintegrative disorder, and pervasive development disorder-NOS. Examines intervention strategies applicable to both regular and special education classrooms with particular emphasis on best practices and evidence-based interventions.

EDU 0791. Integrating Poetry and Drama across the Curriculum. 6.8 Hours.
Encourages participants to tap into their creativity through the medium of dramatic and poetic arts. Seeks to enable them to engage students, deepen learning, foster innovation, and make interdisciplinary connections to the curriculum and goals of state standards. Designed for teachers of all grades and disciplines.

EDU 0792. The Critical Mind: Inspiring Interdisciplinary Thinking in American Humanities. 6.8 Hours.
Seeks to enable teachers to transform American literature and history courses or units into inclusive interdisciplinary humanities models. Using the prevailing philosophy and ideas of each historical era as a paradigm, the course examines examples of literature, history, music, art, architecture, and archetypal American heroes as depicted in classic American films. Participants are encouraged to engage in classroom discussions, breakout sessions to share new possibilities for interdisciplinary lesson plans, and activities that enhance curriculum content.

EDU 0793. Supporting Traumatized Children in the Least Restrictive Environment. 6.8 Hours.
Examines the necessary supports for children with trauma histories to become successful in school. Explores strategies for restructuring academic content, the application of therapeutic and behavioral interventions for positive supports, ways to ensure a safe school environment, and activities to build the social and interpersonal skills of traumatized children. Also reviews family dynamics and stressors related to parenting a child with trauma, along with information on accessing available supports.

EDU 0902. Using Graphic Design as a Teaching Tool for the K–12 Classroom. 6.8 Hours.
Explores how to integrate visual presentations, posters, timelines, and diagrams into classroom practice. Offers participants an opportunity to learn what it means to “think like a graphic designer.” The language of graphic design lives in the classroom. Through presentation, dialogue, hands-on work, and critique, participants explore curriculum content and practices and assess non-text-based student work. Designed to support the transition of teachers from under-resourced learning communities in South Africa to a pedagogy that supports outcome-based educational goals and leadership development. Offers teachers an opportunity to explore how to create more effective learning environments, how to apply micro-skill theory to the lesson-planning process, how to engage students in critical thinking and analysis, and how to expand their skill sets in content remediation and assessment. Emphasizes the integration of technology in instruction, including the use of Smart Boards, educational software, and Internet-based resources.

EDU 0909. Current Issues in Education. 1-4 Hours.
Explores a variety of current educational issues. Topics may include content in disciplines such as mathematics, science, English language, arts, and others. Presents and discusses pedagogy and teaching strategies. Exploration of best practices, current research, and readings are designed to supplement class discussion. Participants are expected to demonstrate their competence in this work by exploring ways to apply this new information to their classroom practice. May be repeated for up to 44 total credits.

EDU 0946. Portfolio and Panel Review. 0 Hours.
Offers students an opportunity to complete a portfolio that includes work products demonstrating competencies in the Massachusetts Department of Education Professional Standards for Teachers. Students present a completed video and/or portfolio in which they demonstrate competencies.

EDU 0947. New Approaches to Pedagogy. 6.8 Hours.
Explores practical models for planning and designing curriculum. Offers teachers an opportunity to create curriculum that aligns with their national curriculum standards. As an outcome of this course, teachers prepare a curriculum portfolio notebook.

Explores some of the best practices in serving students with more complex academic and social needs, including those with physical, communication, developmental, and suspected intellectual impairments. Examines ways to increase access to high-quality academic and functional content through the use of universal and individually designed accommodations and modifications to both the explicit content as well as the embedded curriculum. Emphasizes the development of language systems, the use of aided language stimulation, and the functionality of core vocabulary. Reviews the current application of pragmatically organized dynamic displays (PODD systems), focusing on the broader implications in the future. Addresses the development of literacy and numeracy skills through the review of instructional practices, systematically layered content, and effective accommodations.

EDU 0970. Understanding and Addressing Needs of Students with Social Cognitive Deficits. 6.8 Hours.
Offers a hands-on/interactive course designed to provide participants with a basis for understanding the social and cognitive deficits in students diagnosed with high-functioning autism, pervasive developmental disorder not otherwise specified (PDD-NOS), Asperger syndrome, nonverbal learning disability, and attention deficit hyperactivity disorder (ADHD), as well as the challenges these conditions present both in and out of the classroom. Analyzes social thinking as described in the work of Michelle Garcia Winner. Offers participants functional treatment strategies and an opportunity to better understand why these students react and respond the way they do. Examines available social skills assessment tools and resources designed to assist in developing and implementing social thinking curriculum. Also covers instruction in how to write individual education plan (IEP) goals and objectives.
EDU 0973. Mentoring in Action: Instructional Coaching for Educators. 6.8 Hours.
Seeks to advance effective teaching practices that enhance student learning through mentoring protocols. The instructor uses an interactive reflective approach that highlights practical strategies, readings, and research that can be adapted for all grade levels. Topics include observation and feedback techniques, quality conversations for busy educators, strategies for group mentoring, and organizing a new teacher support program. Presents a month-by-month curriculum for supporting effective teaching practices. Emphasizes conversations related to student learning. Course objectives are aligned with the Department of Elementary and Secondary Education (DESE) Guidelines. Participants also have an opportunity to learn how to implement effective mentoring protocols that retain qualified teachers. Materials are appropriate for mentor teachers, coaches, department chairs, and administrators.

EDU 0987. Using Data to Enhance Student Achievement. 6.8 Hours.
Explores how to use data more effectively. Examines ways of collecting and analyzing data. Expands common notions of data beyond grades and test scores to include more subtle forms of data such as classroom observations and environmental surveys. Educators are increasingly surrounded by data. However, studying educational data does not automatically lead to school improvement or student success. Encourages participants to provide their own data for this work, though this is not a requirement. Participants then have an opportunity to use these data sets to create a richer understanding of schools, students, and the many ways the participants can strive toward social justice as educators.

EDU 0988. Integrating Art into the Curriculum. 6.8 Hours.
Seeks to introduce teachers to the value of integrating the arts modalities into the everyday curriculum by providing teachers with strategies that can be used immediately in their classes. Students can expect to engage in drama, poetry, music, creative movement, and visual art. This course is highly interactive.

EDU 0990. Making Schools Safe: Addressing Harassment, Bullying, and Hate Crimes in Schools. 6.8 Hours.
Examines common mistakes and issues contributing to major school conflicts, incidents of violence, racial and other forms of intergroup tensions. Investigates how to assess, prevent, and respond to bullying and harassment, as well as how to identify educationally equitable practices in classrooms and schools to promote engagement of students from diverse backgrounds. Incorporates real-life situations and experiential activities throughout to help participants develop incident-response strategies for successfully communicating with students, parents, and administrators.

EDU 0998. Strategies for Effective Classroom Management. 6.8 Hours.
Offers an interactive course designed to provide educators with the best practices for effective classroom management. Offers participants an opportunity to learn specific strategies on how to establish a productive classroom climate, effectively support students with special learning and behavioral needs, and apply learned techniques and interventions to real-life classroom situations. Examines how to create a learning community that encourages positive social interaction, active engagement, and increased self-regulation for all students.

EDU 0999. Comprehensive Case Management for the Special Education Classroom. 6.8 Hours.
Surveys the unique roles and responsibilities of the special educator as case manager. The overview includes advocacy for students as they develop greater levels of independence and self-directed learning behaviors. Emphasizes liaison competencies through effective communication systems between and among stakeholders in school, home, community, and outside agencies. Explores transition planning, implementation of individualized education plans (IEPs), and the role as team leader. Offers participants an opportunity to develop an understanding of the various systems for collecting and using data to inform instruction and to develop effective program continuums for students with disabilities. Establishes and discusses the legal responsibilities of case management throughout the course.

EDU 1031. Inclusion, Equity, and Diversity. 3 Hours.
Designed to enable current and future teachers to understand and plan for the broad range of student learning and behavioral styles found in every public school classroom. Examines the historical, political, and social forces shaping special and general education, as well as the current push toward Inclusion and Universal Design for Learning, and the implication of this push for students with disabilities. Discusses the neurodevelopmental functions underlying learning, along with their variations and pedagogical implications. Explores how teachers can humanely and effectively respond to the challenging student behavior of many sorts, with strategies grounded in community building, and group and individual management techniques.

EDU 2004. Learning and Accomplished Practice. 4 Hours.
Examines the learning process and how an understanding of the nature of learning can lead to the implementation of effective instruction. Offers students an opportunity to study theoretical perspectives and pedagogical research in order to understand student development and diversity and to focus on how students learn. Challenges students to demonstrate a working understanding of teaching and learning as these occur in different types of school and community settings. All these facets are essential for a comprehension of three core principles: (1) characteristics that students bring to the classroom, encompassing how students are likely to be different from one another; (2) research referring to how students learn; and (3) the conversion of knowledge about development, diversity, and learning into effective teaching practice.

EDU 3405. Inquiry in Humanities and Social Science. 4 Hours.
Examines how teachers enhance children's understanding of history and social studies, as part of a coordinated approach to the humanities. The goal is for teachers to actively engage students in reading, writing, and speaking through approaches that develop critical skills and habits of mind in relation to issues of citizenship, community, social justice, and the pursuit of truth in an evolving world. The desired outcome is that teachers are able to assist students in preparing themselves to play an active role as citizens in a democratic and culturally diverse society. Explores methodology and curriculum design applicable within and beyond social studies/history and English/language arts.
EDU 3414. Literacy Development and Instruction. 4 Hours.
Introduces foundational theoretical and practical instructional principles for developing reading, writing, and language arts in the elementary grades. Offers students an opportunity to acquire beginning knowledge of varied materials and classroom-based assessment for emergent, beginning, and fluent readers and writers. Explores the interrelationship of reading, writing, listening, and speaking. Focuses on the influence of language, culture, and learning style; on literacy development; and underscores the role of home and community. Addresses issues of equity that surround literacy teaching and learning. Explores how literacy is a sociocultural phenomenon often at the center of political debate. Emphasizes how teachers can meet the needs of all learners and use reading, writing, and language as tools for exploring and questioning the world around them in meaningful ways.

EDU 3415. English-Language Learners in General Education. 4 Hours.
Designed to introduce K–12 general educators to skills that enable them to work more effectively with English-language learners in their classrooms. Explores the history of bilingual education in the United States and other programs used to teach English-language learners. Offers participants an opportunity to develop sheltered English instructional strategies to scaffold lessons that can be used in any classroom setting where English-language learners are present and to plan lessons using Massachusetts English Language Proficiency Benchmarks and Outcomes.

EDU 4818. Supervised Teaching Practicum. 6 Hours.
Offers supervised semester-long student teaching in a classroom in a school system. Guides students in their teacher candidate experience. Seeks to assist students in becoming reflective practitioners. The seminar is structured to provide students with a peer community of practice and designed to acquaint students more intimately with the Pre-Scholar Performance Assessment Professional Standards for teachers.

EDU 5210. Mind in the Making: Social, Emotional, and Intellectual Learning Are Inextricably Linked. 3,4 Hours.
Designed on the research-based premise that teaching improves when educators have a working knowledge of the significant research in child development and are able to translate this knowledge into their classroom practice. Reviews current research on quality programming for young children. Focuses on translating this research into best teaching practices. Topics include respectful relationships, practices, and policies; social, emotional, and intellectual growth; environments that support child development; multicultural perspectives on parenting and child development; and creating learning communities of teachers and families.

EDU 5900. Consortium Study—Hebrew College. 8 Hours.
Offers an opportunity to study at Hebrew College. May be repeated up to six times for up to 48 total credits.

EDU 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. May be repeated up to five times.

EDU 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

EDU 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

EDU 6023. Institute in Creating a Community of Learners/Behaviors. 4 Hours.
Designed to support student understanding of the theory, research, and practice pertaining to creating a sense of community in the classroom. Offers students an opportunity to critically examine a number of behavior management approaches and to develop practical interventions and skills for preventing and remediating behavior problems. Addresses the principles of “functional assessment” through an exploration of “responsive classroom” techniques.

EDU 6050. Education as an Advanced Field of Study. 5 Hours.
Focuses on the critical evaluation, interpretation, and uses of published research in education as a field of study. Offers students an opportunity to explore the relationship between theory and practice and the changing nature of knowledge, to examine peer-reviewed research articles, to learn the “rules” and methods through which these scholarly works are developed, and to begin to apply research findings to real problems and issues in education. As part of this course, students use an ePortfolio as they begin to document their development as scholars, practitioners, and leaders in the field of education.

EDU 6051. Culture, Equity, Power, and Influence. 4 Hours.
Examines the broad construct of culture and explores how these characteristics impact personal identity, access to education, social mobility, power, and influence. Explores educational institutions as cultural systems and questions concepts at the heart of personal and professional interactions in teaching, learning, curriculum, and administration. Expects students to participate in reflective discussion and begin the personal exploration of their own feelings and experience with culture; to develop competencies spanning cultural and international boundaries; to prepare to be more effective in diverse settings; and to influence and advocate for systemic change.

EDU 6054. Emerging Trends in Education: Redesign, Renewal, and Retention. 4 Hours.
Examines the need for and the complexity of initiating and implementing new models of education. Rather than focus on educational reform, the course concentrates on and critically examines exemplary programs, practices, institutions, and policies. Offers students an opportunity to delve into the social, historical, and philosophical foundations of the field, including the theories of diffusion of innovation, barriers to change, “tipping points,” and technological innovation. This dynamic course covers the broad field of education from prekindergarten to lifelong learning, public to private, and home schooling to international.

EDU 6055. Sociocultural Context of Learning and Development. 4 Hours.
Examines learning, teaching, and scholastic development from a sociocultural theoretical perspective that includes situated learning and activity theory. Examines learning achievement and social development of children in diverse educational settings from the perspective that people learn, achieve, and develop as participants in cultural communities. Describes schools as cultural communities and social environments and applies this to the personal and scholastic development in its young people. Examines practices that promote literacy development, numeracy, other academic proficiencies, and identity formation of young people. Using the case of the African-American experience in the United States, the course offers a systematic account of socialization and cultural practices necessary for achievement and development of all learners of diverse backgrounds.
EDU 6064. Curriculum and Assessment. 4 Hours.
Presented how curriculum, student performance, and assessment are currently practiced in a variety of school settings with a view toward changing current practice to meet future needs. Offers students an opportunity to learn how to become active players in creating or improving curriculum at the classroom level, the school, or within a whole school district and to be able to link curriculum and assessment directly to student achievement.

EDU 6066. Foundations of Literacy Development and Instruction. 4 Hours.
Introduces fundamental theoretical and practical instructional principles of developing reading, writing, and language arts, grounded in research on cognitive development and language acquisition, and informed by political and sociocultural perspectives. An integrated language model suggests that reading, writing, and thinking be viewed as interrelated, critical processes for exploring and responding to the world. Offers students an opportunity to acquire foundational knowledge of materials, instructional strategies, and assessment tools that support developing literacy and engaging learners.

EDU 6100. Literacy. 2 Hours.
Introduces the foundations of balanced literacy, theories of literacy development, instructional strategies, assessment, and program development across the grades. Links the focus on early literacy acquisition to clinical assessment and questions regarding English-language learners and students with mild to moderate disabilities and variations.

EDU 6104. Child and Adolescent Development, Learning, and Teaching. 4 Hours.
Surveys contemporary educational theory of human learning and accomplished teaching. Offers students an opportunity to develop a working understanding of teaching and learning as they occur in different types of schools and community settings. Investigates how children and adolescents learn, acquire knowledge, and make sense of their experience, as well as theories of teaching or pedagogy—how best to teach for understanding and learning achievement.

EDU 6107. Inclusion, Equity, and Diversity. 4 Hours.
Addressed the range of learning needs of special education legislation, as well as the politics of who is identified and why. Examines students' own attitudes about teaching children with learning disabilities. Offers students an opportunity to develop skills and strategies for identifying and teaching learning-disabled children. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6110. Instructional Strategies in Special and Inclusive Education. 4 Hours.
Provides a historical overview of the development of special education in the United States, with a special focus on the post-PL 94–142 period. Raises questions of assessment and classification in relation to race and social class, as well as the ever-evolving nature of special education classifications in the "mild-to-moderate" range of disabilities. Explores components of assessment, instruction, and curriculum developments for students with a range of learning and behavioral differences and implications for practice.

EDU 6115. Transition to Teacher Seminar 1. 4 Hours.
Readies students for the practicum, EDU 6966. Focuses on human development, curriculum development, and the social/political foundations of urban education. An interlocking set of readings and linked discussions is geared to enabling students to begin developing a viable "philosophy of education" that moves their thinking beyond personal experience. Offers students an opportunity to link theory and practice in ways that take into account the "messy" nature of human difference and political/educational practices.

EDU 6119. Curriculum for the Pre-K Years. 4 Hours.
Presented theories of active learning and learning through play as applied in the prekindergarten years. Offers students the opportunity to learn to specify goals in order to facilitate children's growth, development, and achievement of skills in communication, inquiry, creative expression, and interpersonal relations; plan, implement, and evaluate content and methodology in various curriculum areas; incorporate developmentally appropriate, integrated learning experiences; select materials and create learning environments; and integrate children with special needs. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6120. Transition to Teacher Seminar 2. 4 Hours.
Focuses on human development and curriculum development, with a deeper and more sustained exploration of learning and behavioral variations and the implications for practice. Examines the links between ongoing assessment and teaching and the implications of curriculum standards on the lives of students—with and without IEPs—and their teachers and families. This seminar is linked to the teaching practicum, EDU 6966. Continues to offer students an opportunity to integrate theory and practice through a cycle of reflection, action, and critique.

EDU 6122. Teaching the Language Arts. 4 Hours.
Offers secondary teachers an opportunity to develop competence and confidence working with diverse students, many of whom appear to read and write only when required to do so. Considers the design and practices of traditional English curricula at the middle and high school level and explores alternative syllabi and unit design as strategies for actively engaging students in the pursuit of meaning in reading and writing as they enhance their skills. Explores the role of research as well as interdisciplinary and collaborative approaches as they relate to curricula in English and the humanities. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6123. Adolescents in the Middle School. 4 Hours.
Offers students an opportunity to develop a working understanding of human development in adolescence, especially as it applies to teaching and learning in the middle school setting. Focuses on developing a deep theoretical and practical understanding of development of adolescents in the unique social learning contexts and cultures of middle schools. Addresses Massachusetts state standards for teaching in a middle school.

EDU 6124. Teaching History and the Social Sciences. 4 Hours.
Explores the intersecting disciplines of history and social studies, including geography, sociology, economics, political science, and history. Emphasizes the interrelatedness of disciplines and the emerging role of middle and high school students as citizens in their school, community, nation, and the world. Examines the challenge of covering all the material deemed essential by state and district curriculum frameworks, while helping one's students become problem solvers and critical thinkers in their analysis of social problems. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6125. Making Connections: Schools, Families, and Communities. 4 Hours.
Explores how partnership among schools, families, and community members contributes to whole school reform efforts and the reaching of high academic standards for all children. Reviews the current research on the impact of partnership on student achievement and the effective strategies used by schools to cultivate and maintain partnerships with families and communities.
EDU 6126. Literacy for “Special” Learners: The Challenges of Inclusion. 4 Hours.
Combines classroom and field-based experiences to offer students an opportunity to develop the leader’s capacity to work with leadership teams and a diverse community in an organizational context. Studies the forces that shape organizations and communities that define organizational culture in particular. Uses students’ actual experiences as a springboard to examine organizational function and to explore leader identity and behavior with respect to the specific cultural context of a school.

EDU 6127. Teaching Science. 4 Hours.
Examines how the evolving nature of science—ideas, theories, concepts, and controversies—relates to diverse middle and high school students and how teachers can use experience-based, problem-centered approaches that engage the range of student learners and help them meet local and state learning goals. Identifies research possibilities within school contexts, both inside and outside the laboratory. Explores curricular frameworks and culturally relevant content to enable teachers to create a learning environment that supports inquiry and problem solving. Analyzes examples of excellent curriculum products, programs, assessments, and technology tools. Offers students an opportunity to develop a curriculum unit including assessment philosophy and practices. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6128. Education and Ethics. 2-4 Hours.
Offers students an opportunity to understand the policies and practices in contemporary education as a dynamic of conflicting power relations, opposing perspectives, and long-standing agendas, as well as obtain a working understanding of, and critical perspective on, the social, cultural, historical, and political dynamics of schools in the United States. Serves as a capstone for the Accomplished Practice Seminar of the MAT program when students present their exit project.

EDU 6129. Teaching Mathematics. 4 Hours.
Explores mathematics teaching methods that are research based, experienced based, and grounded in the contemporary theoretical frameworks influencing mathematics education. Emphasizes issues related to teaching math in an urban school, problem solving, communication, connections, and integrating technology, as well as issues of access and equity, assessment, and cross-content teaching strategies. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6130. Teaching Spanish. 4 Hours.
Explores language teaching methods that are research based, experienced based, and grounded in the contemporary theoretical frameworks influencing language education. Emphasizes teaching Spanish in an urban school, problem solving, communication, connections, and integrating technology, as well as issues of access and equity, assessment, and cross-content teaching strategies. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6131. Assessment. 4 Hours.
Addresses assessing the progress of teachers’ students, formally through exams and informally through many kinds of observation. Today, states and the federal government are engaged in mandating many additional forms of assessments through standardized tests. It is essential for educators to understand the strengths, weaknesses, and purposes of various forms of assessment, while having the skill and understanding to develop clear rubrics for their own assessments and to link all of the many assessments used with their students to their own goals for student learning.

EDU 6132. Curriculum Design and Assessment. 4 Hours.
Explores the discourse about “curriculum” and our thinking about what’s worth learning and teaching. Links learning theory and teaching practice to the community’s impact on the student as learner, the role of pedagogy in creating access to teaching for all students, and the selection of curriculum content to create both inclusive and challenging learning environments. Offers students an opportunity to examine and develop several curricula as they explore the theoretical perspectives that affect what and how teachers teach and how they assess student work. Presents an opportunity, prior to student teaching, for students to model the concrete activities of the curriculum design process and their reflection on that process. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6134. Interdisciplinary Curriculum Design. 4 Hours.
Offers students an opportunity to create coherent, standards-based curricula that integrate two or more academic disciplines. Covers how to employ interdisciplinary curricula to better use instructional time while allowing students to examine topics in greater depth and from multiple perspectives. Also offers students an opportunity to learn how to use backward design to plan curricula and to articulate overarching themes and essential questions that provide organizational centers for interdisciplinary curricula. Focuses on the selection of instructional and assessment strategies that are well suited to interdisciplinary curricula.

EDU 6152. Inquiry in the Humanities and Social Sciences at the Elementary Level. 4 Hours.
Examines how teachers enhance children’s understanding of history and social studies as part of a coordinated approach to the humanities. The goal is for teachers to engage students actively in reading, writing, and speaking through approaches that develop critical skills and habits of mind in relation to issues of citizenship, community, social justice, and the pursuit of truth in an evolving world. Explores methodology and curriculum design, applicable within and beyond social studies/history and language arts/English. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6153. Inquiry in Math and Science at the Elementary Level. 4 Hours.
Examines how teachers enhance children’s understanding of math and science as part of a coordinated approach to the sciences. Explores methodology and curriculum design, applicable within and beyond math and science. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6154. Inquiry in the Sciences and Humanities. 4 Hours.
Explores methods for enabling children in grades 1–6 to experience the dynamics of scientific investigation as they develop their abilities to make thoughtful observation and make meaning of the results of those observations. Examines methods and materials, pedagogies, and assessment strategies that foster integrated learning across the sciences, social sciences, and humanities.

EDU 6155. Inquiry in Mathematics. 4 Hours.
Explores methods for teaching mathematics in grades 1–6 that are research and experience based and grounded in the contemporary theoretical frameworks influencing mathematics education. Designed to increase students’ knowledge of mathematics as it simultaneously explores the intrinsic nature of math and methods for relating it to children. Emphasizes approaches to teaching mathematics that engage diverse populations of children.
EDU 6161. Literacy Development and Instruction. 4 Hours.
Uses an inquiry approach to explore the rich complexity of literacy development and instruction in the elementary grades. Considers reading and writing as ways of exploring and reacting to the world in a thoughtful, articulate manner. Considers how reading, writing, speaking, and listening are interrelated, critical processes for exploring and responding to the world. An integrated language model serves as a basis for instructional methodology. Explores a range of approaches to reading and writing instruction based on students’ own experiences and questions, in light of research on cognitive development and language acquisition, and informed by political and sociocultural perspectives. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6162. Language, Culture, and Literacy in Middle and High Schools. 4 Hours.
Examines the interrelationships among language, culture, and identity and explores the implications of those relationships for effective teaching in middle schools and high schools. Considers issues of linguistic diversity within their broad sociopolitical and philosophical contexts, emphasizing how language discrimination functions within the context of other forms of systematic oppression in our society. Explores the processes of identity development in the context of schooling and literacy performance. Also examines methods of helping linguistically diverse students to develop their oral and written language abilities within a learning environment that draws upon and celebrates their native language abilities and traditions. Requires graduate students to demonstrate advanced levels of study and research.

EDU 6170. Constructing Knowledge. 5 Hours.
Uses a case study, reflective approach to link the classroom experience to educational theories and frameworks. With additional resources provided by Northeastern University, offers participants an opportunity to use the yearlong goals and plans to explore and incorporate learning theory, developmental stages, multiple intelligences, memory, motivation, and learning differences. Affords participants an opportunity to analyze their teaching experiences through a variety of lenses, ranging from developmental learning, inclusion, equity, and diversity. In this course, participants are asked to critically look at curriculum standards and pedagogy of their discipline in relation to each investigated topic, engage peers in dialogue, and examine their assumptions and practices.

EDU 6172. Creating an Effective Learning Environment. 5 Hours.
Offers participants an opportunity to look beyond traditional unit and lesson planning and critically explore the Massachusetts Curriculum Frameworks, unpack their standards, and use data from their classrooms to drive instructional planning. Participants have an opportunity to analyze instructional models and consider how each impacts what students learn, who is less likely to learn, and how to create an inclusive, accessible learning environment. As part of effective instruction, participants examine and critique their own delivery of instruction and management of a classroom, engage with peers around best practices, and reflect on how their practices impact a broad range of students and their learning outcomes.

EDU 6174. Strategies for Effective Instruction. 5 Hours.
Offers students an opportunity to delve into culturally responsive teaching, authentic assessment, and literacy for secondary students. Critical topics include how we are engaging students, if assessments accurately demonstrate student learning, are we differentiating curriculum to meet all students’ needs while still addressing state standards, what it’s like to be a student in my class, how racial identity impacts learning and classroom culture, the meaning of literacy today, and how to apply literacy strategies.

EDU 6180. Teacher as Researcher. 4 Hours.
Introduces students to examples of teacher research, provides an opportunity for them to design and conduct a classroom-based research project, and encourages them to consider the potential role for teacher research to help understand and ultimately transform teaching practice. Provides a model of collaborative practice for teachers as well as instruction in specific skills and approaches to classroom-based research.

EDU 6181. Research Design in Education. 4 Hours.
Introduces inquiry methods that may be used to design research projects and to create effective learning environments. Offers students an opportunity to understand how to design, evaluate, critique, and interpret research outcomes, with an emphasis on the collection and interpretation of quantitative results, and to become proficient in the selection and use of appropriate statistical analyses approaches.

EDU 6182. Educational Statistics. 4 Hours.
Focuses on concepts and methods used in applications of introductory statistics in education. Emphasizes applications to problems in education that are not covered in statistics courses elsewhere and do not involve derivations of statistical techniques. Covers frequency measures, measures of central and general location, measures of variation and probability and their use in making inferences, setting confidence levels, type one and type two errors, tests of significance inclusive of one- and two-sample t-tests, one- and two-way analyses of variance and chi square, correlational techniques inclusive of linear and multiple regression, and analysis of covariance and nonparametric statistics.

EDU 6183. Collaborative Strategies for Effective Classroom Management. 1 Hour.
Explores best practices in classroom organization and behavior management. Topics range from developing student-centered classrooms, routines, and space to strategies for managing transitions, classroom dynamics, individual behaviors, and positive behavioral support systems. Offers participants an opportunity to think critically and plan for a collaborative and productive classroom learning community.

EDU 6184. Interdisciplinary Foundations. 2 Hours.
Provides the iCert Program orientation through three areas of focus: reflection and self-assessment to inform the course selection process; exposure to a broad vision of the contemporary workplace and the competencies required for career success as individuals, members of organizations, and as global citizens; and development of an individual Professional Learning Plan (PLP). Includes a variety of academic and career-related support systems as students embark on a journey that builds on past experiences while providing opportunities for reflection as they develop goals for the future.

EDU 6185. English-Language Learners in the General Education Classroom. 4 Hours.
Designed to introduce K–12 general educators to skills that enable them to work more effectively with English language learners in their classrooms. Explores the history of bilingual education in the United States and other programs used to teach English language learners. Offers participants the opportunity to develop sheltered English instructional strategies to scaffold lessons that can be used in any classroom setting where English language learners are present. Offers participants an opportunity to plan Sheltered English Immersion (SEI) lessons in a Sheltered Instructional Observation Protocol (SIOP) template using the World-Class Instructional Development and Design English Language Development (WIDA ELD) Standards. This course meets DESE requirements for the Sheltered English Immersion (SEI) endorsement.
EDU 6200. Management of Higher Education Institutions. 3 Hours.
Offers students an opportunity to understand the structure, governance, and operations of institutions of higher education, as well as the roles and functions of various administrative positions and offices. Topics include understanding environmental and competitive forces, assessing strengths and weaknesses, managing change and institutional transformation, and issues of implementation and operational execution.

EDU 6201. The Landscape of Higher Education. 4 Hours.
Seeks to provide the foundation to understand the structure, governance, and operations of institutions of higher education, as well as the roles, functions, and interactions of various administrative positions and offices. Through scholarly publications, research articles, and theories, offers students an opportunity to prepare to work and advance effectively within higher education by appreciating its complex organizational structure and its historical context. Assesses how these constructs are subject to today's environmental, financial, technological, and competitive pressures; considers how higher education might implement innovation and change; and offers students an opportunity to design strategies for change.

EDU 6202. Faculty, Curriculum, and Academic Community. 4 Hours.
Examines collaborative approaches to developing and improving both curriculum and the delivery of that curriculum. Faculty and curriculum are not only the core of an institution of higher education, they are also what make institutions of higher education unique from any other type of organization. Topics include academic structure and governance within the context of the wider university community in not-for profit and for-profit institutions. Examines faculty unions, academic freedom, tenure, and the increasing role of adjuncts. Assesses how administration, faculty, and staff interact in an integrated, collegial environment.

EDU 6203. Education Law, Policy, and Finance. 4 Hours.
Offers an overview of the major aspects of the legal, political, and financial environment that impact institutions of higher education, which are affected by laws and policies that range from access, affordability, readiness, and completion to gainful employment. Offers students an opportunity to learn multiple approaches for addressing these requirements, for understanding and influencing policy development at all levels, and for navigating higher education’s financial complexities, both internal and external.

EDU 6210. Faculty: Evolving Roles. 3 Hours.
Examines faculty structure and governance, teaching and practice, faculty assessment and rewards, evolving roles, curriculum design, and basic pedagogical concepts. Faculty and curriculum are not only the core of an institution of higher education, they are also what make institutions of higher education unique from any other type of organization. Today, the role of faculty is changing significantly as tenure is reexamined, adjunct faculty are increasingly becoming the faculty of record in many institutions, electronic delivery of education expands, and globalization and for-profit entities alter curriculum and delivery.

EDU 6211. New Directions for Adult Learning. 3 Hours.
Examines the social and psychological aspects of adult development and learning, the latest technology tools, and the various motivations of adult learners. Begins by recognizing that the concept of lifelong learning has become an increasing reality as adults continually engage in learning activities, whether through their employer, institutions of higher education, or self-directed study. Plus, adult learning is now often delivered electronically via computer, video, or podcasts. Offers students an opportunity to learn various methods of training and development, as well as specific instructional practices, both online and on-ground.

EDU 6212. Needs and Competencies Assessment. 3 Hours.
Examines the various assessment tools and techniques that exist for assessing competencies and organizational needs. Organizations frequently attribute employee performance issues to inadequate training or development, but assessing what the specific competency gaps are often requires both sophisticated assessment instruments and a professional understanding as to how best to address those competency gaps. Topics include learning management systems, delivery options, learning objects, and competency assessment.

EDU 6213. Curriculum and Program Development. 3 Hours.
Focuses on the curriculum development process and takes a project management view of program development. The majority of today's professions require a level of content expertise and specialization that necessitates the continuous development and updating of curriculum and programs intended to prepare individuals for their respective profession. Offers students an opportunity to learn rubrics for curriculum design and their application to course and program development.

EDU 6214. Facilitation and Instruction. 3 Hours.
Examines recent scholarship on teaching and instruction as it pertains to adult students. Offers students an opportunity to learn specific approaches and methods for classroom management and facilitation, as well as train-the-trainer techniques. Topics include establishing an outline, assessing student performance, instructional technology, platform and presentation skills, and addressing difficult issues.

EDU 6215. Higher Education Law. 3 Hours.
Provides an overview of the major aspects of the legal environment that specifically impact institutions of higher education. Institutions of higher education are affected by laws that range from privacy and reporting to admissions and financial aid practices. Offers students an opportunity to learn strategies for addressing these legal requirements and for staying abreast of emerging legal concerns.

EDU 6220. Retention and Enrollment Strategies. 3 Hours.
Examines specific strategies and approaches for building inquiry and application pools, improving retention, targeting specific populations, and positioning the institution in the market. Effective enrollment management needs to support and be aligned with the mission and priorities of an institution. While an understanding of how demographic shifts, international preferences, economic forces, and changes in the law impact enrollment projections and strategies is essential, going beyond these fundamental causal relationships is critical to achieving enrollment management goals in today's dynamic and competitive environment.

EDU 6221. Enrollment, Retention, Graduation, Success. 4 Hours.
Considers the mission of an institution as inseparably linked to student success. Simply identifying, recruiting, and enrolling students is no longer a measure of institutional or academic success. With demographics changing, institutional finances straining, and student loan debt increasing, it is strategically important, and difficult, to find the right students, support them, retain them, and have them graduate prepared for gainful employment. Taught from a systems thinking perspective, examines the multifold ways to consider cost and academic effectiveness. Emphasizes the use of data for decision making, along with policies, practices, and strategies needed to improve an institution's academic reputation and, ultimately, graduation rates.
EDU 6225. Capstone. 4 Hours. 
Offers students an opportunity to reflect on concentration-specific work, considering their development as scholars, practitioners, and leaders in the field of education. Requires students to demonstrate mastery of content through practicum or a significant project adapted to the professional requirements of each concentration. After a thorough process of feedback and revision, students are required to present their final ePortfolios in a public forum to showcase their work and demonstrate achievement of program competencies.

EDU 6230. Program Evaluation and Assessment. 4 Hours. 
Offers students an opportunity to learn how to establish goals based on measurable outcomes, how to set benchmarks for performance measurement, and how to demonstrate the impact of a program on an organization's bottom line. Program evaluation and assessment is critical to quality assurance and continuous improvement. Mechanisms that demonstrate value added are also important to organizations that sponsor training and development efforts. Examines issues related to accreditation and other academic program reviews. This is a capstone course that offers students an opportunity to design and conduct an approved research project.

EDU 6235. Applications Project. 4 Hours. 
Offers students an opportunity to build competency related to their specific objectives by applying concepts learned in foundation courses to the particular type of organization they work within or the job function in which they expect to apply their knowledge.

EDU 6240. Instructional Technology. 4 Hours. 
Explores ways in which to leverage technology to support both online and on-ground classes. Instructional technology has largely become synonymous with distance learning, but even online technology can substantially enhance on-ground classes. As students have become increasingly comfortable with newer technologies, they have also come to expect technology utilization in their curriculum. Topics include streaming audio, streaming video, platform selection, effective layout, visual considerations, accessibility, and emerging technology.

EDU 6250. Employer Relations. 3 Hours. 
Examines workforce development programs from the employer's perspective. Discusses the idea and practice of dual customer service delivery. Offers students an opportunity to learn how to create an employer strategy based on population, goals, services, and economic context. Explores methodology on providing employers with return on investment for hiring and methods to demonstrate added value.

EDU 6251. Strategic Planning, Program Design, and Implementation. 3 Hours. 
Designed to provide hands-on tools and the underlying concepts related to building and operating a quality workforce development program. Offers students an opportunity to learn how to select target populations for a program, set attainable and valuable program outcomes, and grapple with challenges of career-path employment for entry-level workers. Explores strategic positioning and planning, program design considerations and theory, challenges in program startup, and issues regarding implementation. Students are expected to complete individual course projects, one of which may be to design a new workforce program for their respective employers.

EDU 6252. Work with Participants. 3 Hours. 
Provides an overview of the approaches to working with participants in workforce development programs. Topics include assessment tools and techniques, the importance of developing both soft skills and job-related skills, case management models, resources for getting participants ready for work, developing skills competency standards, retention strategies, and overall management of the process of working with participants.

EDU 6253. Understanding Labor Markets. 3 Hours. 
offers a comprehensive microeconomic approach to neoclassical wage theory and the theory of labor markets. Focuses on labor supply, household production, marginal productivity, human capital, and research. Examines alternative labor market theories, including the efficiency wage theory and the dual labor market theory. Offers students an opportunity to learn how to conduct local and regional labor market analysis as part of developing a workforce development strategy.

EDU 6254. Research and Evaluation. 3 Hours. 
Examines quantitative and qualitative research methods with regard to their applicability to social services and other nonprofit programs. Covers experimental designs but emphasizes quasi-experimental designs and links evaluation questions to data analysis techniques. These approaches include observation, surveys, structured and unstructured interviews, and document analysis. Topics include the following types of evaluation: process (formative), outcome (summative), impact and needs assessments, cost-benefit analysis, and performance monitoring. Uses case studies and hands-on exercises.

EDU 6255. Workforce Development Policy. 3 Hours. 
Reviews the national and state history of workforce policy. Examines the socioeconomic and political causes of policy shifts, as these have occurred over time. Analyzes current policy as well as reviewing best policy practices in the current economic context.

EDU 6256. Impact of Technology on Higher Education. 3 Hours. 
Examines technology's societal, educational, administrative, and security implications for higher education. Technology in society, and therefore in higher education, is rapidly evolving, creating a gap between student expectations and faculty and administrative utilization. Offers students an opportunity to debate how technology both strengthens and weakens teaching and learning, learn how to make informative (and cost-effective) technology-implementation decisions, understand the impact technology makes on business processes, examine the effect of new and emerging technologies, and become familiar with security requirements.

EDU 6257. Special Topics in Urban Education. 4 Hours. 
Explores the politics of bilingual and ESL education options in urban schools and the process and approaches to bilingual and ESL education in the school and classroom. Focuses on the identification of race and class-based issues related to special education testing, assessment, and pedagogy. Requires students to conduct class observation and interviews with teachers, administrators, and community leaders.

EDU 6270. Special Topics in Urban Education. 4 Hours. 
Explores the politics of bilingual and ESL education options in urban schools and the process and approaches to bilingual and ESL education in the school and classroom. Focuses on the identification of race and class-based issues related to special education testing, assessment, and pedagogy. Requires students to conduct class observation and interviews with teachers, administrators, and community leaders.

EDU 6271. Understanding the Financial Landscape of Education. 3 Hours. 
Investigates the different revenue sources of not-for-profit colleges and universities: public support, tuition, philanthropy, fees for service, research, endowment interest, sports revenue, grants, etc. Begins by recognizing that colleges and universities are ultimately dependent, as in any organization, on financial resources to operate. Where do institutions of higher education get their funding? What do they do with the financial resources they have? Particularly addresses the many complexities and common restrictions involved in financial management, funds allocation and use, and when and if financial exigency is necessary.
EDU 6275. Urban Education in Social Context. 4 Hours.
Focuses on questions such as what makes urban education different from or the same as K–12 education in suburban and rural America; what is the relationship of the local community to urban schools; how do local and municipal politics impact the urban school and classroom environment; and how do poverty and privilege intersect in the urban classroom? Centers on a systems approach to urban education. Explores the intersection of the education systems with other related systems—from the local and municipal sociopolitical systems to the urban family systems that interact with urban schools.

EDU 6280. Urban Education Elective. 4 Hours.
Encourages students to choose one additional course from the other discipline course offerings in the MED program. For example, teachers may want to take a course in the reading, writing, and literacy or math concentration to explore the specific applications of that discipline in urban education. Education administrators may want to take a course in the education leadership or adult and organizational learning concentration.

EDU 6285. Urban Education Project Seminar. 4 Hours.
Explores critical issues that impact the urban education environment. Offers students an opportunity to identify their particular critical questions based on their professional perspective as teacher or administrator and to identify their specific action research topic. Requires students to prepare a research proposal and, once complete, to present the proposal to the class.

EDU 6290. Portfolio and Panel Review. 4 Hours.
Explores critical issues that impact the urban education environment. Offers students an opportunity to identify their particular critical questions based on their professional perspective as teacher or administrator and to identify their specific action research topic. Requires students to prepare a research proposal and, once complete, to present the proposal to the class.

EDU 6300. Introduction to Language and Linguistics. 4 Hours.
Explores the foundations of language and linguistics. Discusses theories of the origins of language and compares reading and writing systems of English and other languages. Offers students an opportunity to learn phonology (how sounds are produced), how English works in patterns (linguistics and phonetics), how meaning is conveyed (semantics), and how languages are used (pragmatics). Seeks to provide a foundation for courses related to teaching English as a second language.

EDU 6302. Teaching, Learning, and Assessment: How English Is Learned and Used. 4 Hours.
Focuses on how languages are learned using technology and assessed with and without technology. Explores theories and methods for teaching grammar, listening, speaking, composition, reading, pronunciation, vocabulary, and integrated skills. Offers students an opportunity to develop an informed, explicit understanding of second-language learning and assessment through reading, theory, and practice.

EDU 6305. Sheltering Content Instruction, TESOL Beginnings/ESL/EFL Skills Lab. 2 Hours.
Offers students an opportunity to observe lesson demonstrations and practice theories and techniques on real ESL/EFL students. Students are observed by their instructors and peers.

EDU 6308. Designing and Managing an ESL/EFL Classroom. 3 Hours.
offers students an opportunity to learn how to plan lessons, design activities, assess learners, and become familiar with techniques for promoting interaction, providing feedback, utilizing textbooks, developing one’s own materials, dealing with mixed-ability-level groups, and incorporating strategy training in lessons to better manage a classroom. Demonstrates formal and informal assessment methods for both receptive and productive skills and explores strategies used for addressing student errors in the classroom. Examines the levels of English-language proficiency and their benchmarks, as described by the State of Massachusetts.

EDU 6310. Literacy Development and the Academic Domains. 4 Hours.
Offers students an opportunity to learn how to adapt their instruction to the language needs of the students in their classes. Reading, writing, speaking, and listening are the keys to academic success for students for whom English is not the first language. It is critical to understand the research about early literacy development, vocabulary development, process writing, peer editing, comprehension and metacognition, content reading, and literacy assessment. Students read the research, discuss the theory behind the research findings, and have an opportunity to learn how to apply those findings to the unique content and skill challenges they will face as classroom teachers.

EDU 6312. TESOL Practicum and Seminar. 5 Hours.
Focuses on learning how to plan lessons, design activities, and assess English-language learners. Offers students an opportunity to become familiar with techniques for promoting interaction, providing feedback, utilizing textbooks and other materials, developing one’s own materials, dealing with mixed-ability-level groups, and incorporating strategy training in lessons to better manage a classroom. Demonstrates formal and informal assessment methods for both receptive and productive skills, and explores strategies used for addressing student errors in the classroom. Students observe and report on an ESL class/program and develop a syllabus for an ESL class of their choosing. Provides a field-based assessment of teaching performance.

EDU 6319. How People Learn. 4 Hours.
Introduces the research and science of learning, integrating theory with case studies about learning principles and high-impact practices. Learning takes place in all stages of life: teenagers who go directly from high school to college, adults who “stop out” and return to school after years of work or family commitments, and even retirees who pursue learning made possible by expanded leisure time. Some education takes place formally within higher education; other opportunities are informal, sponsored by organizations such as museums and libraries or available for free online. Focuses on learning in online and mobile environments.

EDU 6320. New Technologies and Emerging Trends for Distance Learning. 3 Hours.
Focuses on the state of the art in today’s distance education, including theory and technology of distance education. Introduces emerging trends and concepts for the future of distance learning. Offers students an opportunity to learn about what types of infrastructures are needed to support online learning. Areas of focus include creative applications of technology for staff and faculty development and training, library, academic and student support services, open source utilization and partnerships, peer learning, and self-teaching paradigms. Serves as a distance learning primer and road map for educators. Should be taken as the first course in the certificate program.
EDU 6321. Models for Learning Design. 4 Hours.
Offers an orientation to learning design as art and science. Design has the capacity to support or detract from learning and, therefore, the design process itself needs to be intentional and evidence driven. Participants experiment with putting learning principles and high-impact practices into action within online and mobile learning scenarios. Investigates the many settings in which learning design takes place and considers the interplay between context and design methodology.

EDU 6322. Iterative Design of Learning Experiences. 4 Hours.
Offers students an opportunity to develop and teach an online minicourse that is designed to yield evidence of learning. Considers outcomes-oriented design, purposeful organization, facilitation, and embedded feedback. Learning is an iterative cycle and the same holds true for teaching. If reflection and evidence gathering are integrated into the process, each learning experience builds upon and influences the next. This course takes a studio approach to course creation. After running the course for their classmates, participants have an opportunity to use peer feedback and learning evidence to refine and improve their minicourses.

EDU 6323. Technology as a Medium for Learning. 4 Hours.
Investigates the role that technology can play in transforming the learning experience. Emphasizes interactive approaches that increase learner access, persistence, and engagement and designs that yield evidence of learning. In addition to investigating research relevant to media design, such as visual-auditory processing, cognitive load, and universal design, the course introduces protocols for aligning technology strategy with learning goals and learner needs. Offers students an opportunity to experiment with a suite of emerging technologies and then to develop an online, media-rich learning environment.

EDU 6324. Competencies, Assessment, and Learning Analytics. 4 Hours.
Analyzes the intended outcomes of education, how we will know if we’ve made a difference, and what we can do to improve learning along the way. These hard but important questions are at the heart of learning design. The act of assessment verifies that learning has taken place, but it also provides opportunities for refining plans and improving student learning. Some strategies are easily implemented, while others require advanced expertise. Covers recent advances in technology that make it possible to gather a wealth of data on how people interact within the environments in which they learn, recording each click of the mouse. In education, the use of this data to improve learning is referred to as “learning analytics.”.

EDU 6325. Teaching Strategies in E-Learning. 3 Hours.
Focuses on new technologies and trends in distance learning for innovative teaching practices. Offers students an opportunity to explore in detail how emerging technologies are being applied in online student- and faculty-support systems and models, needs assessments, student evaluation and assessment, integration of new technologies in courses, and scalable design and development of online courses.

EDU 6326. Adult Learning Theory for Distance Learning. 3 Hours.
Covers concepts and approaches for lifelong learning activities in the adult distance learning student population. Explores the social and psychological aspects of adult development and learning, including the various motivations of adult learners. Offers students an opportunity to examine methods of teaching and development and instructional best practices in this environment.

EDU 6327. Innovative Management of Distance Learning Program. 3 Hours.
Focuses on assessing the needs of a distance learning program and developing strategies to meet those needs. Offers students an opportunity to learn about management systems (LMS) and portals, electronic learner support systems, administration and budgeting, course support, training, marketing and promotion, copyright laws, and other policy issues related to distance programs.

EDU 6328. Policy and Leadership. 4 Hours.
Designed to engage students in systems thinking, specifically about how education policies at the federal and state levels impact teaching and learning in elementary and secondary schools. Studies the fundamentals of how policy is created and implemented and analyzes the ways in which competing visions of the purpose of public education frame policy debates and outcomes. Focuses on a variety of contemporary policy initiatives. Offers students an opportunity to evaluate the effectiveness of specific policies that relate closely to their professional roles and to seek to identify and practice the skills educators need in order to assume leadership roles in directly and indirectly influencing policy.

EDU 6329. Connecting Theory and Practice. 4 Hours.
Involves participants in ePortfolio-based reflection regarding professional goals, progress toward program- and concentration-level competencies, and opportunities for connecting theory and practice. Investigates the “integrative knowledge” approach to evidence-based learning, reflection, and professional identity development. With input and feedback from peers, faculty, and the student’s professional environment, participants then have an opportunity to develop a plan for experiential learning. The plan describes a three-to-five-month workplace-based, scholar-practitioner experience that is responsive to the needs of the employer, yet also steeped in the contemporary issues, science, and theory of learning design.

EDU 6330. Digital Media Literacy. 4 Hours.
Addresses how K–12 educators learn and use digital media literacy to prepare students for the world of tomorrow. Introduces students to innovative teaching and assessment practices as well as theoretical and philosophical orientations around participatory culture and literacies. Examines the interrelationships between cultural competencies, traditional literacy, research skills, technological skills, and critical thinking skills. Explores the role of ethics, authentic assessments of student learning, and differentiation of instruction in K–12 contexts. Requires graduate students to demonstrate advanced levels of study, application, and research.

EDU 6331. E-Learning Design as a Collaborative Profession. 4 Hours.
Explores the process of working with others to identify strategic directions about an institution’s vision for the future, investment of resources, and distinctiveness; to benefit from multiple perspectives and sets of expertise, such as educators, technologists, and institutional researchers; and to respond constructively to conflicting visions and interests. Online and mobile learning is a complex venture. At the program level, key players collaborate on the development of curricula that often need to be vetted at many levels of the institution. E-learning designers often play a critical role in the project management of program and course development. Offers students an opportunity to consider their individual strengths and growth areas as collaborators.
EDU 6332. Open Learning. 4 Hours.
Investigates the history, philosophy, and theoretical perspectives of open learning. While face-to-face classrooms have physical limits on how many people can attend, millions of people can access the same materials at the same time using online and mobile environments. Early innovators on the Web proclaimed that “information wants to be free.” This perspective is the heart and soul of open learning, whose mission often includes global and affordable access to education. Analyzes whether an open approach is appropriate for the learning scenario, the strategy for sustainability, if the learning experience is equally viable across cultural and economic demographics. Takes a case-study approach that investigates and critically analyzes open learning exemplars. Expects students to design and develop an open learning experience.

EDU 6333. Social Media and Beyond. 4 Hours.
Explores pedagogically sound practices for using social media to improve learning. Learning is enhanced when course participants have an opportunity to forge communities of interest, leveraging collaborative relationships to expand and deepen inquiry. When deftly designed and implemented, social media can increase the engagement of learners and the impact of an experience. Offers participants an opportunity to experiment with a range of social media applications.

EDU 6337. Instructional Technology. 4 Hours.
Examines the ways in which technology can enhance the teaching process and the learning experience in K–12 classrooms.

EDU 6340. Learning Analytics Concepts and Theories. 4 Hours.
Offers students an opportunity to learn about diverse perspectives in the field of learning analytics—including learning analytics assumptions, theories, epistemologies, and debates—in order to understand this emerging field. Explores distinctions among educational data mining, learning analytics, and big data, as well as their relationships to data analytics. Discusses key ethical, practical, and cultural challenges to the effective and appropriate use of learning analytics. Expects students to demonstrate their understanding of learning analytics concepts and theories through the development of a learning analytics philosophy statement.

EDU 6341. Introduction to Data Mining in Education. 4 Hours.
Offers an overview of educational data mining, data preparation, and the fundamentals of using data mining software. Using the Cross-Industry Standard Process for Data Mining (CRISP-DM) methodology, illustrates the principles and practice of data mining. The course structure follows the stages of a typical data mining project, from reading data, to data exploration, data transformation, modeling, and effective interpretation of results. Offers training in the basics of how to read, explore, and manipulate data with data mining software and then create and use successful models. Expects students to demonstrate their educational data mining skills through a hands-on final project.

EDU 6342. Data Preparation for Learning Analytics. 4 Hours.
Builds on skills covered in EDU 6341. Offers students an opportunity to learn to prepare data and build the final data set for predictive modeling, to develop skills necessary to extract and understand data elements, to transform data formats, and to derive new relationships among them. The final deliverable from the student in this course is a fully processed data set compatible for building predictive models that can be used to improve student learning and educational outcomes.

EDU 6343. Predictive Modeling for Learning Analytics. 4 Hours.
Offers students an opportunity to learn how to develop models to predict categorical and continuous outcomes, using such techniques as neural networks, decision trees, logistic regression, support vector machines, and Bayesian network models. Reviews expert options for each modeling node in detail and advises when and how to use each model. A hands-on final project offers students experience implementing predictive models.

EDU 6344. Data Visualization for Learning Analytics. 4 Hours.
Studies how to synthesize the technical components of data analysis into reports, presentations, and visual dashboards that are meaningful for the intended audience and deliver those components in a coherent, convincing format. In addition to gathering and interpreting data, today’s educational environment requires the ability to communicate the results of data analysis to a variety of audiences. Expects students to produce a sample research report as a culminating project.

EDU 6345. Text Mining for Learning Analytics. 4 Hours.
Offers students an opportunity to learn practical techniques for mining unstructured text data (such as that found in learning management system discussion boards, social media, student assignments, survey data, etc.) for the purpose of creating predictive models or reports based in part on text data. A hands-on final project offers students experience implementing text mining techniques.

EDU 6407. Essentials of Multimedia for Distance Learning. 3 Hours.
Covers fundamentals and best practices for designing, developing, and delivering engaging, interactive educational content over the Web. Offers students an opportunity to use selected multimedia tools and applications to design multimedia projects that demonstrate effective distance learning for adults.

EDU 6408. Evaluation and Assessment for Distance Learning. 3 Hours.
Focuses on evaluating the effectiveness of training, course design, and overall program design in adult distance learning. Covers Kirkpatrick’s four levels of evaluation, designing evaluation instruments, collecting data, and interpreting evaluation results. Offers students an opportunity to learn how to use feedback to implement change and continuous improvement in distance learning programs.

EDU 6409. Legal and Intellectual Property Issues for Distance Learning. 3 Hours.
Focuses on the use and delivery of intellectual property and the Internet. Examines in detail fundamentals of the TEACH Act, fair-use policies, methods for obtaining permission for use of intellectual property, recommended guidelines for use of intellectual property, and best practices to establish usage policies. Uses case studies to examine well-known issues and resolutions.

EDU 6425. Special Education: Role of Special Educators in an Inclusive School. 4 Hours.
Designed to enable teachers to plan for the broad and varied range of student learning and behavior and build a foundation for inclusive schools. Offers students an opportunity to understand the policies and regulations in special education, the role of the special educator in writing and implementing individual education plans (IEPs); the responsibility of special educators to create partnerships with families; and the role of the special educator in working within the school on curriculum across disciplines, service delivery for students with IEPs, and co-teaching models. Explores high- and low-tech assistive technology options and its integration into practice and the facilitation of principles of universal design. Using a case-study approach offers students an opportunity to analyze and problem-solve scenarios derived from field experience.
EDU 6426. Developmental Language, Literacy, and Writing: Assessment and Instruction. 4 Hours.
Introduces fundamental theoretical instructional principles of developing oral and written language, reading, writing, and language arts skills. Offers students an opportunity to learn about materials, instructional strategies, and classroom-based assessment for literacy development and instruction and empowering both elementary and secondary readers. Links a focus on early literacy acquisition with clinical assessment and questions regarding English-language learners and students with mild-to-moderate learning disabilities and variations.

EDU 6427. Differentiated Assessment and Instruction. 2-4 Hours.
Examines formal and informal assessment measures, including the interpretation of educational and psychological testing, curriculum-based assessment, classroom assessments, and their implications for instruction. Offers students an opportunity to translate results of norm-referenced assessments and curriculum-based assessment into goals for intervention and effective instructional strategies, as well as to learn how to understand the limitations of assessments and to develop the skills to design authentic and meaningful assessment that reflects student learning and drives instruction.

EDU 6429. Variations in Child and Adolescent Development. 4 Hours.
Reviews the biological, neuropsychological, psychosocial, cognitive, behavioral, and ecological theories of development. Examines variations and progress in the developmental domains and the intersection among these domains in development and learning in terms of disability and language differences within these theoretical perspectives. The impact of culture on development is infused throughout. Introduces assessments and interventions in development and learning.

EDU 6431. Developing Skills and Accessing Ideas: Curriculum. 4 Hours.
Examines questions in ways designed to ensure that educators are better able to help all students access the curriculum consonant with state and local frameworks and the students’ specific learning and developmental needs. A major challenge facing inclusive, general, and special education teachers is “implementing inclusive practices in a standards-based environment.” Seeks to answer how educators can begin to address the diverse learning needs of their students and how curriculum design can embody the flexibility necessary to accommodate students with learning and behavioral variations and difficulties.

EDU 6432. Reading Processes: Theory into Practice. 4 Hours.
Studies current research on reading development and instruction and their links to classroom practice. Explores literature in reading topics including language, phonics, vocabulary, and comprehension. Offers in-service teachers an opportunity to build on their experiences in their own classrooms as they consider and apply relevant research to their own practices. Issues facing English-language learners in reading development are threaded throughout the course.

EDU 6433. Writing Processes: Theory into Practice. 4 Hours.
Analyzes current research on writing development and instruction and its link to classroom practice. Explores literature in writing topics, including process writing in a variety of genres, phonics, spelling, and mechanics. Offers in-service teachers an opportunity to build on their experiences in their own classroom as they consider and apply relevant research to their own practices. Issues facing English-language learners in writing development are threaded throughout the course.

EDU 6436. Best Practices for the 21st-Century Education. 4 Hours.
Focuses on the twenty-first-century classroom, a heterogeneous community with a wide variety of student strengths, needs, and cultural experiences. Explores the philosophical and theoretical foundations of curriculum development and instruction across the disciplines in K–12 classrooms with a focus on utilizing the advantages and richness of this diversity. Examines the best pedagogical practices for meeting the needs of diverse students through a variety of topics, including differentiation; the role of technology; establishing positive classroom environments, routines, practices; and the role of critical thinking at every level.

EDU 6437. Assessment in Education. 4 Hours.
Examines principles and practices in assessment for learning and assessment of learning. Assessment and evaluation take different forms depending on the setting, from preschool to graduate school and beyond, each presenting unique opportunities and challenges. Regardless of context, effective assessment serves more than one purpose: as a strategy for improving learning and as a means for verifying that learning has taken place. This course offers participants an opportunity to consider the assessment strategies that are most relevant to their specific educational contexts.

EDU 6438. Teachers as Curriculum Leaders. 4 Hours.
Explores how to translate curriculum development theory and vision into advocacy and action. Offers students an opportunity to develop a perspective and skills that allow them to be effective teacher-leaders in modifying curriculum across content areas, including math, science, history, and English-language arts. Seeks to prepare students to lead initiatives and projects, including those at the classroom, school, and district level. Examines state curriculum frameworks and other standards alignment and evaluation.

EDU 6445. Internationalization at Home: Concept and Application. 4 Hours.
Examines—through concepts and applications, methods, and structures—ways to create a vibrant international experience for students and educators with limited ability to travel. In our competitive global society, the opportunity to experience directly a different culture, language, food, and customs is paramount to being a global citizen. But what about the vast numbers of faculty and students worldwide who cannot take the time to travel or who do not have the funds to live abroad? Uses case studies and technology currently used for internationalization at home to examine the theoretical framework and current thinking on the concept. Offers students an opportunity to create a curriculum to apply internationalization at home to their educational setting.

EDU 6446. Nontraditional Learners: Administrative Implications and Strategies. 4 Hours.
Studies the impact upon academic and social structures as nontraditional students—adults completing undergraduate degrees or pursuing professional degrees, veterans, single parents, and traditionally underserved or immigrant populations—enroll in person and online at higher education institutions in greater numbers. Arriving with perspectives and requirements significantly dissimilar from those of the traditional 18- to 22-year-old student, this course examines implications upon financial and technical infrastructures, academic and support services, etc. Students are expected to research and critique the literature regarding these populations, globally, and to debate changes to existing programs and structures. The final project is the creation of postsecondary learning and administrative environments and/or policies resulting from the needs of these growing communities.
EDU 6447. The Demographics of Higher Education. 4 Hours.
Provides an up-to-the-minute analysis of who accesses postsecondary education in any of its forms, from certificate to technical to community college to the various types of four-year and graduate-level institutions. Examining changing demographics, the course evaluates societal, cultural, and vocational development needs of students from the 18- to 22-year-old traditional student to adults completing college or pursuing professional degrees. Addresses issues of access, readiness, affordability, persistence, and employment upon completion of the degree, with an eye toward designing programs and interventions that contribute to student success.

EDU 6450. The Globalization of Education. 4 Hours.
Emphasizes a global view of political structures, educational systems, workforce development, and issues of interest to the student and specific to the culture and region studied. Offers students an opportunity to deepen their global knowledge and understanding through intensive research by comparing and investigating systems and ideals, examining alternative solutions, and engaging in critical dialogue and debate. Students are expected to prepare and present a research paper on their work.

EDU 6452. Critical Scholarly Investigation: On Location. 4 Hours.
Offers a faculty-led experiential learning opportunity for graduate students to further investigate their research topic in the designated country or region. Offers students an opportunity to enhance their global perspective through exploring local resources, discussions and lectures with hosting institution faculty, meetings with experts in their field of research, and collaboration with other graduate students. Students are expected to present their research findings.

EDU 6462. Children's Literature. 4 Hours.
Examines literature for children and young adults. A consistent theme is the historical progression of literature and its reflection of and influence on society. Studies a wide range of children's literature from picture books to children's novels. Analyzes language, poetry, illustrations, mediums of art, and decisions that affect tone and mood.

EDU 6465. Critical and Creative Thinking. 4 Hours.
Explores critical and creative thinking, particularly the ways in which the two types of thinking operate together. Focuses on K–12 classrooms and how teachers can bring critical and creative thinking to the center of their curriculum and instruction. Approaches critical and creative thinking as skills that can improve through practice but remains mindful of the relationship between thinking skills and specific academic content. Offers participants an opportunity to examine theories and research involving critical thinking and creativity, engage in activities designed to help them become more familiar with their own ways of thinking, and design strategies for teaching critical thinking and creativity in their own classrooms.

EDU 6470. Empowering Struggling Readers and Writers. 4 Hours.
Offers an advanced course in reading that critically examines literacy programs and initiatives and how to use them effectively in the classroom. Offers students an opportunity to further investigate reading and writing across the curriculum; assess reading/writing skills; design appropriate support for diverse learners; and select and utilize children's and adolescent literature, trade books, and other print material to empower competent readers and writers.

EDU 6471. Integrating Technology for Differentiating Instruction and Improving Student Outcomes. 4 Hours.
Offers students an opportunity to learn how to design and modify curricula with technological support to meet the learning needs of all students, as well as opportunities to plan instruction that integrates technology in a way that engages students and extends learning, while creating an inclusive environment for students with special needs. Many schools purchase low- and high-tech assistive devices and software programs, but teachers need to be prepared to integrate these resources into the curriculum.

EDU 6472. Advanced Special Education Strategies. 4 Hours.
Designed for practicing special educators and graduate students completing teacher/special education licensure programs. Uses cutting-edge research to explore advanced topics in special education. Modules include assistive technology, special education law, autism spectrum disorders, severe disabilities, neuroscience, and legal and data-driven individualized education plan (IEP) development.

EDU 6473. Different Brains, Different Learners: How to Reach the Hard to Teach. 4 Hours.
Offers both special and general educators an opportunity to learn, with the use of powerful tools, techniques, strategies, and approaches, how to assist students with disabilities to achieve their potential. Some of the disabilities addressed are oppositional defiant disorder, attention deficit disorder, dyslexia, hyperactivity, depression, and auditory processing disorder.

EDU 6475. Ethical and Legal Complexities of Special Education. 4 Hours.
Reviews case briefings, case law, and due process hearing decisions to provide guidance for education professionals on how to prepare for a due process hearing or mediation/fair hearing and how to develop a “cue book” for testifying, surviving examination and/or cross examination, and avoiding legal pitfalls that may result from giving testimony. Teachers and administrators encounter ethical and legal dilemmas in special education practice. Uses case studies to explore practical applications, legal mandates, critical issues, and ethical special education practices utilizing guidelines of the Council of Exceptional Children (CEC) and the American Psychological Association (APA).

EDU 6481. Inquiry in Reading and Writing across the Content Area. 4 Hours.
Explores ways in which reading and writing instruction and development extend across the curriculum and enhance student understanding and exploration of their world. Offers in-service teachers an opportunity to build on their experiences in their own classrooms as they consider and apply a range of instructional practices appropriate for different disciplines, while also seeing the commonalities across disciplines.

EDU 6483. Empowering Struggling Readers and Writers. 4 Hours.
Offers educators a conceptual framework and practical strategies for reaching the diverse learners in their classes. Suggests assessment procedures, grounded in an understanding that literacy learning is influenced by cultural and linguistic experiences, to offer teachers an opportunity to identify effective and practical ways to differentiate instruction within the mainstream classroom. Also offers opportunities to explore specialized resources and approaches.

EDU 6484. The Power of Literature for Children and Youth—Literature and the Arts. 2 Hours.
Examines selected illustrated texts to offer teachers an opportunity to learn how to integrate the aesthetics of music, art, and literature while engaging their students in critical exploration of seminal themes of racism and equity, justice, and survival.
EDU 6502. Best Practices in Early Childhood Education. 2-6 Hours.
Explores best practices for high-quality early childhood education, as defined by the National Association for the Education of Young Children accreditation criteria. Focuses on the following key standards for quality early education: teaching, relationships, curriculum and assessment, classroom and school environment, and family and community engagement. Offers students an opportunity to learn about the content and rationale for accreditation standards in each of these five areas, to develop a portfolio to document high-quality practices in one of these standards, and to reflect on their own teaching practices and consider ways to implement the best-practices standards in their classrooms and schools.

EDU 6503. Institute in Educational Leadership. 6 Hours.
Offers students an opportunity to gain a broad understanding of the role of the school principal within a school environment that extends beyond the traditional institutionally based program, as well as to identify and analyze content, curriculum, and instruction in the light of current research; to identify problems and design and implement solutions to such problems; to evaluate and field-test various curriculum approaches; to apply new knowledge and skills to classroom practice; and to gain the knowledge, skill, and expertise to become school leaders. This program leads to certification in school administration.

EDU 6504. Institute in Educational Leadership. 6 Hours.
Offers students an opportunity to gain a broad understanding of the role of the school principal within a school environment that extends beyond the traditional institutionally based program. Provides students with the opportunity to identify and analyze topics such as content, curriculum, and instruction in the light of current research; to identify problems and design and implement solutions to such problems; to evaluate and field-test various curriculum approaches; and to apply new knowledge and skills to classroom practice, with the goal of obtaining the knowledge, skill, and expertise to become school leaders.

EDU 6505. Institute in Educational Leadership. 6 Hours.
Offers students an opportunity to gain a broad understanding of the role of the school principal within a school environment that extends beyond the traditional institutionally based program, as well as to identify and analyze content, curriculum, and instruction in the light of current research; to identify problems and design and implement solutions to such problems; to evaluate and field-test various curriculum approaches; to apply new knowledge and skills to classroom practice; and to gain the knowledge, skill, and expertise to become school leaders. This program leads to certification in school administration.

EDU 6514. Survey of Content and Strategies for Teachers of ESL. 2 Hours.
Surveys content and teaching strategies for teachers of English as a second language. Explores strategies for listening and speaking, discussions on various topics, persuasive speaking, narrative, and conversation.

EDU 6515. Language and Learning Challenges. 4 Hours.
Offers students an opportunity to obtain an understanding of students with learning disabilities in the context of schooling for all children, many of whom may be in special education and inclusionary programs. Presents a developmental view of linguistic, cultural, cognitive, physical, and socioeconomic characteristics of learners who are labeled learning disabled or who have learning differences. Examines the causes and consequences of learning disabilities as differences in relation to neuroscience, language, and culture.

EDU 6516. Sheltered English Instruction and Assessment. 4 Hours.
Designed for students that are already familiar with the SIOP (Sheltered Instruction Observation Protocol) Model, the widely implemented research-based foundation for supporting the English-language learners in many current classrooms. With the switch to the rigor of Common Core and the focus on close reading and complex texts, this course seeks to deepen the practice of teachers to effectively plan and deliver lessons that meet this demand. Exposes students to even more strategies beyond the SIOP that are necessary to enable English-language learners to be successful with the Common Core State Standards.

EDU 6517. Foundations of Teaching English as a Second Language: Research and Practice. 4 Hours.
Reviews the basics of language acquisition theory and strategies for incorporating academic vocabulary into content instruction and assessment of language proficiency. Joins theory to practice by introducing students to current instructional research and practice and includes fieldwork. Offers participants an opportunity to begin to learn how to translate theory into practical strategies for teaching content in culturally sensitive ways using the Sheltered Instruction Observation Protocol (SIOP), World-Class Instructional Design and Assessment (WIDA) standards, and the Common Core. Every educator shares the responsibility for ensuring that students who are in the process of learning English have every opportunity to increase their understanding of the content. This requires understanding the cultural context of each student’s background and the level of their progress in English-language acquisition.

EDU 6520. Learning and the Brain: Translating Research into Practice. 4 Hours.
Introduces current, cutting-edge brain-related research and the implications for classroom practice. Draws upon research from neuroscience, psychology, and education to investigate the following topics as they relate to the brain and learning: anatomy, research-based strategies that are effective for students with learning disabilities, current research in the underlying causes of learning disabilities, learning to read, influencing behavior, and future areas of exploration.

EDU 6528. Adaptive Learning/Behavior Management Strategies: Consultation and Collaboration. 4 Hours.
Seeks to extend participants’ competence in theory, research, and practice pertaining to creating a sense of classroom community, family engagement, and school culture. Examines behavior management approaches and offers participants an opportunity to develop practical interventions and skills for preventing, intervening, andremediating behavior problems. Participants also have an opportunity to apply inclusive principles to the classroom, examine student issues and learning needs, and analyze delivery models to consider how to impact participants’ teaching, classroom, and school.

EDU 6530. Beyond Behavior Management. 4 Hours.
Offers students an opportunity to move beyond the rudimentary "management of behaviors" and examine teaching rooted in clearly defined expectations and logical consequences, teaching that helps foster communal responsibility, self-discipline, and self-determination for students with disabilities and their "typical" peers. Contains a sustained examination of specific programs (i.e., Assertive Discipline, Tribes, the Responsive Classroom) and observational and problem-solving tools.
EDU 6534. Bilingualism, Second Language, and Literacy Development. 4 Hours.
Introduces second-language acquisition (SLA) and bilingualism. Studies how learners create a new language system, frequently with only limited exposure. Covers the debates in the field whose main claim is that second-language acquisition is dynamic and nonlinear. Addresses how native language facilitates or impedes SLA, the universal processes affecting SLA, the challenges advanced second-language learners encounter in higher education, and the question of identity transformation. Emphasizes the components of language structure and their relevance to language learning and literacy; issues in culture, language socialization, and cognitive processes in language acquisition; variability of language learners; and language learners in academic context. Some of the major disciplines that contribute to SLA include theoretical linguistics, psychology, anthropology, conversation analysis, and sociology.

EDU 6535. Introduction to Instructional Technology. 2 Hours.
Offers students an opportunity to refine their technology skills as they relate to teaching and learning in the classroom or lab. Provides an introduction to how computers can best support classroom instruction.

EDU 6536. Integrating Technology into the Curriculum. 4 Hours.
Explores research and implementation of strategies for effective integration of technology into the curriculum.

EDU 6537. Learning Theory and Instructional Design Strategies. 2 Hours.
Explores the differences between key learning theories and their effective use in the design of accessible learning activities.

EDU 6538. Assessment Elementary. 2-4 Hours.
Examines the methods and materials related to formal and informal assessment, analysis, and interpretation of the results of assessment to inform effective instruction for students at the elementary level. Focuses on the needs of students from varied populations, including English-language learners.

EDU 6539. Assessment Secondary. 2-4 Hours.
Examines the methods and materials related to formal and informal assessment, analysis, and interpretation of the results of assessment to inform effective instruction for students at the secondary level. Focuses on the needs of students from varied populations, including English-language learners.

EDU 6540. Nuts and Bolts of IT: Hardware, Software, and Maintenance. 2 Hours.
Offers students an opportunity to learn the basics of computer hardware, software, networks, and simple maintenance; how to install upgrades to the operating system; about networks and their variety of uses in an educational setting; and basic troubleshooting tips and techniques for both Macintosh and PC computers. Students work both singly and in small groups to install hardware and software.

EDU 6542. Online Learning. 2 Hours.
Covers the research and implementation of strategies for effectively integrating online resources as well as computer-based CD-ROM reference materials into the curriculum. Explores employing optimal search strategies using popular search engines such as Google, Alta Vista, Yahoo, Magellan, and Lycos to find resources. Offers students an opportunity to learn how to create Web quests and resource-rich Web pages for use in projects and presentations, as well as to learn to use Web authoring tools to develop home pages linked to curriculum and community resources.

EDU 6543. Designing Effective Professional Development Models. 4 Hours.
Offers students an opportunity to research effective models of professional development. Students work in groups investigating common principles of effective professional development programs incorporating the latest research on addressing students’ learning styles and share their results with the class. Using these principles, each team then designs an activity, including an evaluation component, to address a common need they have identified in their school districts.

EDU 6544. Principles of Curriculum Development. 2 Hours.
Explores effective models of curriculum design used in a variety of school districts around the country. Offers students an opportunity to design instruction utilizing effective curricular and assessment strategies.

EDU 6545. Designing Model Technology Plans. 2 Hours.
Examines model technology plans and the role of technology as a facilitator of meaningful reform in the teaching-learning process. Students work in groups to research, design, and share assessment instruments to determine a district’s hardware, software, networking, staffing, and professional development needs. They also work in groups to create and present a model technology plan based on research-based models of technology use tied to state frameworks and local curriculum goals.

EDU 6547. Developing Effective Policy and Management Strategies. 2 Hours.
Explores and analyzes the politics of K–12 education at the local, state, and federal levels. The political realities of the community in which schools sit, the municipal system of education, and state and national education policy priorities impact local schools and classrooms. Emphasizes such contemporary issues as school choice, standardized testing, the influence of political interest groups, and urban school reform policy. Offers students an opportunity to explore and develop the skills and strategies necessary to equip students with the vision and impetus to be transformative social change agents.

EDU 6548. Universal Design of Curriculum. 2 Hours.
Offers students an opportunity to develop K–12 curriculum and teaching strategies sensitive to all learners, especially students in regular classrooms with high-incidence disabilities such as mild cognitive and fine motor difficulties or ADHD. Universal classrooms use digital media to mold existing and emerging curriculum materials and approaches to teaching, making it more responsive to the needs of diverse learners. Using school-based case studies, students work in cooperative groups during class time to identify and address barriers to students’ learning. Requires students to complete a final project focused on the strengths and limitations of one new digital technology based on a literature review and an investigation of a school-based implementation.

EDU 6549. Research Seminar: Investigating Critical Issues in Education. 2 Hours.
Considers and analyzes a range of critical issues confronting educators today from the perspective of what is known about how they impact teaching and learning in the classroom. Students are asked to select one of these issues to research in greater depth and to report on as it relates to their professional practice. Requires students to gather, evaluate, critique, and interpret the collected data to support their examination of the issue in question.
EDU 6551. Historical Context of School Leadership and Change. 4 Hours. Includes past and present metaphors of the principalship, reflecting societal, political, and economic contexts and influences; school-change theories and history, including the work of Tyack and Cuban, Senge, Sizer, Payne; and reviews of responses to “A Nation at Risk” and the standards movement. Asks participants to conduct an analysis of their school district cultures and place efforts in which they have participated in the context of larger school-change efforts.

EDU 6552. Leadership, Voice, and Theory. 4 Hours. Reflects a variety of thinking and research about leadership and organizational development across educational, political, and business contexts. Includes the work of Sergiovanni, Evans, Fullan, Depree, Bolman and Deal, and Meier among others. Encourages participants to use their school experiences to access key conversations, planning, and decision making across the topics explored in the course. Expects participants to independently research and analyze additional theorists and scholars in the domain of leadership whose ideas offer applicability and relevance, as well as to seek out and diagnose current examples in practice via case studies, educational publications, and news articles.

EDU 6553. Operations/Systems, School Development, and Public Engagement. 4 Hours. Covers school-based management and budgeting, including prioritizing for cuts and/or surplus, safety planning, staffing and organization, interviewing and outplacement, use of public and private funds, fund-raising and partnership development, and public relations and communications. Encourages students to use their district-based internships to access key conversations, planning, and decision making across the topics listed above and include in their portfolio observations, reflections, and key questions about their specific contexts.

EDU 6554. Teaching and Learning. 4 Hours. Centers on the development of routines and habits, core knowledge, and skills of the effective and committed principal as an instructional leader. Readings include the work of Barth, Donaldson, Shmoker, Sizer, Dufour, Tatum, Hilliard, and Saphier. Examines field notes and observations, district supervision and evaluation instruments and practices, and staff conversations to offer the aspiring leader an opportunity to develop a level of comfort and expertise in supervising and supporting teachers in their instructional responsibilities. Emphasizes understanding key observational practices, substantiating claims with evidence, and developing a cogent vocabulary with which to understand and express key aspects of pedagogy and assessment.

EDU 6555. Principal as Instructional Leader. 4 Hours. Centers on the development of routines and habits, core knowledge, and skills of the effective and committed principal as an instructional leader. Readings include the work of Barth, Donaldson, Schmoker, Sizer, Dufour, Tatum, Hilliard, and Saphier. Examines field notes and observations, district supervision and evaluation instruments and practices, and staff conversations in an effort to assist the aspiring leader to develop a level of comfort and expertise in supervising and supporting teachers in their instructional responsibilities. Emphasizes understanding key observational practices, substantiating claims with evidence, and then developing a cogent vocabulary with which to understand and express key aspects of pedagogy and assessment.

EDU 6556. Educational Leadership: Creating a Culture for Learning. 2 Hours. Explores the acquisition and application of the theories and practices needed to redefine educational accountability within an integrated system that includes leadership, teaching, and curriculum for student achievement; to abandon initiatives that are ineffective, obsolete, and superfluous; and to develop the skills to evaluate, coach, and develop future leaders. Also explores identifying and solving difficult instructional and learning problems.

EDU 6557. Curriculum Leadership. 2 Hours. Offers students an opportunity to explore strategies for framing curriculum-related problems and planning curriculum changes. Major topics include the relationship between standards-based education and previous curriculum traditions and theories; student, teacher, and school factors that influence curriculum experiences; the differences between contrived and genuine collaboration for curriculum planning and curriculum improvement; the use of assessment and data to improve curriculum and learning.

EDU 6558. Issues in Education. 1-4 Hours. Offers students an opportunity to explore in-depth a current educational issue, long-standing unresolved educational problem, and/or ways of considering innovation and change in education. The topic alternates each time the course is offered, and students are allowed to enroll each time the focus of the course changes. May be repeated up to 15 times for up to 16 total credits.

EDU 6559. Differentiated Instruction and Assessment in Mathematics. 4 Hours. Focuses on the development of individualized intervention programs for children and youth in need of special education. Offers students an opportunity to translate results of norm-referenced diagnostic assessments and curriculum-based or criterion-referenced assessments into goals for intervention and effective instructional strategies. Explores the use of data to differentiate mathematics and other instruction. Offers students an opportunity to learn the limitations of assessments and to develop informal classroom-based assessments that reflect student learning and drive instruction.
EDU 6570. Advanced Strategies in Literacy: Readers and Writers Who Struggle. 4 Hours.
Focuses on the complex challenges faced by children and youth who struggle (or fail) to achieve measurable success in reading and writing. Considers teaching and learning environments, variations in language, learning, and cognitive styles and development. Examines cultural expectations and student motivation, as well as an array of instructional and assessment approaches and measures. Offers students an opportunity to learn how to describe and analyze the difficulties encountered by struggling readers and writers and to identify and evaluate a range of appropriate strategies to address those difficulties.

EDU 6574. Mentoring in Action: Instructional Coaching for Educators. 4 Hours.
Seeks to advance effective teaching practices that enhance student learning through mentoring protocols. The instructor uses an interactive, reflective approach that highlights practical strategies, readings, and research that can be adapted for all grade levels. Topics include observation and feedback techniques, quality conversations for busy educators, strategies for group mentoring, and organizing a new teacher support program. Presents a month-by-month curriculum for supporting effective teaching practices. Emphasizes conversations related to student learning. Course objectives are aligned with the Department of Elementary and Secondary Education (DESE) Guidelines. Participants also have an opportunity to learn how to implement effective mentoring protocols that retain qualified teachers. Materials are appropriate for mentor teachers, coaches, department chairs, and administrators.

EDU 6579. Second-Language Learning and Teaching. 2 Hours.
Designed to meet the Massachusetts DOE category 1 requirements for teachers of LEP students. Offers students an opportunity to explore key factors affecting second-language acquisition, the implications for classroom instruction, the cultural aspects of instruction, and ways to modify instruction to meet student needs.

EDU 6580. Teaching Reading to Limited English Proficiency Students. 3 Hours.
Designed to meet the Massachusetts DOE category 4 requirements for teachers of LEP students. Offers students an opportunity to explore the basic concepts of linguistic theory and practice for developing reading skills; strategies and practices for developing reading skills and for teaching vocabulary; initial reading instruction; knowledge of performance criteria; and the scoring system used in the MEPA.

EDU 6581. New Technologies and Emerging Trends for Online Learning in the Secondary Classroom. 3,4 Hours.
Offers an intensive course to serve as a road map to introduce educators to new technologies and emerging trends for the design and delivery of online learning in a secondary school environment. Explores the theory and practice for effective online delivery, introduces various curriculum models that support online learning, examines the tools and technologies used to support these emerging models, and studies creative approaches to effective teaching and learning in online environments. Offers students an opportunity to become familiar with the fundamentals and best practices for online learning in a secondary school, to obtain a common vocabulary of terms related to online learning, and to be prepared to participate in the subsequent courses in this program.

EDU 6582. Best Practices for School-Based Online Teaching and Learning. 3,4 Hours.
Investigates strategies and best practices for teaching fully online and hybrid courses in secondary classroom environments. Explores the fundamental elements of effective classroom instruction and work to clarify how these elements apply to teaching online. Through reading, listening, writing, and viewing, offers students an opportunity to immerse themselves in a variety of effective online learning activities for secondary students. Group work and reflective exercises provide opportunities to critically examine how specific instructional strategies may be applied to support teaching.

EDU 6583. Innovative Management of Online Learning in Secondary Schools. 3,4 Hours.
Focuses on the identification and assessment of online learning programs in secondary classrooms. Using case studies, offers students an opportunity to examine emerging trends and significant research in online learning and to become familiar with effective approaches to managing and deploying online programs. Presents strategies for developing successful online programs and identifying learning management systems (LMS) and portals for delivery. Exposes students to best practices for successful online learner-support systems, effective administration and budgeting practices, training and support frameworks for teachers, as well as intellectual property guidelines for faculty and students and other policy issues related to online programs.

EDU 6584. Evaluation and Assessment of Online Courses in Secondary Classroom Environments. 3,4 Hours.
Focuses on the effectiveness of online courses and programs in secondary classroom environments. Offers students an opportunity to learn how to establish key metrics and build systems to capture performance data that demonstrate competencies for online course outcomes that determine effectiveness in comparison with traditional face-to-face offerings as well as to explore best practices for formative and summative assessments of learning outcomes in the online classroom and demonstrate competencies. Explores early formative assessment approaches and warning systems to resolve gaps in student achievement. Subjects covered include Kirkpatrick’s four levels of evaluation, designing evaluation instruments, collecting data, and interpreting evaluation results. Students also have an opportunity to learn how to use feedback to implement change and continuous improvement in online courses and programs.

EDU 6585. Essentials of Multimedia for Teaching and Learning in Secondary Classrooms. 3,4 Hours.
Focuses on selection and implementation of emerging multimedia and Web-based tools for effective teaching and learning in secondary online educational environments. Explores strategies for identifying appropriate tools and technologies for the online classroom, facilitating online learning, and delivering educational applications and activities over the Web or within a technology-enhanced learning environment. Offers students an opportunity to use selected multimedia tools and applications to design projects and evaluate multimedia that demonstrate effective technology-mediated learning for secondary education settings. Examines case studies of successful emergent examples for deploying and using multimedia in secondary classrooms nationally.
EDU 6586. Legal and Intellectual Property Issues for Online Learning in Secondary Classrooms. 3.4 Hours.
Focuses on ways to ensure legal and appropriate use and delivery of intellectual property over the Internet for the purpose of teaching and learning in secondary classroom environments. Explores current standards and emerging trends for protecting intellectual property in online classrooms and for adopting recognized best practices for legal use of intellectual property according to the TEACH Act, fair-use doctrine, and Digital Millennium Copyright Act (DMCA). Offers students an opportunity to examine the use of intellectual property and to learn about strategies for copyright compliance as well as to examine a range of timely and high-impact issues and challenges and to identify possible resolutions to those issues.

EDU 6587. Using Data to Enhance Student Achievement. 4 Hours.
Explores how to use data more effectively. Examines ways of collecting and analyzing data. Expands common notions of data beyond grades and test scores to include more subtle forms of data such as classroom observations and environmental surveys. Educators are increasingly surrounded by data. However, studying educational data does not automatically lead to school improvement or student success. Encourages participants to provide their own data for this work, though this is not a requirement. Participants then have an opportunity to use these data sets to create a richer understanding of schools, students, and the many ways the participants can strive toward social justice as educators.

EDU 6588. Integrated Teaching Through the Arts. 4 Hours.
Introduces teachers to the value of integrating the arts modalities into the everyday curriculum by providing teachers with strategies that can be used immediately in their classes. Explores activities that appeal to the multiple intelligences through participation, readings, discussions, and presentations.

EDU 6589. Evidence-Based Practice for School Counselors. 4 Hours.
Offers students an opportunity to explore the elements of evidence-based practice, examine different research-based curricula, and discuss the unique position of counselors as agents of positive change for schools and students and how to negotiate and collaborate to realize those changes. School counselors must now demonstrate how their work results in measurable student outcomes in academic, social/emotional, and career domains.

EDU 6590. Making Schools Safe: Addressing Harassment, Bullying. 4 Hours.
Explores the increasingly serious problems of bullying, harassment, and hate crimes in the schools and cyberspace, as well as the laws governing appropriate responses to these problems. Examines the impact of school climate on learning and student achievement and the most common mistakes and issues contributing to major school conflicts, incidents of violence, and racial and other forms of intergroup tensions. Offers students an opportunity to examine how to assess, prevent, and respond to bullying and harassment.

EDU 6591. Integrating Poetry and Drama across the Curriculum. 4 Hours.
Encourages participants to tap into their creativity through the medium of dramatic and poetic arts. Seeks to enable them to engage students, deepen learning, foster innovation, and make interdisciplinary connections to the curriculum and goals of state standards. Designed for teachers of all grades and disciplines.

EDU 6592. The Critical Mind: Inspiring Interdisciplinary Thinking in American Humanities. 4 Hours.
Seeks to enable teachers to transform American literature and history courses or units into inclusive interdisciplinary humanities models. Using the prevailing philosophy and ideas of each historical era as a paradigm, the course examines examples of literature, history, music, art, architecture, and archetypal American heroes as depicted in classic American films. Participants are encouraged to engage in classroom discussions, breakout sessions to share new possibilities for interdisciplinary lesson plans, and activities that enhance curriculum content.

EDU 6593. Supporting Traumatized Children in the Least Restrictive Environment. 4 Hours.
Examines the necessary supports for children with trauma histories to become successful in school. Explores strategies for restructuring academic content, the application of therapeutic and behavioral interventions for positive supports, ways to ensure a safe school environment, and activities to build the social and interpersonal skills of traumatized children. Also reviews family dynamics and stressors related to parenting a child with trauma, along with information on accessing available supports.

EDU 6594. Directed Study: Education Policy Development. 4 Hours.
Designed to provide, in a directed study format, instruction leading to better understanding about education policy development; implementation; and implications at the local, state, and national levels. Provides participants with current research and articles and requires them to develop and present a product that focuses on an aspect of policy presented in the materials as it applies to the current education climate.

EDU 6595. Systems, Policies, and School Governance. 6 Hours.
Examines theories of organizational systems and change, the impact of school policies on school culture and academic success, and school governance all under the common vision of equity and excellence. Special topics include school budgets, special education, and school law. Examines theories of instructional and curriculum leadership. Offers students an opportunity to connect instruction, curriculum, and assessment as they relate to systems, policies, and governance and to demonstrate their developing leadership skills through a presentation to a panel of educators.

EDU 6596. Instructional Leadership. 6 Hours.
Examines theories of instructional and curriculum leadership, child development, and family and community engagement. Special topics include issues related to English-language learners. Addresses connections between instruction, curriculum, and assessment. Explores the following questions: What is great teaching and why does it matter? How do I lead teachers to agree on a set of (research-based) teaching practices and implement these consistently schoolwide, promoting equity and excellence for all students?

EDU 6597. Supervision and Evaluation. 6 Hours.
Examines theories of supervision and evaluation and explores what is great teaching and why it matters. Also examines the following questions: How do I bring consistency into school practices? How do I evaluate teaching while developing, supporting, and sustaining great teaching in the school? How do I lead for equity? Offers students an opportunity to develop a portfolio of their yearlong learning as an aspiring principal to give evidence of their competency in all areas required by the Massachusetts Department of Elementary and Secondary Education.
EDU 6598. Strategies for Effective Classroom Management. 4 Hours.
Offers an interactive course designed to provide educators with the best practices for effective classroom management. Offers participants an opportunity to learn specific strategies on how to establish a productive classroom climate, effectively support students with special learning and behavioral needs, and apply learned techniques and interventions to real-life classroom situations. Examines how to create a learning community that encourages positive social interaction, active engagement, and increased self-regulation for all students.

EDU 6599. Comprehensive Case Management for the Special Education Classroom. 4 Hours.
Surveys the unique roles and responsibilities of the special educator as case manager. The overview includes advocacy for students as they develop greater levels of independence and self-directed learning behaviors. Emphasizes liaison competencies through effective communication systems between and among stakeholders in school, home, community, and outside agencies. Explores transition planning, implementation of individualized education plans (IEPs), and the role as team leader. Offers participants an opportunity to develop an understanding of the various systems for collecting and using data to inform instruction and to develop effective program continuums for students with disabilities. Establishes and discusses the legal responsibilities of case management throughout the course.

EDU 6601. Integrating the Visual Arts into the Elementary Classroom. 4 Hours.
Introduces students to effective strategies for integrating works of art into classroom learning, with a particular emphasis on using art to help students develop critical thinking and literacy skills. A powerful form of communication and expression, engagement with art brings possibilities for wonder and connection into the classroom. Such experiences inspire creative thinking and reinforce that capacity for creativity that is inherent to us all. Furthermore, artworks provide unique opportunities for differentiated instruction.

EDU 6602. Using Graphic Design as a Teaching Tool for the K–12 Classroom. 4 Hours.
Explores how to integrate visual presentations, posters, timelines, and diagrams into classroom practice. Offers participants an opportunity to learn what it means to “think like a graphic designer.” The language of graphic design lives in the classroom. Through presentation, dialogue, hands-on work, and critique, participants explore curriculum content and practices and assess non-text-based student work. Designed to support those in nonart content areas across the disciplines, including teachers of English-language learners and special education. No technology or art skill is required.

EDU 6604. Cross-Cultural Awareness: Successful Cultural Contact in the Classroom. 4 Hours.
Explores the realm of culture: What are our own cultural values and assumptions? How do they affect our awareness of and interaction with people from different cultures? Discusses the role that one’s culture plays in cognitive processes, communication, decision making, and problem solving. Works toward developing a blueprint for tuning one’s skills to the cultural values of a diverse student population.

EDU 6606. Building Reading Comprehension and Vocabulary Skills. 4 Hours.
Explores reading instruction with an intensive focus on improving reading comprehension skills, building students’ vocabulary, and providing strategies that support students in answering open response questions. Designed to be directly linked to the classroom instruction. Topics include implementation and use of guided reading and literature circles, developing inferential thinking skills, and bringing vocabulary development into daily classroom instruction. Participants are asked to draw on their experiences as classroom teachers and are expected to implement learned strategies into their classroom practice.

EDU 6610. Debates in American Educational History. 4 Hours.
Offers current and future professionals working in education-related fields an overview of the debates concerning the purposes of schooling in the United States. From the creation of a common school system, the expansion of schooling during Reconstruction, and the reforms spawned by progressive education, to the report "A Nation at Risk" and the No Child Left Behind legislation, examines the major debates about the purpose of schools. Also examines the current debates about standards, high-stakes testing, vouchers, and charter schools. Seeks to provide a strong foundation for current and future professional practice. Offers students an opportunity to shape the course—and their participation in it—to connect to their own intellectual interests and professional goals.

EDU 6611. Access and Inclusion: Strategies for Teaching Diverse Learners. 3 Hours.
Focuses on access and inclusion and the strategies for teaching diverse learners. Topics include identifying a particular learning community and the needs of that community, using theory in practice, the application of assessment, goal setting, intervention strategies, and evaluation in the classroom and school. Explores issues of advocacy and equity of student groups.

EDU 6612. Legal Issues in Special Education. 4 Hours.
Examines the historical, legal, and ethical perspectives of educational services for learners with special needs. Offers participants an opportunity to understand the legal background, including the constitutional and statutory basis for understanding legal issues, in special education. Emphasizes these issues as they apply in Massachusetts. Reviews court and administrative decisions, exemplary programs, relevant current literature, and the development and implementation of an Individualized Education Plan (IEP).

EDU 6613. Closing the Achievement Gap: Instructional Talk in a Teacher Team. 4 Hours.
Designed to guide teachers in developing and reflecting on their practice as members of a team. Topics include improving student learning, enhancing inclusion strategies, new teacher support, and developing peer coaching relationships. Focuses on issues related to the "achievement gap" and how instructional talk in a team can affect teaching and learning.

EDU 6614. Balanced Literacy. 4 Hours.
Explores ways that teachers, grades K–8, can incorporate the use of literature circles and guided reading into classroom instruction. Includes the core instructional techniques of guiding reading and literature circles as well as the effective use of assessment to enhance literacy instruction and evaluate effectiveness. Discusses the art of discussion, grouping, text selection, direct instruction of comprehension, scaffolding instruction, assessment, and curriculum management.
EDU 6615. Behavioral Interventions for Special Populations—Principles and Procedures. 4 Hours.
Introduces the principals of learning theory and how to apply empirically valid behavioral-based interventions in order to improve socially significant behaviors. Course content relates specifically to those individuals with developmental disabilities who attend public and collaborative special education classrooms. Offers students an opportunity to learn about the basic principles of behavior and how to apply them in order to increase, reduce, or promote the generalization and maintenance of behavior.

EDU 6616. Behavioral Interventions for Special Populations—Practical Applications. 4 Hours.
Explores evidence-based behavioral interventions and methodologies used to teach new skills and reduce interfering behaviors for students with developmental disabilities. Emphasizes the application of these strategies within public school and collaborative settings. Encourages students to move from theory to practice by participating in a variety of hands-on and real-life activities. Offers students an opportunity to develop the skills necessary in order to write measurable goals and objectives, develop specific treatment and behavioral intervention plans, define and measure behavior, and record and interpret data.

EDU 6620. Politics of Education. 4 Hours.
Designed to explore and analyze the politics of K–12 urban education at the local, state, and federal levels. Urban public schools operate in a political context. Within the schools, there is a web of political relationships that define curriculum, classroom management, and collegial interactions. In the political realities of the community, the municipal system of education and state and national education policy priorities impact local urban schools in both blatant and subtle ways. Emphasizes contemporary issues such as school choice, standardized testing, influence of political interest groups, and urban school reform policy. Offers students an opportunity to explore and develop the skills and strategies necessary to obtain the vision and impetus to be transformative social change agents in urban education.

EDU 6621. Educational Leadership 1. 6 Hours.
Offers students an opportunity to engage in study and practical experiences designed to prepare them for the role of school principal. Includes the development of skills and understandings related to leadership development, communication, and school culture. Introduces effective leadership skills including organizational characteristics of schools, school climate, and techniques for facilitating institutional change; team building, consensus building, and group decision-making skills; and principles and techniques of effective human resource management.

EDU 6622. Educational Leadership 2. 5 Hours.
Introduces aspiring school principals to the examination of effective practices and tools for planning, implementing, evaluating, and revising school priorities, procedures, and programs. Examines effective instructional practices; issues relating to leading and motivating staff, including effective management strategies; supervision and evaluation of instructional programs and data-driven decision making for the improvement of teaching and learning; and fiscal management and budget administration. Explores federal, state, and municipal laws and regulations governing school management.

EDU 6623. Educational Leadership 3. 5 Hours.
Offers students an opportunity to engage in study and practical experiences designed to prepare them for the role of school principal with particular emphasis on an exploration of appropriate instructional methods and on student assessment. Covers issues relating to curriculum development, including scope, sequence, and program evaluation; understanding and use of principles, practices, and recent research for effective teaching, learning, and curriculum development; understanding of human development and learning of children and adults; and understanding theories and methods of program evaluation. Also addresses the culture and climate of the school.

EDU 6624. Educational Leadership 4. 5 Hours.
Designed for the preparation of school leaders. Explores strategies concerning school operation, parent involvement, and the wider community. Topics include understanding societal change; the process of policy formation at the local, state, and federal levels and how to effectively use the political process for school change; and the historical and political backgrounds of the major gender, racial, ethnic, religious, and cultural groups in a school district. Discusses the results of contemporary research as it relates to the delivery of effective services for students with special needs. Students are expected to develop their own personal professional development plan.

EDU 6625. Educational Leadership Seminar. 3 Hours.
Offers students an opportunity to explore effective communication; interpersonal attitudes and skills; personnel management and labor relations, including conflict resolution, mediation, and negotiation; and the culture and climate of the school.

EDU 6626. Positive Behavior Support for At-Risk Students: Strategies and Interventions. 2 Hours.
Builds from knowledge about functional behavioral assessments. Reviews research and best practices for providing additional support for students who are at risk for developing serious or chronic problem behavior. Explores various programs and specialized group interventions that emphasize prevention and teaching with emphasis on developing and implementing behavior management plans.

EDU 6627. Implementing Effective Classroom and Schoolwide Behavior Support for All Students. 2 Hours.
Examines patterns of problem behavior and findings through a systems approach. Explores ways to design and implement classroom and schoolwide supports to create a positive, inclusive school culture and climate. Discusses problem-solving strategies with the understanding that each school has its own unique characteristics and that there is no universal approach to establishing effective behavior supports.

Introduces functional behavioral assessment (FBA) and its use as a tool to support behavior management initiatives in the special education classroom. Examines evidence-based strategies for conducting an FBA and strategies to effectively use the results to design and implement positive behavior support plans.
EDU 6630. Educational Leadership—Creating a Culture for Learning. 3 Hours.
Designed to assist aspiring principals to (a) rethink and redefine school leadership so that the job is doable and (b) redesign their schools so that virtually all students achieve high levels of proficiency. Students engage in text-based discussions designed to help them identify and assess the contextual factors in which they work that influence their leadership practice, foster the improvement of teaching and learning, and produce results, as well as those that inhibit the improvement of teaching and learning. Analyzes strategies for building an infrastructure that promotes collective inquiry, teamwork, and distributive leadership. Offers students an opportunity to learn how to implement a leadership framework to guide, direct, and support the schoolwide, continuous improvement of standards-based teaching and learning and the conditions in which they occur.

EDU 6631. Curriculum Leadership. 3 Hours.
Offers participants an opportunity to learn strategies for framing curriculum-related problems and planning curriculum changes. Major topics include the relationship between standards-based education and previous curriculum traditions and theories; student, teacher, and school factors that influence curriculum experiences; the differences between contrived and genuine collaboration for curriculum planning and curriculum improvement; and the use of assessment and data to improve curriculum and learning.

EDU 6632. Inclusive Elementary Schools: Curriculum, Instruction in Mathematics, and Other Disciplines. 2.4 Hours.
Designed to engage students in understanding the big ideas of elementary subject matter while examining state standards and curriculum frameworks. Major components include knowledge and application of instruction in mathematics and the use of instructional programs from students’ districts. Offers students an opportunity to design units of study incorporating math and other subject areas with differentiated lessons and assessments.

EDU 6633. Inclusive Secondary Schools: Curriculum, Instruction in the Disciplines. 2.4 Hours.
Designed to engage students in understanding the big ideas of secondary subject matter while examining state standards and curriculum frameworks. Major components include knowledge and application of instructional strategies for each discipline. Offers students an opportunity to design units of study incorporating curriculum frameworks, differentiated lessons, and assessments.

EDU 6635. Building School Capacity for Providing Behavioral Health Services. 4 Hours.
Designed for school health professionals. Offers an opportunity to explore topics related to children and adolescents with mental and behavioral issues. Addresses the basic competencies needed to provide mental and behavioral health services in the school environment, including awareness of prevention strategies and knowledge of a variety of mental health disorders. Covers information about partnering with families, school personnel, and community mental health specialists to assess, plan, and provide care, including the use of interpersonal communication skills to meet the needs of students.

Offers the first seminar in the series, designed to provide participants with both the conceptual framework for their leadership development work and two intensive workshops in key areas: (a) school law and (b) leadership in special education. This seminar is launched with an institute orientation where opportunities for team building and for mapping the year’s activities are presented. During this seminar, mentors and district-based personnel assist the aspiring leader in identifying key projects and activities to frame the practicum content. This intensive workshop features knowledgeable presenters in their respective areas, key readings, and activities and protocols that seek to enable participants to deepen their understanding of leadership challenges and practice-based dilemmas.

EDU 6641. Seminar Series: Excellence in School Leadership 2. 1 Hour.
Offers the second seminar in the series, designed to provide participants with both the conceptual framework for their leadership development work and the first in two intensive workshops in instructional leadership. Focuses on the establishment of a knowledge base and daily routines that support leaders in their supervision and evaluation of teachers and in establishing a positive, goal-oriented culture. Introduces key readings, activities, and protocols that seek to enable participants to deepen their understanding of leadership challenges and practice-based dilemmas in instructional leadership.

Offers the third and concluding seminar in the series, designed to provide participants with both the conceptual framework for their leadership development work and the last of the intensive workshops in instructional leadership. Features knowledgeable presenters in their respective areas, key readings, and activities and protocols that seek to enable participants to deepen their understanding of leadership challenges and practice-based dilemmas in instructional leadership. Emphasizes the use of field notes, claims, and evidence and working with teachers in key domains of practice.

EDU 6645. Adapting Secondary Curriculum for the Online Delivery. 3 Hours.
Designed for classroom teachers. Focuses on the adaptation of secondary school curriculum to an online delivery format using best practices and proven methodologies. Offers participants an opportunity to demonstrate prior learning in the design of their own online courses based on the practical application of the theory explored in earlier courses. They also have an opportunity to adapt guidelines for competency-based teaching and learning to their online delivery and to apply a variety of learning accessories designed to meet the needs of online learners in a high school setting.

EDU 6646. Establishing a Student Support Framework. 3 Hours.
Focuses on establishing a framework for implementing online programs in a secondary school setting to ensure high-quality teaching and learning, faculty and student satisfaction, and demonstrated student success. Designed to help participants identify strategies that include addressing student and faculty expectations for online teaching and learning, creating a community of learners, and setting up a student support structure such as peer coaching, academic advising, technical support, and working in study groups. Seeks to familiarize participants with proven strategies and best practices for developing student support services for online learners at the secondary school level.
EDU 6648. Writing Instruction for Effective Communication. 4 Hours.
Focuses on instructional practices that teachers can use to support students as they develop their writing skills. Presents participants with ways to integrate the components of writing, the writing process, writing in the content area, and the different modes and genres of writing. New learning tools include learning strategies, instructional methods and materials, and evaluation techniques. Offers participants an opportunity to demonstrate their knowledge of the reading-writing connection. The course also addresses research and practice relative to the principles of teaching writing.

EDU 6655. Enhancing Clinical Skills and Empowering School Nurses. 3 Hours.
Designed to meet the clinical needs of K–12 school nurses. Topics include school-wide issues such as nutrition fads, access to behavior and health resources, and ethical issues. Explores strategies for dealing with bullying, assessing anxiety, respiratory and trauma emergencies, and drug impairment issues. Participants are updated on the Department of Elementary and Secondary Education reporting requirements. Also provides participants with an opportunity to consider their role as the health leader in their school.

EDU 6656. Accountability in Public Education 1. 2 Hours.
Designed primarily for administrators responsible for running schools and school systems and for policy makers responsible for setting, overseeing, and evaluating the implementation of public policy in the field of education. Explores various approaches to public accountability in general and the history and current context of contemporary public education accountability, including increasing demands for public accountability, improved performance, and reform. Also examines concepts of performance measurement, ethics in accountability work, and current practice in educational accountability.

EDU 6657. Accountability in Public Education 2. 2 Hours.
Designed for administrators responsible for running schools and school systems and for policy makers responsible for setting, overseeing, and evaluating the implementation of public policy in the field of education. Offers participants an opportunity to explore the application of concepts studied in EDU 6656 in the context of State Frameworks for District and School Accountability. In addition, participants have an opportunity to examine and practice some of the specific knowledge and skills required to perform accountability reviews of the performance of schools or school districts. Includes process elements, assessment of personal attributes, case study, fieldwork, and simulation and role-playing.

EDU 6665. Best Practices for Serving Students with Severe Disabilities across School Settings. 4 Hours.
Explores some of the best practices in serving students with more complex academic and social needs, including those with physical, communication, developmental, and suspected intellectual impairments. Examines ways to increase access to high-quality academic and functional content through the use of universal and individually designed accommodations and modifications to both the explicit content as well as the embedded curriculum. Emphasizes the development of language systems, the use of aided language stimulation, and the functionality of core vocabulary. Reviews the current application of pragmatically organized dynamic displays (PODD systems), focusing on the broader implications in the future. Addresses the development of literacy and numeracy skills through the review of instructional practices, systematically layered content, and effective accommodations.

EDU 6670. Understanding and Addressing Needs of Students with Social Cognitive Deficits. 4 Hours.
Offers a hands-on/interactive course designed to provide participants with a basis for understanding the social and cognitive deficits in students diagnosed with high-functioning autism, pervasive developmental disorder not otherwise specified (PDD-NOS), Asperger syndrome, nonverbal learning disability, and attention deficit hyperactivity disorder (ADHD), as well as the challenges these conditions present both in and out of the classroom. Analyzes social thinking as described in the work of Michelle Garcia Winner. Offers participants functional treatment strategies and an opportunity to better understand why these students react and respond the way they do. Examines available social skills assessment tools and resources designed to assist in developing and implementing social thinking curriculum. Also covers instruction in how to write individual education plan (IEP) goals and objectives.

EDU 6710. Understanding Autism Spectrum Disorders. 4 Hours.
Explores the unique characteristics of students with autism spectrum disorder (ASD), including impairments in language, social skills, sensory processing, and behavioral regulation. Offers detailed information on the current research and media trends in the following areas: diagnostic classification of autism, Asperger syndrome, Rett syndrome, childhood disintegrative disorder, and pervasive development disorder-NOS. Examines intervention strategies applicable to both regular and special education classrooms with particular emphasis on best practices and evidence-based interventions.

EDU 6866. Teaching Practicum and Seminar. 1-8 Hours.
Includes at least 300 hours of supervised student teaching in a public school system and reflection seminar. Provides a field-based assessment of teaching performance for students in one of the MAT programs. Requires prior successful completion of all Commonwealth of Massachusetts licensure prerequisites. May be repeated for up to 8 total credits.

EDU 6870. Teacher Candidate Practicum. 1 Hour.
Seeks to support the development of effective, culturally responsive teachers throughout the yearlong licensure program. Various components of this course are designed to be a conduit for ongoing reflection and refinement of practice, incorporating problem-solving strategies, examining assumptions, applying theory to practice, and analyzing student outcomes as a means of improving practice. A major goal is to create a collegial learning community that promotes honesty, reflection, risk taking, and intellectual rigor. Teacher practice is recorded, self- and peer-evaluated, and supervised by a licensed teacher.

EDU 6874. Practicum, Portfolio, and Panel Review. 4 Hours.
Contains both a portfolio requirement and a panel review in addition to a supervised practicum. The portfolio that is submitted includes work products demonstrating the competencies specified in the Professional Standards for Teachers. The review panel is composed of School of Education faculty members, a partner-school special educator/administrator, and community members. Requires students to present a video and/or portfolio in which they demonstrate competencies.

EDU 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

EDU 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EDU 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.
EDU 6966. Practicum. 1-4 Hours.
Omits students a field-based, supervised practicum in two levels of school—elementary, middle, and/or high school. Students are assigned responsibilities and keep the schedule of a full-time teacher. They have an opportunity to collaborate with their supervising practitioner as well as other professionals to infuse technology into instruction and practice. They also have an opportunity to work with the administrators at the schools to create and deliver a professional development workshop in instructional technology for their peers. Exposes students to guidance, IEPs, budgeting, long-term planning, and technology infrastructure. Offers students the opportunity to complete a professional portfolio on their own Web site for viewing by potential employers.

EDU 6970. Seminar. 1-4 Hours.
Integrates a seminar and laboratory format across courses throughout the program. Covers introductory diagnostic seminar, school-site meetings, mentoring, and the year-long team project.

EDU 6976. Directed Study. 3 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

EDU 6980. Interdisciplinary Capstone. 2 Hours.
Omits students an opportunity to act as reflective change agents as they apply the knowledge and skills gained from their individualized programs of study to the creation of a final project, an action research proposal. The proposal, presented to faculty and peers, identifies a workplace problem or need and includes an implementation plan to address it. Students also have an opportunity to reflect on their learning journey and to refine their original Professional Learning Plan (PLP) with a five-year focus.

EDU 6983. Topics. 1-4 Hours.
Covers special topics in education. May be repeated without limit.

EDU 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

EDU 7101. Analytical Thinking and Writing for Scholarship and Reflective Practice. 6 Hours.
Introduces the analytical, academic, writing, and research skills needed for successful completion of the doctoral degree. Reviews and outlines doctoral-level scholarship and applies critical-thinking methodologies to research and writing. Doctoral study involves a different approach to thinking and writing through critical analysis, synthesis of ideas and facts, and the use of theory in its relation to professional practice. Specific topics include understanding of critical and abstract thinking, intersecting theoretical frameworks with practice, argumentation development, and the conceptualization and organization of scholarly discourse. Students are expected to complete intensive writing assignments each week of the course.

EDU 7102. Augmentative and Alternative Communication within the Inclusion Setting. 4 Hours.
Omits students an opportunity to look at how augmentative and alternative communication systems can be used to support literacy, composition, and access to the curriculum through modified formats. Covers basic language development through alternative means, from very concrete representations to advanced computerized communication devices. Examines students with both moderate and severe disabilities who require a range of supports, including both high- and low-tech systems. Also addresses access issues related to physical, vision, and hearing impairments. Many of the techniques and strategies reviewed are useful for English-language learners as well as native speakers.

EDU 7103. Building a Healthy, Inclusive School Community. 2 Hours.
Focuses on effectively communicating and building positive relationships with students, parents, and colleagues, particularly in diverse schools and schools with changing demographics. Offers students an opportunity to learn to apply a model of interpersonal relationships that addresses development of biases and expectations that interfere with school climate, learning, and interpersonal effectiveness. Examines how the development of racial groupings and cliques undermines a school’s morale and functioning and what to do when this occurs.

EDU 7105. Advanced Topics in Elementary Literacy Development. 4 Hours.
Provides an overview of the reader’s and writer’s workshop models of instruction. Topics include running records, word study strategies for developing vocabulary, and guided reading instruction. Explores strategies for developing fluency and comprehension. In addition, offers students an opportunity to investigate the concepts of process and content writing, the writer’s notebook, using mentor texts for teaching the six traits of writing, and to analyze assessment tools and student work samples to inform the educator and ultimately drive instruction.

EDU 7115. Leadership and Vision. 6 Hours.
Omits students an opportunity to examine issues as they relate to theories of organizational development, leadership, school culture, and vision. Topics include why certain organizations and change efforts succeed; ways to implement successful strategies to transform schools and achieve goals of social justice and high achievement for all students that includes members of the school community; characteristics of a leader; how school leaders can keep students and their families at the center of the work; the role of the community in building schools, developing curriculum, and in the leadership model of the school.

EDU 7166. Body, Mind, and Meaning. 4 Hours.
Considers the interaction between experience, memory, imagery, and the body. Is the body experienced as a machine, as spirit made flesh, as manifestation of mind? Where is the mind located? Where is the body experienced? Ida Rolf taught that memories are in our muscles, and Candace Pert has found emotions in our bodies’ neuropeptides. Through theoretical readings and discussion, as well as experiential exercises, this course provides educators, body workers, and psychotherapists with an introduction to the field of somatic psychology.

EDU 7200. Social and Cultural Analysis of Education Systems. 3 Hours.
Presents institutional, cultural, and social dynamics of schooling, classroom management, school reform, and social group interactions, as well as individual role behaviors.

EDU 7201. Global and Historical Perspectives on Education. 3 Hours.
Provides a historical foundation for understanding how global educational trends of today have been informed by ideas and practices from the past. Compares seminal theories of teaching and learning, benchmarks in the evolution of schooling, and changing notions about the purposes of education cross-culturally over time. Offers students an opportunity to gain a more sophisticated perspective on today’s changing landscape in K–12 and higher education across the world.

EDU 7202. Transforming Human Systems. 3 Hours.
Focuses on the many challenges presented by today’s dynamic environment and examines change processes as they relate to various organizational settings. Emphasizes the usefulness of theory and research, in addition to management and leadership practice techniques, that facilitate effective change and transformation efforts. Underscores the planning process as it relates to institutional change and transformation. Offers students an opportunity to analyze both empirical research and case studies and to use theoretical research to examine real-world examples of change and transformation.
EDU 7203. Ethical Decision Making for Education Leaders. 3 Hours.
Considers the conflicts that can arise when pressures placed on educators and educational leaders, and the actions that result, are in conflict with the rights and well-being of teachers, learners, and their communities. Examines actions educational leaders have taken and the consequences they have faced when confronted with ethical dilemmas. Develops a personal model for ethical leadership from these examinations. Uses case studies and documents based on current events.

EDU 7204. Global and Historical Perspectives on Higher Education. 3 Hours.
Provides a historical foundation for understanding how current trends in higher education are informed by ideas and practices from the past. Compares seminal theories of teaching and learning, benchmarks in the evolution of higher education, and changing notions about the purposes of higher education cross-culturally over time. Offers students an opportunity to gain a more sophisticated perspective on today's changing landscape in higher education across the world.

EDU 7205. Research Processes. 3 Hours.
Introduces practice-based educational research. Drawing upon the reflective examination of their professional field conducted in previous courses, students are guided through the process of crafting good research questions to investigate problems of practice of their interest and explore the characteristics and possibilities of quantitative and qualitative approaches to the questions they crafted. Explores different types of research design specially suited to bridge research and practice (e.g., action research, case studies, evaluation studies, survey studies). Offers students an opportunity to identify the type of practice-based research that is most adequate to investigate their questions.

EDU 7208. Theoretical Foundations of Education Research and Practice. 3 Hours.
Introduces the role theoretical frameworks play in practice-based research. Covers foundational theories in educational research and how these theories have been used to understand problems of practice in varied K–12 and/or higher educational settings. Through the instructor's guidance, offers students an opportunity to begin to research and select a theoretical framework that best matches their own research interests. Students draft their own doctoral problem statement (DPS) as a culminating project for the course.

EDU 7209. Introduction to Doctoral Studies. 3 Hours.
Seeks to provide a foundation for further study in the Northeastern University Doctor of Education program. Examines doctoral studies, resources, philosophical issues, and basics of research. Offers students an opportunity to integrate theoretical and scholarly knowledge in the development of a researchable problem of practice.

EDU 7210. Leadership Theory and Research. 3 Hours.
Examines seminal works, contemporary theories and models, and emerging perspectives of educational leadership. Exposes students to the ways in which educational leadership has been conceptualized, explores how it is currently defined and analyzed, and discusses how it will be shaped in the future. Adopts a cross-disciplinary and integrative view of the leadership phenomenon that highlights how different disciplines inform leadership study and illustrates various research methodologies used for understanding and assessing the concept of leadership. Covers a range of leadership processes (e.g., individual, dyadic, group, organizational) along with theoretical perspectives (e.g., trait, behavioral, contingency, change and transformation).

EDU 7211. Public and Institutional Policy. 3 Hours.
Examines those issues that impact how education institutions operate and their effectiveness. Educational institutions operate in a political context. Within the schools there is a web of political relationships that define curriculum, classroom management, and collegial interactions. Outside the school, the political realities of the community in which education institutions sit and the municipal, state, and national education policy priorities impact the school. Emphasizes the skills and understanding necessary for education leaders to navigate and influence this political environment.

EDU 7212. Financial Decision Making for Education Leaders. 3 Hours.
Explores financial aspects of educational institutions with particular emphasis on the use of financial information for decision making. Specific topics include financial analysis, budget creation, and budget oversight. Examines both cost center and RCM models. Emphasizes using financial data for decisions related to resource allocation, forecasting, and other planning and control activities.

EDU 7213. Education Entrepreneurship. 3 Hours.
Examines entrepreneurship and innovation from the perspective of the educational leader and uses case studies to demonstrate entrepreneurial success within the education environment. Education leaders, whether in public or private institutions, need to be innovators, capable of facilitating, generating, and advancing new ideas and initiatives. Current and emerging challenges within the education environment require going beyond the solutions and leadership practices of the past.

EDU 7214. Changing Conceptions of Learning and Human Development: Research and Practice. 3 Hours.
Examines how interdisciplinary fields in the social sciences and the humanities provide frameworks for thinking about changing conceptions of learning and human development at the levels of the individual, the individual in relationship with others, and the individual in varied social contexts. Close examination of primary source readings offers students an opportunity to investigate the ways these ideas have influenced educational research and practice. Requires students to deeply reflect about how conceptions of learning and human development matter when designing and conducting their own doctoral research.

EDU 7215. Understanding Qualitative and Quantitative Research Data. 3 Hours.
Investigates further the assumptions that underlie quantitative and qualitative research approaches introduced in EDU 7205. Explores the tools and methods most commonly associated with different research approaches, the data that they produce, and the various processes used in analyzing different types of data. Also provides an introduction to research design by connecting research questions to methodology, methodology to methods, methods to the resulting data, and data to the appropriate analytical approaches. In preparation for the methodological component of the doctoral project proposal (DPP), offers students an opportunity to gain a clearer understanding of methodology and the different approaches that scholars have used to investigate their area of interest.

EDU 7216. Social Justice and Educational Equity. 3 Hours.
Explores how conceptions of justice and oppression have evolved in the United States. Offers students an opportunity to examine seminal texts, analyze contemporary educational research, and explore and analyze how social justice issues inform and contribute to problems of practice in contemporary educational contexts. Instructors employ a variety of pedagogical strategies to facilitate independent and collaborative learning.
EDU 7217. Educational Systems: The Dynamics between Policy, Values, and Practice. 3 Hours.
Offers students an opportunity to analyze education systems—macro to micro—using a wide array of resources and learning experiences. Public school systems have been shaped by numerous policies and legislated expectations as well as by political and social arguments, values, and beliefs. Many of these forces greatly affect the structures, organization, practices, and cultures of districts, schools, and classrooms today.

EDU 7220. Creating High-Performance Teams. 3 Hours.
Examines group dynamics and the techniques of leading teams, while offering students the opportunity to observe and practice leading team-based activities. Education institutions depend upon collaboration and team efforts to effectively fulfill their missions. Leading teams involves managing different personalities, cultures, conflicting political agendas, and varying skill levels, while simultaneously securing and managing resources and managing the expectations of other stakeholders.

EDU 7221. Negotiation, Mediation, and Arbitration. 3 Hours.
Introduces several of the techniques of dispute resolution, with application to both internal and external situations. Emphasizes human-resource-related disputes, including those related to disciplinary situations and collective bargaining agreements. Examines various options along with rubrics that can be used for decision making in the context of dispute resolution.

EDU 7222. Community Engagement. 3 Hours.
Defines and analyzes the multiple stakeholders that comprise the community and the many agendas that must be balanced and managed. Educational institutions at all levels are integral parts of the communities they reside in and serve. Education leaders must not only manage the relationship between their institutions and their communities, but they also need to be participants in the life of those communities. Examines specific examples of effective and ineffective community engagement, along with national and international trends.

EDU 7223. Communication Challenges for Education Leaders. 3 Hours.
Covers crisis communication, intercultural communication, and communicating with the media. Education leaders operate within extremely diverse environments, in which communication challenges frequently arise. In addition to internal challenges, education leaders must also be prepared to represent their institutions to the media, the general public, and government agencies.

EDU 7224. Doctoral Seminar in Education Leadership. 3 Hours.
Offers a special topics course that examines critical and timely issues challenging education leaders. Through individual consultations with the instructor and critical feedback from their peers, offers students an opportunity to focus their thesis arguments and articulate how their projects contribute to applied research in the field of education leadership.

EDU 7230. Current and Emerging Practice in STEM Education. 3 Hours.
Examines standards-based curricula in current use and under development in science, technology, engineering, and mathematics (STEM) education in grades K–12. Focuses on the capacity of these curricula to promote scientific literacy and facilitate conceptual understanding of scientific principles through guided inquiry and other modes of instruction. Explores curricula that develop and apply mathematical skills to solving significant scientific problems. Analyzes the fidelity of implementing these standards and their impact on student learning as measured by national and international tests, including TIMSS and PISA.

EDU 7231. National and International Benchmarks. 3 Hours.
Examines science, technology, engineering, and mathematics (STEM) education standards that have been set by national organizations, including the AAAS and National Academies, and by state agencies, including the Massachusetts DOE Curriculum Frameworks in Mathematics and in Science and Technology. Compares and contrasts the learning goals embedded in these standards with contents of standardized tests administered locally, nationally, and internationally. Explores how to help educators embrace collaborative globalizing in STEM education.

EDU 7232. Linking Theory and Practice through Partnerships. 3 Hours.
Examines the effectiveness of school-to-work, dual enrollment, summer bridge, after school, cyber learning, and other STEM education enhancements that are jointly administered by middle and high schools in concert with corporate, higher education, and other nonprofit partners. Uses case studies and a critical review of the literature to offer educators an opportunity to explore how such partnerships can lead to richer student learning and a better understanding of, and appreciation for, the contributions of STEM professionals.

EDU 7233. Knowledge and Critical Skill Integration. 3 Hours.
Examines international research and practices in the field of curriculum and instruction. The course’s theoretical framework serves as an overarching principles that run through all subject-based curricula. Examines both historical and contemporary case studies of how key components of curriculum leadership have been operationalized in various school settings.

EDU 7234. Doctoral Seminar in Curriculum Leadership. 3 Hours.
Examines the results of research on teaching and learning that probe the efficacy of “process” education as an approach to acquiring knowledge, developing high-order learning skills, and inspiring students to take ownership of their learning and growth.

EDU 7240. Curriculum Design and Dissemination. 3 Hours.
Examines theoretical and historical dimensions of the design and dissemination of curricula in K–12 educational settings. Examines overarching principles that run through all subject-based curricula. Examines both historical and contemporary case studies of how key components of curriculum leadership have been operationalized in various school settings.

EDU 7241. International Research and Practices in Curricula. 3 Hours.
Examines international research and practices in the field of curriculum and instruction. The course’s theoretical framework serves as an investigative lens into key tensions that have framed past and current-day developments in curriculum and instruction. Offers students an opportunity to explore each of these tensions in a variety of international educational settings. Working in collaborative teams, they then have an opportunity to build upon this knowledge to develop their own research and analysis of a case study in curriculum and instruction.

EDU 7242. Situated Leadership. 3 Hours.
Focuses on student reflections on the challenges and opportunities they face as educational leaders and change agents in contemporary educational settings. Is theory driven. Offers students an opportunity to investigate various theoretical frameworks and apply them to their various problems of practice; to investigate, gather, and synthesize empirical research articles that pertain to their particular areas of interest; to write cogent literature reviews detailing their analysis; and to present and debate their ideas with classmates.

EDU 7243. Doctoral Seminar in Curriculum Leadership. 3 Hours.
Offers a special topics course that examines critical and timely issues challenging curriculum leaders. Through individual consultations with the instructor and critical feedback from their peers, offers students an opportunity to explore these topics and discuss how they relate to applied research in the field of curriculum leadership.
EDU 7244. Curriculum Theory and Practice Over Time: Implications for Educational Leadership. 3 Hours.
Explores the theoretical and historical dimensions of curriculum, teaching, and learning in varied educational settings. Offers students an opportunity to learn about touchstone principles that have shaped the thinking and implementation of subject-based curricula over time. Uses historical and contemporary case studies to examine how educational leadership is intimately connected to the process of curriculum development, teaching, and learning.

EDU 7245. Urban Education. 3 Hours.
Focuses on the historical and contemporary challenges and possibilities that urban public schools face. Encourages students to consider the urban school from desegregation post—Brown vs. the Board of Education through current resegregation, high-stakes testing, and education reform. Through analysis and critical thinking, offers students an opportunity to create their own research-based plans to address a critical issue in urban schools.

EDU 7250. Organizational Systems and Institutional Governance. 3 Hours.
Examines the issues related to shared governance. Focuses on managing and leading in an environment of shared governance. Institutions of higher education are unlike any other kind of institutions in either the public or private sector. The difference is largely due to the concept and use of shared governance. Other topics include variations of shared governance and organizational structures.

EDU 7251. Student Engagement in Higher Education. 3 Hours.
Examines influential student development theories and theorists. The higher education sector in the United States and around the world is being transformed by competitive forces that require institutions to be market-driven. Analyzes the implications of work on enrollment management and students in a market-driven environment.

EDU 7252. Fundraising, Alumni, and Development. 3 Hours.
Focuses on activities related to foundations, alumni, grants, and donors. Higher education leaders must serve and lead many constituencies external to the institution. Examines specific development strategies, as well as development and relationship techniques and models.

EDU 7253. The Legal Environment of Higher Education. 3 Hours.
Examines the major laws that impact the decision making of higher education leaders and emphasizes strategies for navigating the legal environment and managing potential legal threats. Institutions of higher education operate in a complex legal environment that includes laws related to financial aid, admissions, licensure, and privacy.

EDU 7254. Postsecondary and Institutional Public Policy. 3 Hours.
Examines the political contexts within which institutions of higher education operate, including the influences of various interest groups—faculty, students, parents, community groups, alumni, trustees, and central administrators. Explores the additional factors affecting public institutions, including state and national education policy resource allocation priorities. Emphasizes development of the skills and understandings necessary for education leaders to navigate and manipulate a range of political environments.

EDU 7255. Innovation and Entrepreneurship in Higher Education. 3 Hours.
Examines entrepreneurship and innovation from the higher education perspective and uses case studies to examine the reasons for entrepreneurial successes and failures. Effective leaders of higher education institutions must be accomplished innovators, capable of facilitating, generating, and advancing new ideas and initiatives. Current and emerging challenges within the higher education environment require going beyond the solutions and leadership practices of the past.

EDU 7256. Financial Decision Making in Higher Education. 3 Hours.
Explores financial aspects of postsecondary educational institutions with particular emphasis on the use of financial information for decision making. Specific topics include financial analysis, budget creation, and budget oversight. Examines both cost-center and RCM models. Emphasizes using financial data for decisions related to resource allocation, forecasting, and other planning and control activities in higher education.

EDU 7257. The Urban University in the United States. 3 Hours.
Explores the development and special characteristics of the urban university in the United States. Includes an introductory session focused on the meaning of the term “urban university” and the societal importance of this type of institution, a sequence of historically oriented classes that explore the emergence and evolution of different types of urban universities from the late-nineteenth century to the present, a sequence of topically oriented classes that focus on various aspects of urban universities in terms of both their internal characteristics and their relationships with their surrounding communities, and a view of selected urban universities in the United States.

EDU 7258. Strategic Management in Higher Education. 3 Hours.
Examines strategic management from multiple conceptual and intellectual traditions. Focuses on the latest research and situates strategic management within the context of higher education.

EDU 7259. Doctoral Seminar in Higher Education Administration. 3 Hours.
Offers a special topics course that examines critical and timely issues challenging postsecondary leaders. Through individual consultations with the instructor and critical feedback from their peers, this course offers students an opportunity to explore these topics and discuss how they relate to applied research in the field of higher education administration.

EDU 7260. Comparative International/Global Higher Education. 3 Hours.
Examines the many educational systems that exist around the world, along with worldwide emerging trends in education. An understanding of these global models can better inform policy decisions, institutional strategies, and pedagogy at the micro- and macrolevels. Emphasizes topics of governance, credentialing, assessment, portability, funding, curriculum, and instruction. Examines current and emerging trends resulting from changing demographic and economic shifts, as well as varied reform initiatives.

EDU 7261. International Student Markets. 3 Hours.
Examines the characteristics and drivers that influence the needs and interests of various student markets, as well as current strategies being employed domestically and internationally to recruit and retain international students. International students have become a major factor in education markets that include specialized preparatory schools to major research universities. Many schools have relied on international students, who generally pay full tuition, to meet tuition revenue targets. As the world economy continues to globalize, and the importance of knowledge-driven industries expands, the importance of understanding and competing in global education markets continues to increase.

EDU 7262. Collaborations and Partnerships. 3 Hours.
Examines the many types of collaborations and partnerships available to institutions and explores the factors that influence success. As governments increasingly seek to internationalize their citizenry and students seek out international opportunities, international and global collaborations are becoming more commonplace. However, these collaborations can vary greatly, as can the results. Other topics include international negotiation, institutional compatibility, financial models, curriculum design, calendar variations, accreditation issues, and harmonization.
EDU 7263. International Education Law. 3 Hours.
Examines issues of intellectual property, homeland security, industry protectionism, academic freedom, student rights, and general reporting requirements as they relate to institutions operating domestically or globally. Operating across borders, whether offering programs or simply recruiting students, can introduce a complex layer of legal issues. Other topics include employer obligations, licensing requirements, and risk management.

EDU 7264. Educating Global Students: Issues and Practices. 3 Hours.
Examines higher education issues of quality, assessment, outcomes, faculty development, use of adjunct faculty, etc., which are intensified in transnational delivery. Transnational higher education (i.e., international education), typically defined as the mobility of higher education students and programs across countries, is not only a growing educative approach broadening world views and increasing access but is also seen as entrance to new student markets. The growth of transnational higher education brings opportunities and presents challenges.

EDU 7265. Contemporary Issues in Community Colleges. 3 Hours.
Examines contemporary issues facing community college administration, including promoting equity, open access, diversity and affirmative action, transfer policies, workforce development, and developmental education.

EDU 7267. Community College and Learning Communities. 3 Hours.
Examines the challenges of creating learning-centered community colleges. Focuses on creating a climate for learning, designing for inquiry, virtual collaboration and reflective dialogue, and faculty development.

EDU 7268. Community College Leadership. 3 Hours.
Examines the process that makes effective leaders in community colleges. Focuses on collaborative leadership, shared governance, working with internal campus committees, and working with external communities.

EDU 7269. Leadership in Higher Education: The College Presidency. 3 Hours.
Focuses on the special characteristics of the presidency in four-year colleges and universities. Structured around the three basic roles of the president—leader, manager, policymaker—uses case studies to illustrate the challenges of each. Considers views of the presidency by scholars and practitioner-observers and includes the experience of the presidency as described in the memoirs of former presidents. The premise of the course is that the presidency is a uniquely complex position, indispensable to the effective functioning of colleges and universities and subject to many different approaches depending on institutional needs and individual characteristics. Stresses the idea of the scholar-practitioner as a central element of effectiveness in each of the three critical roles.

EDU 7270. Leadership and Communication: Challenges and Interdependencies. 3 Hours.
Reviews the literature on organizational communication and examines contemporary cases relating to leadership and communication. Organizational success depends on effective internal and external communication. In large part, leaders influence communication behavior in organizations and can affect the credibility of formal communication networks, communication behavior during crises, organizational culture, the extent to which honesty is characteristic of employee interaction, and even the prevalence of the organizational grapevine. While leaders can affect organizational communication, communication proficiency can also affect the perceptions of leadership quality. Deficiencies in communication, regardless of administrative wisdom, can render the most brilliant individual an ineffective leader. Requires students to analyze their own organizations in terms of leadership and communication and to develop a communication plan for effective leadership.

EDU 7271. Information and Communication: Social and Conventional Networks. 3 Hours.
Examines the relationship between new technology and conventional networks for effective internal and external organizational communication for today’s leaders. Developing such relationships, which have been changed by new and evolving technology, is a leadership responsibility. Social networks are no longer informal but have become part of the prescribed network system of organizations. Understanding the nuances of social media in the twenty-first century is as or more significant than comprehending the chain of command or bureaucracy theories. Requires students to examine their own organizations in terms of the intelligent use of communication technology for information management and to develop a plan for improving communication in their organizations by incorporating social networks with conventional networks for the purposes of efficient information management.

EDU 7272. Global Perspectives of Organizational Culture. 3 Hours.
Examines organizational culture from an interdisciplinary and global perspective. The capability to understand and to interact with different organizational cultures across the world and the skill to build effective local organizational cultures are prerequisites to effective leadership. Examines key models of organizational culture and current research studies with an emphasis on how culture develops and evolves and its relationship to organizational performance. Offers students an opportunity to critique research designs and methodologies used to measure, describe, and understand organizational culture. Students with a deep understanding of organizational culture become empowered to organize systems, symbols, and people in ways that influence planning, policies, and resource allocations in their organizations.

EDU 7273. Professional Leadership and Communication. 3 Hours.
Focuses on both the analysis of organizational communication and the application and practice of communication strategies for leaders at all levels of the organization. Examines organizational communication—the message, what needs to be communicated and why, and how it should be communicated. Considers the messenger who informs and the organizational meaning-maker who articulates values and vision. Offers students an opportunity to practice and show proficiency in several communication areas: leading and participating in meetings, speaking/giving presentations to large and small audiences, responding to questions in press conference conditions, reducing interpersonal conflict and dealing with difficult personalities, creating collaborative engagement, and facilitating negotiation sessions. Reviews principles and techniques in each area. Uses simulated exercises and coaching to improve skill sets.

EDU 7274. Doctoral Seminar in Organizational Leadership and Communication. 3 Hours.
Examines critical and timely issues challenging education leaders. Uses individual consultations with the instructor and critical feedback from their peers to offer students an opportunity to focus their thesis arguments and articulate how their projects contribute to applied research in the field of organizational leadership and communication. May be repeated up to four times.

EDU 7275. Contemporary Models of Leadership. 3 Hours.
Approaches leadership as a function in social systems, reviewing contemporary perspectives of organizational leadership such as leadership and identity, complexity, shared, and global leadership. Understanding the theory and research underpinning current leadership practice is invaluable knowledge for any organizational leader. Offers students an opportunity to expand, apply, reflect on, and refine their personal leadership knowledge, skills, and abilities to further how they steward their organizations.
EDU 7276. Organizational Communication: Institutional and Global Perspectives. 3 Hours.
Examines the messages, meanings, patterns, and networks of communication, discourse, and symbols as they aid in defining the nature of educational organizations. The study of organizational communication is frequently referred to as the "dynamic interplay between communication processes and human organizing." Considers selected theoretical approaches and thematic strands in the study of organizational communication: function—the use of communication to accomplish tasks within educational settings; identity and relationship—how the organizations in which we participate affect us; technology—the centrality of social media to organizational networks, both internal and external; and globalization—the opportunities, practices, and responsibilities associated with the global organization.

EDU 7277. Organizational Learning and Systems Thinking. 3 Hours.
Offers students an opportunity to compare, contrast, and critique both seminal and modern theories and models of organizational learning and apply them to their own organizational settings. In today's fast-paced, complex, and interdependent environment, learning must occur constantly in organizations so that knowledge can be created, codified, disseminated, and refined. Leaders must be skilled at creating organizations that sense environmental signals of change to adapt accordingly. This course embraces a systems view of learning at the organizational level of analysis. Course assignments seek to enhance student ability to think systemically and to develop a comprehensive understanding of the core competencies required to create and build cultures of learning in organizations.

EDU 7278. Organization Theory and Design. 3 Hours.
Reviews the organizational design literature, both theory and research, in various settings and focuses on the interaction between the organization and its environment. As we move into a new century, the organizations we work in take on new shapes. The ability to anticipate and create new organizational forms is the mark of a successful leader. Emphasizes organizational theory and the many internal and external factors that cause an organization to fit a particular architecture. Explores classical and modern theories and key organizational design models. Offers students an opportunity to design a forward-thinking organization, creating all components, including vision, mission, strategy, structure, and processes.

EDU 7280. Fundamentals of Research. 3 Hours.
Offers students an overview of all components of a doctoral thesis. Designed to support students' efforts to hone in on their specific area of research and to write a problem of practice, research questions, and literature review. Offers students feedback on their work from faculty and peers in the course in order to complete a rough draft of the first two chapters of their potential thesis proposal.

EDU 7281. Research Design. 3 Hours.
Focuses on turning a research question into a potential thesis. Emphasizes effective alignment of problem, purpose, question, theory, and method. Offers students an opportunity to examine various qualitative and quantitative research designs and to explore the role of theory in each design. Encourages students to seek to gain a clear understanding of methodology and the different approaches and theories scholars have used to investigate their area of interest. Seeks to guide students through the process of creating a detailed outline that articulates all design components of their theses.

EDU 7282. Quantitative Research. 3 Hours.
Introduces students to a variety of quantitative research designs and the necessary procedures of each design in order for them to conceptualize their doctoral thesis research. Offers students an opportunity to acquire and practice skills in analyzing quantitative data. Students should conclude the course with a conceptual foundation for their doctoral thesis and familiarity with the proposal development process.

EDU 7283. Qualitative Research. 3 Hours.
Introduces students to a variety of methodological approaches in order for them to conceptualize their doctoral thesis research from the perspective of multiple qualitative perspectives. Students conduct a field project with the goal of gaining skills in collecting and analyzing data. Students should conclude the course series with a conceptual foundation for their doctoral thesis and familiarity with the proposal development process.

EDU 7284. Research Regional Seminar: Educational Research Ethics. 3 Hours.
Introduces ideas, legalities, and complex issues that are central to the ethics of educational research, with special emphasis on issues relevant to the Southeast region. Explores unethical research behavior that is obvious and also covers research misconduct involving principles and practices that are less easy to recognize and defend. Learning to become a responsible and successful researcher can be complicated and intellectually challenging. Being a participatory researcher within one’s specific region adds another layer of complexity to the researcher’s role and responsibility. This course is based on case studies in which there are complex and sophisticated research paradigms. Assesses and explores with a critical lens each case study to reach a higher level of nuanced understanding of the ethics in research.

EDU 7285. Research Regional Seminar: Educational Research in Regional Perspective. 3 Hours.
Designed with a focus on the collective audit of regional needs, enabling the faculty and graduate students to be involved in a broad range of community-oriented research issues in the Southeast region. Focuses on the complex economic, social, political, and educational characteristics of this region, using it as a laboratory that pedagogically links teaching, research, and service. The course is positioned around the theoretical and applied analysis of the Southeast metropolitan areas and their broader regional, national, and global contexts.

EDU 7286. Research Regional Seminar: Educational Research in a Postmodern World. 3 Hours.
Examines a problem of practice; the literature review associated with it; and the practice of collecting data, within the context of the Southeast region, as scholar-practitioners in a postmodern society. Explores the understandings in the Southeast region around assumptions and beliefs in education; notions of rationality, modernism, and postmodernism; the validation of value judgments; relations with future generations; multiculturalism and gender justice in democratic societies; and their impact on the review of, formulation of, and conduct of research design.

EDU 7287. Faith-Based Education in Democratic Society. 3 Hours.
Addresses the changes in the relationships between faith-based communities and democratic society as they are played out in public and private educational contexts. Emphasizes political, sociological, and historical analyses and their implications for contemporary educational leadership. Investigates controversies on forms of public funding for religious education, separation of church and state, Supreme Court decisions, and the relationship between religious communities and public policy.
EDU 7288. Faith, Ethics, and Leadership in Education. 3 Hours.
Examines the nexus between educational leaders’ multiple sources of
fidility in decision making. Focuses on the interplay between norms of
specific faith-based communities and traditions on the one hand and
ethical principles that cut across differences on the other. Focuses on
philosophies of education and their relationships to faith-based
educational aspirations. Through ethical inquiry and case studies of
religious communities, offers students an opportunity to articulate their
own approaches to ethical decision making in faith-based organizations
and in pluralist, diverse societal contexts.

EDU 7289. Global Perspectives for Faith-Based Leadership. 3 Hours.
Examines the place of religion, appropriations of religious traditions, and
media representations of religious motives in contemporary international
conflicts. Analyzes how these appropriations and representations might
call for responses that provide deeper understandings of these conflicts
and that offer frameworks for education. Religion and global conflict have
taken on new (as well as long-standing) associations in recent decades
that trouble and challenge educational leaders in public and private, secular
and faith-based contexts.

EDU 7290. Contemporary Models of Sports Leadership. 3 Hours.
Reviews contemporary leadership theory and models as applied to
the world of sports. Approaches leadership as a function of social
systems, emphasizing recent conceptualizations such as distributed
leadership, complexity leadership, and global leadership. Offers students
an opportunity to expand, apply, reflect on, and refine their personal
leadership knowledge, skills, and abilities to further how they steward
their sports organizations.

EDU 7291. Personnel Development in Sports Leadership. 3 Hours.
Provides an overview of general personnel development theories,
techniques, and tools that are applied to the context of sport. Contrasts
development in higher education, nonprofit, and private-sector sport
organizations that have athlete and nonathlete members that need to
work separately or in concert, including those that play a supportive role
to sporting activities. Includes learning and organizing theory. Covers the
basics of recruitment, training needs assessment, leading the training
function for performance improvement, orienting new employees, helping
personnel achieve professional and career goals, managing in-person and
virtual teams, making the buy-or-build decisions, promoting diversity and
inclusion, and how to use organizational strategies to ensure success of
personnel development initiatives to support the mission of sport
organizations.

EDU 7292. Social Justice in Sports. 3 Hours.
Examines issues related to social justice in sports, including the influence
of gender, economics, and geography within sports organizations.
Studies the global footprint of sport and applies sports leadership
principles to discover how sport can have a positive impact on society
and various cultures. These include developing personal leadership skills
and assumptions that can offer solutions for change. Sport organizations
have become more socially responsible within the communities that they
serve to help train and educate future leaders through the power of sport.
Offers students an opportunity to investigate examples of sport being
used as a vehicle for social justice and change worldwide. Studies the
use of sport for development and peace.

EDU 7293. Legal and Ethical Issues in Sports Leadership. 3 Hours.
Investigates numerous legal cases and issues present in sports both
professionally and at the amateur level. Seeks to enable students to
gain an understanding of the legal responsibilities of sports leaders.
Emphasizes researching ethical business and legal cases, including
social issues relating to race and ethnicity as well as other issues on
gender equity. In the amateur realm, investigates athletic eligibility, drug
testing, low student-athlete graduation rates, pay-for-play, concussion
protocol, and violence in sports. Sports leaders also need to understand
antitrust laws in order to protect and keep their respective sport
organizations within the letter of the law. Offers students an opportunity
to gain an understanding of how to apply legal theories to address each
of these scenarios.

EDU 7300. Doctoral Research Seminar. 1-3 Hours.
Offers a special topics course designed to support candidates in the
development of their doctoral projects. Through individual consultations
with the instructor and critical feedback from their peers, this course
offers students an opportunity to advance their Doctoral Project Proposal
(DPP) by focusing in-depth on a specific application of practice-based
research such as case studies, action research, evaluation studies, or
survey studies. May be repeated for up to 6 total credits.

EDU 7961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be
repeated without limit.

EDU 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions.

EDU 7976. Directed Study. 1-4 Hours.
Offers students an opportunity to carry out an individual reading and
research project under the supervision of a faculty member. The directed
study format allows for the in-depth analysis of a particular topic not
covered in-depth or the study of a subject not typically covered in the
curriculum. A directed study proposal must be approved by the faculty
sponsor, division head, and senior associate dean for academic affairs.

EDU 7978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the
department on a chosen topic.

EDU 7980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge,
and experiences into a capstone project.

EDU 7983. Topics. 1-4 Hours.
Covers special topics in education. May be repeated without limit.

EDU 7990. Thesis. 1-4 Hours.
Offers students the opportunity for theoretical and experimental work
conducted under the supervision of a departmental faculty.

EDU 7994. Thesis Continuation—PT. 0 Hours.
Offers continuing thesis supervision by members of the department.

EDU 7995. Project. 1-4 Hours.
Offers students an opportunity to undertake theoretical or experimental
work under individual faculty supervision. May be repeated without limit.

EDU 7996. Thesis Continuation. 0 Hours.
Offers students the opportunity for continued thesis work conducted
under the supervision of a departmental faculty.

EDU 8790. Doctoral Thesis Seminar. 6 Hours.
Supports the doctoral theses that must conform to the guidelines
developed by members of the faculty. Final theses must be presented to
a review panel prior to graduation. May be repeated once.
EDU 8791. Doctoral Thesis Continuation. 0 Hours.
Offers students an opportunity for continued doctoral thesis work conducted under the supervision of departmental faculty. May be repeated up to three times.

EDU 8792. Doctoral Thesis Continuation. 0 Hours.
Offers students an opportunity for continued doctoral thesis work conducted under the supervision of departmental faculty. May be repeated up to 24 times.

EDU 8796. Thesis Proposal and the Internal Review Board. 0 Hours.
Designed to support the thesis proposal and Internal Review Board (IRB) submission. After submitting their thesis proposals to the IRB, students are expected to continue to edit the first two chapters of their proposals in order to update or expand the literature review with recent contributions that have been made to the different bodies of research that inform their studies. Expects students to have developed a draft of the doctoral thesis proposal, including introductory chapter, literature review, and research design.

EDU 8797. Thesis Data Collection, Initial Analysis, and Management. 0 Hours.
Offers students an opportunity, following approval of the thesis proposal by the Internal Review Board, to begin their research projects, following their clear plans for data collection and early analysis. Expects students to gather data, conduct their initial analyses, and prepare their data for analysis.

EDU 8798. Thesis Data Analysis and Presentation. 0 Hours.
Offers students an opportunity to engage in the data analysis process and construct their presentation strategy for their analyses. Culminates with a completed outline of the fourth thesis chapter approved by the student’s thesis advisor and second reader.

EDU 8799. Thesis Findings and Discussion. 12 Hours.
Supports the processes associated with writing the results and discussion chapters of the thesis. Highlights the scholar-practitioner aspect of the program’s mission, requiring that students think carefully about the practical implications of their work and how they plan to communicate or disseminate those implications to an authentic audience and engage relevant stakeholders in a relevant application of their findings. Successful completion is determined by a student’s defense of the final thesis work that is approved by their thesis committee.

Electrical and Computer Engineering (EECE)

EECE 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EECE 2000. Introduction to Engineering Co-op Education. 1 Hour.
Provides students preparation for the first co-op experience. Focuses on skills that provide a basis for successful co-op engagement including expectations and requirements, an introduction to professional credentials, résumé construction, self-assessment and goal setting, interviewing, professional and co-op ethics, issues of diversity in the workplace community, academic planning and decision making, and an introduction to career portfolios.

EECE 2150. Circuits and Signals: Biomedical Applications. 5 Hours.
Offers an integrated lecture/lab course that covers circuit theory, signal processing, circuit building, and MATLAB programming. Introduces basic device and signal models and circuit laws used in the study of linear circuits. Analyzes resistive and complex impedance networks. Uses the ideal operational amplifier model, focusing on differential amplifiers and active filter circuits. Introduces basic concepts of linearity and time-invariance for both continuous and discrete-time systems and concepts associated with analog/digital conversion. Demonstrates discrete-time linear filter design on acquired signals in the MATLAB environment. Offers students an opportunity to explore circuits and signals in the lab and to use their knowledge of circuits, analog signals, digital signals, and biological signals to build a working analog/digital EKG system.

EECE 2160. Embedded Design: Enabling Robotics. 4 Hours.
Offers an integrated lecture/lab course that covers the basics of the Unix operating system, high-level programming concepts, introductory digital design, wireless networking, and Simulink design. Offers students a hands-on experience developing a remote-controlled robotic arm using an embedded systems platform.

EECE 2210. Electrical Engineering. 4 Hours.
Introduces the basic concepts related to circuits and circuit elements; current, voltage, and power; models for resistors, capacitors, and inductors; and circuit analysis using Kirchhoff’s laws. Discusses selected topics that illustrate a variety of applications of electrical engineering, such as AC circuits and electric power, the basics of semiconductor devices with applications to transistor amplifier models, transients in circuits with energy storage, mechanical controls and mechatronics, digital signals, logic circuits, and some basic concepts of computer operations, specifically, number coding, arithmetic operations, and memory circuits. Requires concurrent registration in EECE 2211.

EECE 2211. Lab for EECE 2210. 1 Hour.
Accompanies EECE 2210. Covers fundamental DC and AC electrical concepts as well as analog and digital electronics. Requires concurrent registration in EECE 2210.

EECE 2300. Computational Methods for Data Analytics. 4 Hours.
Introduces the programming tools, algorithms, and software tools used in data analytics. Offers hands-on experience working with statistical software/packages and scripting languages and shows students the power of computational tools. Covers concepts of correlation, regression analysis, classification, and decomposition. Includes example data-oriented applications taken from multiple science/engineering disciplines and applies linear algebra and probability to analyze actual data sets. Students not meeting course prerequisites may seek permission of instructor.

Covers the design and evaluation of control and data structures for digital systems. Uses hardware description languages to describe and design both behavioral and register-transfer-level architectures and control units. Topics covered include number systems, data representation, a review of combinational and sequential digital logic, finite state machines, arithmetic-logic unit (ALU) design, basic computer architecture, the concepts of memory and memory addressing, digital interfacing, timing, and synchronization. Assignments include designing and simulating digital hardware models using Verilog as well as some assembly language to expose the interface between hardware and software. Requires concurrent registration in EECE 2323.
EECE 2323. Lab for EECE 2322. 1 Hour.
Offers students an opportunity to design and implement a simple computer system on field-programmable logic using a hardware description language. Covers simulation and testing of designs. Requires concurrent registration in EECE 2322.

EECE 2412. Fundamentals of Electronics. 4 Hours.
Reviews basic circuit analysis techniques. Briefly introduces operation of the principal semiconductor devices: diodes, field-effect transistors, and bipolar junction transistors. Covers diode circuits in detail; the coverage of transistor circuits focuses mainly on large-signal analysis, DC biasing of amplifiers, and switching behavior. Uses PSpice software to simulate circuits and large-signal models and transient simulations to characterize the behavior of transistors in amplifiers and switching circuits. Digital electronics topics include CMOS logic gates, dynamic power dissipation, gate delay, and fan-out. Amplifier circuits are introduced with the evaluation of voltage transfer characteristics and the fundamentals of small-signal analysis. Requires concurrent registration in EECE 2413.

EECE 2413. Lab for EECE 2412. 1 Hour.
Covers experiments reinforcing basic electronics topics such as diodes, bipolar junction transistors (BJT) as a switch, BJT amplifiers, and MOSFET circuits for switching and amplification. Practical measurements include use of voltmeters, ammeters, ohm meters, and impedance meters, as well as oscilloscope measurements of frequency, gain, distortion, and upper- and lower-cutoff frequencies of amplifiers. Requires concurrent registration in EECE 2412.

EECE 2520. Fundamentals of Linear Systems. 4 Hours.
Develops the basic theory of continuous and discrete systems, emphasizing linear time-invariant systems. Discusses the representation of signals and systems in both the time and frequency domain. Topics include linearity, time invariance, causality, stability, convolution, system interconnection, and sinusoidal response. Develops the Fourier and Laplace transforms for the discussion of frequency-domain applications. Analyzes sampling and quantization of continuous waveforms (A/D and D/A conversion), leading to the discussion of discrete-time FIR and IIR systems, recursive analysis, and realization. The Z-transform and the discrete-time Fourier transform are developed and applied to the analysis of discrete-time signals and systems.

EECE 2530. Fundamentals of Electromagnetics. 4 Hours.
Introduces electromagnetics and high-frequency applications. Topics include transmission lines: transmission line model with distributed circuit elements, transmission line equations and solutions, one-dimensional traveling and standing waves, and applications; electromagnetic field theory: Lorentz force equations, Maxwell’s equations, Poynting theorem, and application to the transmission line’s TEM waves. Also studies uniform plane wave propagation along a coordinate axis and along an arbitrary direction; equivalent transmission lines for TEM, TE, and TM waves; reflection and refraction of uniform plane waves by conducting and dielectric surfaces. Discusses applications to wave guides, resonators, optical fibers, and radiation and elementary antennas. Introduces modern techniques (computational methods) and applications (optics, bioelectromagnetics, and electromagnetic effects in high-speed digital circuits). Requires concurrent registration in EECE 2531.

EECE 2531. Lab for EECE 2530. 1 Hour.
Accompanies EECE 2530. Supports class material related to transmission lines, wave-guiding structures, plane wave reflection and refraction, and antenna radiation. Includes experiments with microwave transmission line measurements and the determination of the properties of dielectric materials, network analyzer analysis of microwave properties of circuit elements and transmission line electrical length, analysis of effective dielectric constant and loss from microstrip line resonator transmission, optical measurement of refraction and reflection leading to determination of Brewster angle and optical constants for transparent and absorbing materials, and measurement of radiation patterns from dipole antennas. Requires concurrent registration in EECE 2350.

EECE 2540. Fundamentals of Networks. 4 Hours.
Presents an overview of modern communication networks. The concept of a layered network architecture is used as a framework for understanding the principal functions and services required to achieve reliable end-to-end communications. Topics include service interfaces and peer-to-peer protocols, a comparison of the OSI (open system interconnection) reference model to the TCP/IP (Internet) and IEEE LAN (local area network) architectures, network-layer and transport-layer issues, and important emerging technologies such as Bluetooth and ZigBee.

EECE 2560. Fundamentals of Engineering Algorithms. 4 Hours.
Covers the design and implementation of algorithms to solve engineering problems using a high-level programming language. Reviews elementary data structures, such as arrays, stacks, queues, and lists, and introduces more advanced structures, such as trees and graphs and the use of recursion. Covers both the algorithms to manipulate these data structures as well as their use in problem solving. Introduces algorithm complexity analysis and its application to developing efficient algorithms. Emphasizes the importance of software engineering principles.

EECE 2750. Enabling Engineering. 4 Hours.
Offers students an opportunity to develop a proposal for a design project that uses engineering technologies to improve the lives of individuals with cognitive or physical disabilities. Offers student project groups an opportunity to work with end users and caregivers at local nursing homes and special education schools to assess a specific need, research potential solutions, and develop a detailed proposal for a project. Project groups are matched with product design mentors who guide groups through the design process. Lectures cover relevant topics, including surveys of specific physical and cognitive disabilities and applicable engineering technologies. The same project may not be used to satisfy both this course and EECE 4790. May be repeated up to two times.

EECE 2794. Introductory Directed Research in Electrical and Computer Engineering. 4 Hours.
Offers first- and second-year students an opportunity to pursue project and other independent inquiry opportunities under faculty supervision. The course is initiated with a student-developed proposal, including expected learning outcomes and research products, which is approved by a faculty member in the department. Requires permission of instructor.

EECE 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
EECE 3000. Professional Issues in Engineering. 1 Hour.
Provides students with an opportunity to reflect on both academic and co-op experiences in the context of planning for the senior year and beyond. Issues include professional and ethical issues, resolving ethical conflicts, awareness of engineers as professionals in a diverse world, strengthening decision-making skills, career portfolios, and lifelong learning needs, goals, and strategies. Students reflect upon issues of diversity from their experience in the University and in their cooperative education placements. Explores the role of different work and learning styles and diverse personal characteristics on the workplace and the classroom. Professional issues include impact of the cultural context, both in the United States and around the world, on the client, government relations, and the workplace.

EECE 3154. Hyperspectral Imaging in an International Context. 4 Hours.
Covers hyperspectral imaging, including instrumentation, data acquisition, and signal processing, taught in an international context. Specific topics include concepts of optics in optical measurement systems (lens equation, diffraction, spectroscopy, radiometry), effects of optical properties of atmosphere and target on images, and selection of appropriate wavelengths for different applications. Offers students an opportunity to learn about Beer’s law, reflection, scattering, and other basic concepts to apply to computational techniques. Introduces different analytical techniques to solve inverse problems. Taught in an international context with a partner faculty member with complementary expertise in the field to gain an understanding of different equipment and analytical approaches for a global perspective on this discipline.

EECE 3230. Computer Architecture for Computer Scientists. 4 Hours.
Introduces the organization and architecture of computer systems. Uses the MIPS assembly language introduced in the prerequisite course, CS 2600, to illustrate the instruction set architecture. Introduces the basics of digital and logic circuits, followed by a description of the structure and function of the data path and control hardware. Illustrates the implementation of the instruction set by single-cycle, multiple-cycle, and a basic pipeline. Covers the architecture of modern high-performance processors inclusive of performance evaluation, arithmetic, hardware and software organization trade offs, and memory management (caching and virtual memory).

EECE 3324. Computer Architecture and Organization. 4 Hours.
Presents a range of topics that include assembly language programming, number systems, data representations, ALU design, arithmetic, the instruction set architecture, and the hardware/software interface. Offers students an opportunity to program using assembly language and to simulate execution. Covers the architecture of modern processors, including datapath/control design, caching, memory management, pipelining, and superscalar. Discusses metrics and benchmarking techniques used for evaluating performance.

EECE 3392. Electronic Materials. 4 Hours.
Provides a basic treatment of electronic materials from atomic, molecular, and application viewpoints. Topics include atomic structure and bonding in materials, structure of materials, and crystal defects. These topics lay a foundation for the introduction of thermal and electronic conduction, which is the underlying physics of electronic devices. Finally, the electronic properties of semiconductors, dielectric, magnetic, superconducting, and optical materials are examined. The latter half deals with an introduction to the state of the art in electronic materials, including semiconductor nanoelectronics, magnetic semiconductors and spintronics, molecular electronics, carbon nanotubes, conducting polymers, diamondlike carbon, and other topics representing recent technological breakthroughs in the area of electronic materials.

EECE 3410. Electronics 2. 4 Hours.
Covers transistors and op-amp circuits. Emphasizes real devices and their performance, analog IC design concepts, and building blocks. Reviews the Laplace transform and introduces its applications to analysis of electronic circuits governed by linear differential equations. Presents and employs equivalent models of passive and active elements in s-domain analysis including response speed, pole/zero plots, and magnitude/phase frequency behavior of important network functions. Introduces feedback and stability, oscillators, A/D and D/A converters and mixed-signal circuits, active filters, sensors and signal-conditioning circuits, and other design topics at the discretion of the instructor. Uses SPICE simulation to support design work. Includes laboratory hardware projects.

EECE 3468. Noise and Stochastic Processes. 4 Hours.
Discusses probability, random variables, random processes, and their application to noise in electrical systems. Begins with the basic theory of discrete and continuous probabilities, then develops the concepts of random variables, random vectors, random sequences, and random processes. Continues with a discussion on the physical origins of noise and models of where it is encountered in electronic devices, signal processing, and communications. Defines the concepts of correlation, covariance, and power density spectra and uses them to analyze linear system operations in continuous time.

EECE 3990. Elective. 1–4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EECE 4512. Biomedical Electronics. 4 Hours.
Provides the fundamental background required to interface biological systems with circuits and sensors. Includes signal conditioning electronics, electrodes, and other sensors used to extract information from the organism and safety considerations for medical applications. Combines lectures and labs.

EECE 4520. Software Engineering 1. 4 Hours.
Provides an overview of main concepts in software engineering, the software process, methods, techniques, and tools. Topics include requirements analysis and specification; software design, coding, testing, and maintenance; and verification, validation, and documentation. Covers structured analysis and object-oriented design methodologies. Presents overviews of user interface design, prototyping, CASE tools, software metrics, and software development environments. Includes a small software development project.

EECE 4524. VLSI Design. 4 Hours.
Covers a structured digital CMOS design focusing on designing, verifying, and fabricating CMOS VLSI-integrated circuits and modules. Emphasizes several topics essential to the practice of VLSI design as a system design discipline including systematic design methodology, good understanding of CMOS transistor, physical implementation of combinational and sequential logic network, and physical routing and placement issues. Begins design exercises and tutorials with basic inverters and proceeds to the design, verification, and performance of large, complex digital logic networks. Also covers IC design methodologies and performance, scaling of MOS circuits, design and layout of subsystems such as PLA and memory, and system timing. Requires lab session that includes computer exercises using CAD tools to design VLSI layouts and switch-level plus circuit-level simulations to design and analyze the project.

EECE 4525. Lab for EECE 4524. 1 Hour.
Accompanies EECE 4524. Covers topics from the course through various experiments.
EECE 4528. CAD for Design and Test. 4 Hours.
Addresses the principles of the algorithms and approaches for VLSI design and test automation. Briefly covers basic data structures and graph algorithms typically used for computer-aided design (CAD) as well as general-purpose methods for combinatorial optimization, such as backtracking, branch-and-bound, simulated annealing, and genetic algorithms. Design automation topics include physical design automation (partitioning, floor planning, placement, global and detailed routing, cell generation, and layout compaction), and high-level synthesis (scheduling, resource allocation). Testing topics include an overview of fault modeling, automatic test pattern generation, design for testability, and built-in self test (BIST). Course involves some programming assignments (implementation of some of the algorithms covered in class) as well as using state-of-the-art CAD tools in the design flow.

EECE 4530. Hardware Description Languages and Synthesis. 4 Hours.
Focuses on modeling of digital systems in a hardware description language. Topics include textual vs. graphical modeling of digital systems, syntax and semantics of the VHDL language, modeling for simulation, and modeling for synthesis. Students use a commercially available CAD tool to simulate and synthesize digital system descriptions.

EECE 4532. Embedded System Design. 4 Hours.
Concentrates on design methodology, design of components, utilization of packages, use of design tools, and programming of embedded systems. Begins with presentation of register-transfer level design and ends with an implementation of a microcontroller as part of an embedded system. Teaches the Verilog Hardware Description Language and its related tools and uses them as a means of describing hardware at various levels of abstraction for simulation and synthesis. Also uses Field Programmable Gate Arrays and related design tools for simulation and synthesis.

EECE 4534. Microprocessor-Based Design. 4 Hours.
Focuses on the hardware and software design for devices that interface with embedded processors. Topics include assembly language; addressing modes; embedded processor organization; bus design; electrical characteristics and buffering; address decoding; asynchronous and synchronous bus protocols; troubleshooting embedded systems; I/O port design and interfacing; parallel and serial ports; communication protocols and synchronization to external devices; hardware and software handshake for serial communication protocols; timers; and exception processing and interrupt handlers such as interrupt generation, interfacing, and auto vectoring.

EECE 4535. Lab for EECE 4534. 1 Hour.
Accompanies EECE 4534. Consists of a comprehensive laboratory performed by a team of students. These laboratory exercises require students to design, construct, and debug hardware and software that runs on an embedded platform. Exercises are centered around a common embedded platform. The final exercise is a project that lets each group integrate hardware and software to realize a complete embedded design.

EECE 4542. Advanced Engineering Algorithms. 4 Hours.
Covers classical and modern algorithms that efficiently solve hard electrical and computer engineering optimization problems. These problems arise in a wide range of disciplines—including computer-aided design, parallel computing, computer architecture, and compiler design—and are usually NP-complete, making it unlikely that optimal solutions can be found in a reasonable amount of time. Covers the fundamentals of algorithm analysis and complexity theory and then surveys a wide range of combinatorial optimization techniques, including exhaustive algorithms, greedy algorithms, integer and linear programming, branch and bound, simulated annealing, and genetic algorithms. Considers the efficient generation of optimal solutions, the development and evaluation of heuristics, and the computation of tight upper and lower bounds.

EECE 4572. Communications Systems. 4 Hours.
Introduces basic concepts of digital communication over additive white Gaussian noise (AWGN) channels. Reviews frequency domain signal analysis through treatment of noiseless analog communication. Reviews foundations of stochastic processes including stationarity, ergodicity, autocorrelation, power spectrum, and filtering. Provides an introduction to lossless and lossy source coding and introduces Huffman and Lempel-Ziv algorithms. Introduces optimal quantization and PCM and DPCM systems. Examines geometric representation of signals and signal space concepts, principles of optimum receiver design for AWGN channels, correlation and matched filter receivers, and probability of error analysis for binary and M-ary signaling through AWGN channels, and performance of ASK, PSK, FSK, and QAM signaling schemes. If time permits, also covers digital PAM transmission through band-limited AWGN channels, zero ISI condition, system design in the presence of channel distortion, and equalization techniques.

EECE 4574. Wireless Communication Circuits. 4 Hours.
Covers the electronics of radio receivers and transmitters. Employs a commercial radio transceiver (NorCal 40A) as a learning tool. Presents basic topics (radio spectrum utilization, antennae, and information processing by modulation and demodulation). Studies building block realizations for modulators and demodulators for analog (AM, FM) and digital (ASK, PSK, FSK) radio. Covers common radio receiver architectures. Presents circuit-level designs of radio building blocks (resonators; L-C RF filters; crystals and IF filters; tuned transformers and impedance matching; amplifiers and power amplifiers; RF oscillators; mixers and up/down frequency conversion; signal detectors; and automatic gain control circuits). Includes receiver noise and sensitivity; transmitter range; spurious emissions and IM distortion; antennae and propagation in the atmosphere; wireless standards; multiple-access techniques; and software-defined radio, if time permits.

EECE 4604. Integrated Circuit Devices. 4 Hours.
Offers a comprehensive introduction to the technology, theory, and applications of the most important electronic devices in today’s integrated circuits. Topics include semiconductor electronic properties, Si fabrication technologies, p-n junctions, MOS capacitors, MOSFETs, metal-semiconductor contacts, and bipolar transistors. Emphasizes MOS devices, which are currently the dominant technology in integrated circuits. Introduces recent research trends in novel device concepts. Offers students who may pursue semiconductor process engineering, IC design, biomedical electronics, or research and development of microelectromechanical systems (MEMS) or optoelectronics devices an opportunity to obtain electronic device knowledge.
EECE 4622. Parallel and Distributed Processing. 4 Hours.
Covers parallel and distributed processing concepts including concurrency and its management, models of parallel computation, and synchronous and asynchronous parallelism. Topics include simple parallel algorithm formulation, parallelization techniques, interconnection networks, arrays, trees, hypercubes, message routing mechanisms, shared address space and message-passing multiprocessor systems, communication cost and latency-hiding techniques, scalability of parallel systems, and parallel programming concepts and application case studies.

EECE 4626. Image Processing and Pattern Recognition. 4 Hours.
Provides an introduction to processing and analysis of digital images with the goal of recognition of simple pictorial patterns. Topics include discrete signals and systems in 2-D, digital images and their properties, image digitization, image enhancement, image restoration, image segmentation, feature extraction, object recognition, and pattern classification principles (Bayes rules, class boundaries) and pattern recognition methods.

EECE 4630. Robotics. 4 Hours.
Introduces robotics analysis covering basic theory of kinematics, dynamics, and control of robots. Develops students' design capabilities of microprocessor-based control systems with input from sensory devices and output actuators by having teams of students design and implement a small mobile robot system to complete a specific task, culminating in a competition at the end of the course. Covers actuators, sensors, system modeling, analysis, and motion control of robots.

EECE 4638. Special Topics in Computer Engineering. 4 Hours.
Focuses on advanced topics related to computer engineering technology to be selected by instructor. May be repeated without limit.

EECE 4642. Antennas. 4 Hours.
Introduces the fundamental physical principles for the electromagnetic radiation from antennas and presents the most important mathematical techniques for the analysis of the radiation. Applies these principles and techniques to practical antenna systems. Starts with the fundamental parameters of the antennas. Introduces the vector potentials and the theorems that are needed for the derivation of the radiation integrals from Maxwell's equations. Covers the application of these theories to practical antennas and antenna systems, including linear wire antennas, loop antennas, linear and two-dimensional planar phased arrays, patch antennas, frequency-independent antennas, and aperture and reflector antennas. Presents impedance matching techniques.

EECE 4644. Microwave Circuits and Networks. 4 Hours.
Addresses novel applications of analytical and engineering techniques for RF/microwave circuits and networks. Presents fundamental concepts, essential mathematical formulas and theorems, and engineering applications. Emphasizes transmission lines and smith charts, microstrip lines, S-parameters and network theory, impedance matching and tuning, and novel RF devices such as resonators, power dividers, and filters. Introduces active networks. Provides ample examples to ensure that the participants fully appreciate the power of the materials described in the class.

EECE 4646. Optics for Engineers. 4 Hours.
Presents the basic optical concepts necessary for an understanding of current and future optical communication, remote sensing, and industrial and biomedical systems. Topics include geometrical optics, polarized light, diffraction, and interference. Studies lasers and other light sources, optical fibers, detectors, CCD cameras, modulators, and other components of optical systems. Presents applications to specific systems such as fiber-optic communication, medical imaging systems, fiber-optic sensors, and laser radar.

EECE 4648. Biomedical Optics in an International Context. 4 Hours.
Covers biomedical optics and discusses the theory and practice of biological and medical applications of lasers. Topics covered include fundamentals of light propagation in biological tissues and light-matter interactions such as elastic and inelastic scattering; computational modeling techniques; fluorescence and phosphorescence; diagnostic imaging techniques such as confocal fluorescence microscopy, diffuse optical tomography, and optical coherence tomography; novel imaging techniques such as phase conjugation and ultrasound modulated optical tomography; and therapeutic interventional techniques, including photodynamic therapy, laser thermal therapies, and fluorescence-guided surgeries. Taught abroad in collaboration with a world expert on computational modeling. May be repeated without limit.

EECE 4649. Biomedical Imaging. 4 Hours.
Explores a wide variety of modalities for biomedical imaging in the pathology laboratory and in vivo. After an introductory discussion of tissue properties, waves used in imaging, and contrast mechanisms, the course discusses modalities such as microscopy, endoscopy, x-ray, computed tomography, ultrasound, and MRI. With each modality, instrument parameters, contrast mechanisms, resolution, and depth of penetration are considered. Offers students an opportunity to work in groups to complete a project in which they examine one modality in detail and either generate synthetic data using a computational model or process available image data.

EECE 4660. Introduction to Microelectromechanical Systems. 4 Hours.
Introduces the design and manufacture of microelectromechanical systems (MEMS), including principles of MEMS sensing and actuation, microfabrication, and packaging. Covers electrical, thermal, and mechanical behavior of microsystems, the design of electromechanical and thermal sensors and actuators, MEMS microfabrication, and MEMS packaging techniques. Studies a variety of microscale sensors and actuators (e.g., electrical switches, pressure sensors, inertial sensors, and optical MEMS). Devotes the last third of the course largely to design projects, involving design of MEMS devices to specifications in a realistic fabrication process. Students who do not meet course restrictions may seek permission of instructor. EECE 4660 and ME 4660 are cross-listed.

EECE 4692. Subsurface Sensing and Imaging. 4 Hours.
Introduces the emerging field of subsurface sensing and imaging (SSI). Topics include the interrelatedness of the three technological levels of sensing, modeling and signal processing, and computational technology, the similarity of SSI across diverse problem domains and size scales, and the variety of information extraction strategies such as localized imaging and the use of multiple views in space, wavelength, and so on. Provides hands-on experience with a particular SSI modality that includes experimental measurement and subsequent processing and visualization of the measured data.

EECE 4694. Numerical Methods and Computer Applications. 4 Hours.
Presents numerical techniques used in solving scientific and engineering problems with the aid of digital computers. Topics include theory of interpolation; the theory of numerical integration and differentiation, numerical solutions of linear as well as nonlinear systems of equations, the theory of least squares; and numerical solution of ordinary and partial differential equations using a programming environment such as MATLAB.

EECE 4698. Special Topics in Electrical Engineering. 4 Hours.
Covers various topics from term to term, depending on the interests of the department and the students. May be repeated without limit.
EECE 4790. Electrical and Computer Engineering Capstone 1. 4 Hours. Requires students to select a project requiring design and implementation of an electrical, electronic, and/or software system, form a team to carry out the project, and submit and present a detailed proposal for the work. Students must specify the materials needed for their project, provide cost analysis, and make arrangements with their capstone adviser to purchase and/or secure donation of equipment. Requires student to perform a feasibility study by extensive simulation or prototype design of subsystems to facilitate the second phase of the capstone design.

EECE 4792. Electrical and Computer Engineering Capstone 2. 4 Hours. Continues EECE 4790. Requires students to design and implement the project proposed in that earlier course. Expects students to evaluate progress with interim milestone reports and to present the final design project with written and oral reports.

EECE 4949. Research Laboratory Project. 4 Hours. Offers an opportunity to conduct research in a laboratory setting under faculty supervision. May be repeated once.

EECE 4970. Junior/Senior Honors Project 1. 4 Hours. Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

EECE 4971. Junior/Senior Honors Project 2. 4 Hours. Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

EECE 4990. Elective. 1-4 Hours. Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EECE 4991. Research. 4 Hours. Offers an opportunity to conduct research under faculty supervision.

EECE 4992. Directed Study. 1-4 Hours. Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

EECE 4993. Independent Study. 1-4 Hours. Offers theoretical or experimental work under individual faculty supervision. May be repeated without limit.

EECE 4994. Internship. 4 Hours. Offers students an opportunity for internship work. May be repeated without limit.

EECE 4996. Experiential Education Directed Study. 4 Hours. Draws upon the student’s approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using the course to fulfill their experiential education requirement. May be repeated without limit.

EECE 5155. Wireless Sensor Networks and the Internet of Things. 4 Hours. Covers design and modeling of architectures, communication protocols, and algorithms for wireless sensor networks. The first part of the course covers general aspects of wireless sensor networking, including protocol design, modeling, and simulation at all layers of the communication stack. The second part covers standardization efforts, including Bluetooth, IEEE 802.15.4 and Zigbee, RFID, 6LowPan, and Internet of Things, among others. The third part covers applications of sensor networks technology to many challenging problems of our times, including cyber-physical systems, smart cities, smart transportation systems, and underwater sensory systems.

EECE 5161. Thin Film Technologies. 4 Hours. Covers the fundamentals of vacuum technology, thin film deposition technologies, characterization technologies, their applications in different industries, and the frontiers of research activities on thin film deposition technologies. Thin films are fundamental building blocks for integrated circuits chips, microelectromechanical systems (MEMS) devices, and nanoelectromechanical system devices (NEMS), etc., and play critical roles in determining the performance of IC circuits, MEMS, and NEMS devices. Topics include vacuum technologies; vacuum pumps; vacuum system design and analysis; different thin film deposition technologies, including sputtering, chemical vapor deposition, electrochemical deposition, atomic layer deposition, etc.; and different thin film characterization technologies, in particular the magnetic thin film characterization technologies, including VSM, PPMS, FMR, MOKE, etc. Students who do not meet course prerequisites may seek permission of instructor.

EECE 5170. Introduction to Multiferroics Materials and Systems. 4 Hours. Offered by the NSF Nanosystems Engineering Research Center for Translational Applications of Nanoscale Multiferroic Systems (TANMS), which is co-taught by professors from University of California, Los Angeles; University of California, Berkeley; Cornell University; California State University, Northridge; and Northeastern University. Course lectures are available online for remote students. Topics include introduction to multiferroics; atomic structure of multiferroics (chemistry); multiferroic material science; continuum-level analysis of multiferroic materials; and multiferroic devices.

EECE 5576. Wireless Communication Systems. 4 Hours. Examines fundamental principles of wireless system design, focusing on modern techniques used in cellular systems and wireless local area networks. Covers various levels of system design, from modulation/detection to traffic analysis. Introduces basics of radio propagation and studies their effect on communication signals. Special topics include spatial frequency reuse; cell blocking and cellular system capacity; power control and hand-off strategies; channel access and sharing; orthogonal frequency division multiplexing (OFDM—a modulation technique used in WLAN and the fourth-generation [4G] cellular systems) and spread spectrum modulation (third-generation WCDMA systems); diversity techniques and multi-input multi-output (MIMO) signal processing. Requires an undergraduate course in communications systems.

EECE 5580. Classical Control Systems. 4 Hours. Introduces the analysis and design of classical control systems. Examines control system objectives, modeling and mathematical description, transfer function and state-variable representations, feedback control system characteristics, system responses, and stability of feedback systems. Also addresses compensator design based on root-locus and frequency response, and modern control system design using state-variable feedback.

EECE 5581. Lab for EECE 5580. 1 Hour. Accompanies EECE 5580. Covers the practical aspects of control systems design through lab experiments. Topics vary and include computer simulation, digital computer control, and use of CAD packages such as MATLAB for analysis and design of control systems. Examples emphasize concepts introduced in EECE 5580, such as system response to stimuli, stability, and robustness.
EECE 5606. Micro- and Nanofabrication. 4 Hours.
Provides an overview of integrated circuit fabrication from the viewpoint of a process engineer. Offers students an opportunity to fabricate micro- and nanoscale devices in integrated lab sessions. Focuses on the physics, chemistry, and technology of integrated circuit fabrication in the lecture portion of the course, while students fabricate and test novel devices (an electrohydrodynamic micropump and three-dimensional carbon nanotube interconnects) in integrated lab sessions. Concentrates on silicon IC technology but also includes examples from other materials and device systems including microelectromechanical (MEMS) technologies that are used to build devices such as accelerometers, pressure sensors, and switches for telecommunications and other current examples provided from nanofabrication and nanotechnology. Lab hours are arranged.

EECE 5610. Digital Control Systems. 4 Hours.
Covers sampling and analysis tools for linear discrete-time dynamic systems, including the design of digital control systems using transform techniques by discrete equivalent and direct design methods; root locus, Bode and Nyquist diagrams, and Nichols charts; controller implementation issues, such as digital filter realizations, nonlinear effects due to quantization, round off, dead band, and limit cycles; and selection of the sampling rate.

EECE 5626. Image Processing and Pattern Recognition. 4 Hours.
Introduces processing and analysis of digital images with the goal of recognition of simple pictorial patterns. Topics include discrete signals and systems in 2D, digital images and their properties, image digitization, image enhancement, image restoration, image segmentation, feature extraction, object recognition, and pattern classification principles (Bayes rules, class boundaries) and pattern recognition methods.

EECE 5627. Arithmetic and Circuit Design for Inexact Computing with Nanoscaled CMOS. 4 Hours.
Studies the principles of inexact (approximate) computing through arithmetic and circuit design. By reducing circuit complexity, critical path delay, and power dissipation at the expense of introducing processing errors in computation, inexact computing is one of the leading emerging paradigms in nanoscale computing. Topics include basic computer arithmetic, approximation criteria, error analysis, nanoscale CMOS principles (PTMs), case studies, and experimental assessment.

EECE 5639. Computer Vision. 4 Hours.
Introduces topics such as image formation, segmentation, feature extraction, matching, shape recovery, dynamic scene analysis, and object recognition. Computer vision brings together imaging devices, computers, and sophisticated algorithms to solve problems in industrial inspection, autonomous navigation, human-computer interfaces, medicine, image retrieval from databases, realistic computer graphics rendering, document analysis, and remote sensing. The goal of computer vision is to make useful decisions about real physical objects and scenes based on sensed images. Computer vision is an exciting but disorganized field that builds on very diverse disciplines such as image processing, statistics, pattern recognition, control theory, system identification, physics, geometry, computer graphics, and learning theory. Requires good programming experience in Matlab or C++.

EECE 5640. High-Performance Computing. 4 Hours.
Covers accelerating scientific and other applications on computer clusters, many-core processors, and graphical processing units (GPUs). Modern computers take advantage of multiple threads and multiple cores to accelerate scientific and engineering applications. Topics covered include parallel computer architecture, parallel programming models, and theories of computation, as well as models for many-core processing. Highlights implementation of computer arithmetic and how it varies on different computer architectures. Includes an individual project where each student is expected to implement an application, port that application to several different styles of parallelism, and compare the results. Programming is done in variants of the C programming language.

EECE 5642. Data Visualization. 4 Hours.
Introduces relevant topics and concepts in visualization, including computer graphics, visual data representation, physical and human vision models, numerical representation of knowledge and concept, animation techniques, pattern analysis, and computational methods. Topics include tools and techniques for practical visualization and elements of related fields, including computer graphics, human perception, computer vision, imaging science, multimedia, human-computer interaction, computational science, and information theory. Covers examples from a variety of scientific, medical, interactive multimedia, and artistic applications. Includes hands-on exercises and projects. Emphasizes modern engineering applications of computer vision, graphics, and pattern classification methodologies for data visualization.

EECE 5643. Simulation and Performance Evaluation. 4 Hours.
Studies simulation and performance evaluation in computer systems. Primarily covers both classic and timely techniques in the area of performance evaluation, including capacity planning to predict system performance, scheduling, and resource allocation in computer systems. Introduces basic computational and mathematical techniques for modeling, simulating, and analyzing the performance by using simulation, including models, random-number generation, statistics, and discrete event-driven simulation.

EECE 5644. Introduction to Machine Learning and Pattern Recognition. 4 Hours.
Studies machine learning, the study and design of algorithms that enable computers/machines to learn from experience/data. Covers a range of algorithms, focusing on the underlying models between each approach. Emphasizes the foundations to prepare students for research in machine learning. Topics include Bayes decision theory, maximum likelihood parameter estimation, model selection, mixture density estimation, support vector machines, neural networks, probabilistic graphics models, and ensemble methods (boosting and bagging). Offers students an opportunity to learn where and how to apply machine learning algorithms and why they work.

EECE 5647. Nanophotonics. 4 Hours.
Introduces basic concepts and recent developments in nanophotonic materials and devices. Nanophotonics is one very important research area in nanotechnology. Discusses the fundamentals of electromagnetics (Maxwell's equations, polarization, wave propagations, etc.); quantum mechanics; and typical nanofabrication and characterization techniques. Focuses on specific topics in nanophotonics, including silicon photonics; photonic crystals; plasmonics and optical metamaterials, with their diverse applications in optical circuits; imaging; optical trapping; biomedical sensing; and energy harvesting. Offers students an opportunity to obtain a fundamental understanding of the property and manipulation of light at the nanoscale.
EECE 5648. Biomedical Optics. 4 Hours.
Covers biomedical optics and discusses the theory and practice of biological and medical applications of lasers. Topics covered include fundamentals of light propagation in biological tissues, light-matter interactions such as elastic and inelastic scattering, fluorescence and phosphorescence; diagnostic imaging techniques such as confocal fluorescence microscopy, diffuse optical tomography, and optical coherence tomography; and therapeutic interventional techniques, including photodynamic therapy, laser thermal therapies, and fluorescence-guided surgeries.

EECE 5649. Design of Analog Integrated Circuits with Complementary Metal-Oxide-Semiconductor Technology. 4 Hours.
Covers theoretical analysis, practical design, and simulation of analog integrated circuits implemented in complementary metal-oxide-semiconductor (CMOS) fabrication process technologies. Introduces cadence tools for circuit simulations, physical layout, and layout verification. Begins with basic concepts such as CMOS device models, DC and small-signal analysis techniques for single- and multistage amplifiers, biasing configurations, and reference generation circuits. Explores differential signal processing, operational amplifiers, operational transconductance amplifiers, and common-mode feedback circuits. Analysis methods include the evaluation of linearity, noise, stability, and device mismatches from process variations. Addresses some advanced design techniques, such as linearity improvement methods, frequency compensation, and digitally assisted performance tuning.

EECE 5664. Biomedical Signal Processing. 4 Hours.
Introduces biomedical signal processing and biomedical imaging and image processing. Specific topics covered depend on instructor and/or student’s areas of interest and are drawn from a variety of application areas. They include the nature and processing of intrinsic signals such as cardiac and neurological bioelectric signals, natural processing of external signals such as auditory and visual processing, and topics related to a variety of medical and biological imaging modalities.

EECE 5666. Digital Signal Processing. 4 Hours.
Presents the theory and practice of modern signal processing techniques. Topics include the characteristics of discrete signals and systems, sampling, and A/D conversion, the Z-transform, the Fourier transform, and the discrete Fourier transform; fast Fourier transform algorithms; design techniques for IIR and FIR digital filters; multirate digital filters; and quantization effects in digital signal processing. Graduate students may register for this course only if they did not complete an undergraduate course in digital signal processing; such graduate registration requires approval of instructor and an internal departmental petition.

EECE 5667. Lab for EECE 5666. 1 Hour.
Accompanies EECE 5666. Focuses on practical aspects of DSP by programming a digital signal processing chip in a high-level language using an integrated development and debugging environment. Topics include input/output operations via A/D and D/A converters, digital frequency synthesis, computation of discrete-time convolution, and design and implementation of both FIR and IIR filters.

EECE 5680. Electric Drives. 4 Hours.
Examines all subsystems that comprise an electric drive including electric machines, power electronic converters, mechanical system requirements, feedback controller design, and interactions with utility systems. Based on an integrative approach that requires minimal prerequisites: a junior-level course in signals and systems and some knowledge of electromagnetic field theory (possibly from physics classes), and does not require separate courses in electric machines, controls, or power electronics.

EECE 5681. Lab for EECE 5680. 0 Hours.
Accompanies EECE 5680. Covers topics from the course through various experiments.

EECE 5682. Power Systems Analysis 1. 4 Hours.
Examines common types of power system faults. Starts with a detailed description of three-phase modeling of basic power system elements such as transmission lines, transformers, and generators. Then presents fundamentals of three-phase circuit analysis in the steady state, both for balanced and unbalanced operating conditions. Uses symmetrical component transformation and positive, negative, and zero sequence networks to analyze unbalanced systems. Presents methods to calculate fault currents and postfault bus voltages. Reviews basic protective relaying and relay settings using typical distribution system examples.
EECE 5694. Electromagnetic Photonic Devices. 4 Hours.
Introduces basic principles of photonic devices. Topics include crystal optics, dielectric optical waveguides, waveguide couplers, electro-optic devices, magneto-optic devices, acousto-optic devices, nonlinear effects, and optical switching. Discusses both theory and concept. This is a multidisciplinary course, and novel emerging areas in nanoscale optics and metamaterials are described.

EECE 5695. Radio-Frequency and Optical Antennas. 4 Hours.
Introduces the fundamental physical principles for electromagnetic radiation from antennas. Presents the most important mathematical techniques for radiation analysis. Applies these principles and techniques to practical antenna systems. Starts with the fundamental parameters of the antennas. Introduces the vector potentials and the theorems that are needed for the derivation of the radiation integrals from Maxwell’s equations. Covers the application of these theories to practical antennas in radio frequency and optical communication systems and in new emerging areas. Some examples are wire antennas, loop antennas, linear and two-dimensional planer phased arrays, patch antennas, frequency-independent antennas, and aperture and reflector antennas. Also discusses metamaterial nanoscale optical antennas.

EECE 5696. Energy Harvesting Systems. 4 Hours.
Covers different aspects of energy harvesting systems, such as energy harvesting devices, power conditioning, energy storage, etc. Explores different energy harvesting technologies, including solar energy, wind energy, vibration energy, thermoelectric energy, etc. Examines different kinds of functional materials used for different energy harvesting technologies, including piezoelectric materials, magnetic materials, solar cell materials, thermoelectric materials, etc. Emphasizes vibration energy harvesting technologies and functional materials for vibration energy harvesting.

EECE 5697. Acoustics and Sensing. 4 Hours.
Introduces the fundamental concepts of acoustics and sensing with waves. Offers a unified theoretical approach to the physics of image formation through scattering and wave propagation in sensing. Topics include the linear and nonlinear acoustic wave equation; sources of sound; reflection, refraction, transmission, and absorption; bearing and range estimation by sensor array processing, beam forming, matched filtering, and focusing; diffraction, bandwidth, ambient noise, and reverberation limitations; scattering from objects, surfaces, and volumes by Green’s theorem; forward scatter, shadows, Babinet’s principle, extinction, and attenuation; ray tracing and waveguides in remote sensing; and applications to acoustic, radar, seismic, thermal, and optical sensing and exploration.

EECE 5698. Special Topics in Electrical and Computer Engineering. 4 Hours.
Covers special topics in electrical and computer engineering. Topics are selected by the instructor and vary from semester to semester. May be repeated up to four times.

EECE 6000. Introduction to Cooperative Education. 1 Hour.
Designed to introduce graduate engineering students to the cooperative education program and focuses on skills that provide a basis for successful co-op engagement. Affords students the opportunity to develop job-search, job-survival, and career-management skills. Seeks to help students understand the co-op program, policies, and expectations; understand how to use the Northeastern Web site to access online information used in the job-search process; identify and describe their skills and work values and how they relate to their career choices; learn how to write and critique a resume; learn and practice proper interviewing skills and techniques; and communicate their interests, skills, needs, and future plans to their co-op coordinator and future employers.

EECE 6960. Exam Preparation—Master’s. 0 Hours.
Offers the student the opportunity to prepare for the master’s qualifying exam under faculty supervision.

EECE 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EECE 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

EECE 6965. Co-op Work Experience Abroad. 0 Hours.
Provides eligible students with an opportunity for work experience abroad. May be repeated without limit.

EECE 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

EECE 7105. Optics for Engineers. 4 Hours.
Provides an introductory graduate course in optics, presenting the engineering concepts necessary to understand and evaluate electro-optical systems. Begins with a brief but rigorous treatment of geometric optics, including matrix methods, aberrations, and pupils and windows, with practical examples of optical instruments and electro-optical systems. Topics include polarization, interference, diffraction, and optical properties of crystals, thin films, optical resonators, guided waves, modulators, and detectors. Presents concepts with examples from modern optical systems such as LIDAR, fiber-optical sensors, range finders, infrared systems, and optical communication systems. Requires a Bachelor of science in engineering or physics.

EECE 7200. Linear Systems Analysis. 4 Hours.
Covers fundamental algebraic concepts and algebraic structures. Topics include linear operators and their representations; matrices, algebraic equations, equivalence, and similarity transformations; introduction to the state-variable theory of continuous and discrete linear systems; standard canonical representations, the concept of state, and the representation of interconnected systems, linear spaces, the state equations, and their solution; stability; and introduction to the general control problem in terms of controllability and observability.

EECE 7201. Solid State Devices. 4 Hours.
Covers the fundamental elements of solid-state device physics and the application of these principles. Seeks to provide students with the opportunity to develop an understanding of pn junctions, bipolar junction transistors, and MOSFETs.

EECE 7202. Electromagnetic Theory 1. 4 Hours.
Examines the fundamental equations, their physical meaning, principal mathematical techniques, and important engineering applications. Topics include sources of the electromagnetic field, Lorentz force equation, integral form of Maxwell’s equations and point relations (differential equations and boundary conditions), electromagnetic energy and power, propagation of uniform and nonuniform plane waves in homogeneous media, reflection and refraction, scalar and vector potentials, solutions in the absence of boundaries for static and dynamic problems, solutions to boundary value problems, duality, uniqueness, images, physical theory of diffraction, and general theory of metal and dielectric wave-guides and resonators for Cartesian and cylindrical systems.
EECE 7203. Complex Variable Theory and Differential Equations. 4 Hours. 

EECE 7204. Applied Probability and Stochastic Processes. 4 Hours. 
Covers fundamentals of probability and stochastic processes with applications to estimation and queueing theory. Includes basic laws of probability, conditioning, and Bayes rule. Topics include random variables and their functions; PDF, PMF, and CDF notions; statistical averages; moments and characteristic functions; multiple random variables; joint and conditional PDF and PMF; multiple functions of random variables; correlation and covariance; mean squared estimation of random variables; Markov, Chebychev, and Chernov inequalities; various notions of convergence of random variable sequences; laws of large numbers; central limit theorem; and large deviation theory. As time permits, discusses basic notions of estimation and properties of estimators, unbiased and minimum variance estimation, CRLB, sufficient statistics, consistency of estimators, basic notions of discrete and continuous-time random processes, mean and autocorrelation function, WSS and cyclo-stationary processes, ergodicity of random processes, and other topics. Requires a strong understanding of linear systems, transform techniques, and linear algebra.

EECE 7205. Fundamentals of Computer Engineering. 4 Hours. 
Introduces fundamental techniques in computer engineering used throughout the graduate curriculum. Covers basic programming and analysis methods and the formulation and solution of a wide range of computer engineering problems. Also discusses the applications of algorithm analysis and complexity theory to analyzing and solving problems. Emphasizes those fundamental computational problems and related algorithms whose solution can be obtained in polynomial time. For basic computational problems such as sorting, searching, elementary graph algorithms, shortest-paths problems, as well as flow problems in networks, many different algorithms and data structures are described and analyzed, implemented, and compared both from a theoretical and from an experimental point of view.

EECE 7211. Nonlinear Control. 4 Hours. 
Discusses phase plane analysis for nonlinear systems. Topics include fundamentals of Lyapunov theory; absolute stability, passivity, averaging, singular perturbation, input-output stability, and other advanced stability topics; describing functions; nonlinear control methods based on linearization, feedback linearization, sliding control, Lyapunov, and passivity and center manifold theory and bifurcations.

EECE 7212. Multivariable Control Systems. 4 Hours. 
Discusses mathematical preliminaries, polynomial, and polynomial matrices; representations of linear multivariable system; matrix fraction description (MFD) and polynomial matrix description (PMD); responses of linear multivariable systems; controllability, observability, and canonical forms; poles and zeros of multivariable systems; stability; realization problem; interaction control; state feedback and observer design; compensator design, stability, and robustness; noninteraction control; and frequency domain design techniques.

EECE 7213. System Identification and Adaptive Control. 4 Hours. 
Discusses fundamental issues of adaptive identification and control, such as stability of adaptive systems, convergence, persistent excitation, and robustness. Identification is the process of mathematically modeling a system based on measurement data that may be limited or uncertain. Adaptive control, then, is the means by which a system that is poorly modeled is controlled adequately. Enhances the underlying basic ideas that are essential for adaptive control. Emphasizes recursive approaches, such as recursive least squares algorithm, where parameter estimates are updated in real time. Covers simple adaptive systems, adaptive observers, and adaptive control. Discusses in detail two major adaptive schemes, model reference adaptive control (MRAC) and self-tuning regulators (STR).

EECE 7214. Optimal and Robust Control. 4 Hours. 
Explores state-space, time-domain techniques for analyzing and designing optimal and robust linear control systems. Introduces basic concepts of dynamic optimization and applies them to problems of short-term and long-term optimal control, path planning and stabilization, state estimation, and filtering. Emphasizes linear quadratic optimization, H2 control, H-infinity control, and mu-synthesis. Reviews pertinent linear systems concepts and discusses connections with a geometric intuition relating quadratic optimization to projections.

EECE 7220. Power System Analysis 2. 4 Hours. 
Continues EECE 5682. Reviews power flow studies, power system protection, power system controls, transient operation of transmission lines, transient stability, and HVDC transmission.

EECE 7221. Power System Operation and Control. 4 Hours. 
Provides tools and techniques needed to analyze and quantify phenomena that arise in operation and control of modern power systems. Considers problems that have a wide-ranging importance in power systems and includes analysis of steady-state and control of power systems dynamics. These problem areas share a common mathematical framework. The first part of the course covers a classical study of steady states in power systems and the solution of voltage stability problems associated with them. The goal is to present problems (and solutions) of load flow with several modifications, namely, frequency deviations and voltage-sensitive loads. The second part covers modeling, analysis, and controller design for electromechanical transients in power systems (load variations, frequency, and power transmission dynamics). Connections are established with modern robust control theory. Requires a knowledge of controls.

EECE 7224. Power Systems State Estimation. 4 Hours. 
Offers an up-to-date account of the strategies utilized in state estimation of electric power systems. Provides a broad overview of power system operation and the role of state estimation in overall energy management. Presents an abundance of examples, models, tables, and guidelines to clearly examine new aspects of state estimation, the testing of network observability, and methods to assure computational efficiency.

EECE 7226. Modeling and Simulation of Power System Transients. 4 Hours. 
Presents computer modeling of linear and nonlinear power system components to be used in transient studies. Covers methods of digital simulation of power systems operating in the steady-state and transient conditions. Discusses use of transient simulation programs for design and analysis of power systems. Students are asked to carry out a term project and deliver a presentation about its outcome.
EECE 7228. Advanced Power Electronics. 4 Hours.
Designed to familiarize students with advanced power electronic circuits. Covers single-phase and three-phase rectifiers and inverters, including their principles of the operation, design, analysis, and applications. Diode rectifiers, phase-controlled rectifiers, and switch mode rectifiers and inverters are among the topics. Introduces different modulation techniques. If time permits, covers three-phase ac-ac converters and soft switching techniques, as well.

EECE 7236. Special Topics in Control. 4 Hours.
Covers aspects of controls not studied in other courses. Topics may vary from year to year. May be repeated without limit.

EECE 7237. Special Topics in Power Electronics. 4 Hours.
Covers aspects of power electronics not studied in other courses. Topics may vary from year to year. May be repeated without limit.

EECE 7238. Special Topics in Electric Drives. 4 Hours.
Covers aspects of electric drives not studied in other courses. Topics may vary from year to year. May be repeated without limit.

EECE 7239. Special Topics in Power Systems. 4 Hours.
Covers aspects of power systems not studied in other courses. Topics may vary from year to year. May be repeated without limit.

EECE 7240. Analog Integrated Circuit Design. 4 Hours.
Treats the analysis and design of analog ICs, their functional performance, and applications. Focuses on the various building blocks of analog circuits, their operation, and the underlying principles and techniques, with analysis supplemented by CAD simulation. Topics include modeling and layout of CMOS, bipolar, BiCMOS devices, and passive components; DC building blocks, including precision current and voltage references; performance analysis of signal gain, impedances, and frequency response and speed of basic/compound amplifier structures; architectures of operational amplifiers, including low-voltage, OTAs, and three-stage designs; feedback and performance merits, topologies, instability, and frequency compensation of feedback amplifiers; nonlinear and analog computation IC functions; noise in ICs, physical origins and device modeling, noise circuit analysis, SNR and NF, and techniques for the enhancement of system noise performance.

EECE 7241. Advanced Solid State Devices. 4 Hours.
Covers state-of-the-art topics in solid-state devices including advanced MOSFET concepts like deep-submicron scaling, HBTs, HEMTs, MESFETs, and other high-frequency/high-speed semiconductor devices.

EECE 7242. Integrated Circuits for Mixed Signals and Data Communication. 4 Hours.
Covers analysis and design of ICs for high-speed communications and mixed-signal processing. Focuses on performance of CMOS and BiCMOS implementations of building blocks for these systems. Covers passive R, L, C, and active devices for ICs; broadband amplifiers, TIAs, limiters, buffers/drivers, muxes, and demuxes; circuit noise modeling and analysis and methods for optimization of SNR and BER, with applications to optical communication; baseband and HF filters; design methods of L-C, OTA-C, MOSFET-C, and switched-C filters; data conversion and D/A and A/D characteristics, popular DAC architectures, serial and parallel ADCs, and high-resolution techniques; clock generators and oscillators, L-C resonator-based designs, VCOs, PLLs and frequency synthesis, and CDR circuits. Requires a verification review of a selected publication relevant to the course. Students who do not meet course prerequisites may seek permission of instructor.

EECE 7243. Integrated Circuit Fabrication. 4 Hours.
Discusses the fundamental aspects of integrated circuit fabrication beginning with the scientific foundations for diffusion, oxidation, ion implantation, chemical and physical vapor deposition, etching, and lithography. Then covers state-of-the-art integrated circuit fabrication technologies in a seminar format.

Introduces microelectromechanical systems, including principles of sensing and actuation, microfabrication technology for MEMS, noise concepts, and packaging techniques. Covers a wide range of disciplines, from electronics to mechanics, material properties, microfabrication technology, electromagnetics, and optics. Studies several classes of devices including inertial measurement devices, pressure sensors, rf components, and optical MEMS. Devotes the last third of the semester largely to projects involving design of MEMS devices to specifications in a realistic fabrication process.

EECE 7245. Microwave Circuit Design for Wireless Communication. 4 Hours.
Covers planar microwave circuits and integrated circuits (MMICs) for wireless communication systems. Employs microwave CAD tools in design projects as well as in-class case-study examples. Reviews communication system basics, modulation and demodulation, architectures of receivers and transmitters, and system performance. Covers planar transmission lines and coupled lines and their application to important devices and microwave circuit functions and multiport networks using S-parameters, flow graphs, and Smith charts. Studies microwave filters, narrowband and broadband amplifiers, their gain and stability, impedance matching, and noise performance, as well as mixers and frequency-conversion techniques. Finishes with design and performance of microwave oscillators. Covers wireless standards, multiple-access techniques, and recent advances if time permits.

EECE 7246. Design and Analysis of Digital Integrated Circuits. 4 Hours.
Explores the analysis and design of basic digital-integrated-circuit logic families. Focuses on CMOS and BiCMOS circuits and covers emitter-coupled logic (ECL). Covers design considerations including propagation delay, switching speed, fan-out, and the effect of parasitics. Discusses noise, cross talk, and interconnect issues as well as bistable circuits and clocks. Correlates design techniques with computer simulations.

EECE 7247. Radio Frequency Integrated Circuit Design. 4 Hours.
Introduces radio frequency (RF) integrated circuit analysis, design, and simulation methods with an emphasis on CMOS implementations. Covers basic RF design concepts including linearity, noise figure, sensitivity, impedance matching, and imperfections of integrated passive components (parasitics, quality factors). Discusses front-end circuit design considerations for low-noise amplifiers, mixers, oscillators, and power amplifiers.

EECE 7250. Power Management Integrated Circuits. 4 Hours.
Presents power management circuits with a focus on modern system on a chip (SoC). Introduces linear regulators, switching converters, switched-capacitor converters, voltage references, energy harvesters, and battery chargers. Studies various control methods, design trade-offs, and performance metrics in the context of an SoC. Introduces emerging energy-harvesting techniques for IC design. After completing this course, the successful student should be able to design, characterize, choose, or specify power-management circuits or ICs for a system.
EECE 7263. Humanoid Robotics. 4 Hours.
Investigates the emerging field of humanoid robotics. Topics may include humanoid designs, software and hardware architectures, sensing and perception, motion planning and control, high-level task planning and control, grasping and manipulation, benchmarking, and experimental methods. Course projects emphasize model-based control of humanoids for completing practical tasks from space exploration to disaster response.

EECE 7269. Special Topics in Electronics, Semiconductor Devices, and Microfabrication. 4 Hours.
Covers aspects of electronics, semiconductor devices, and microfabrication not studied in other courses. Topics may vary from year to year. May be repeated without limit.

EECE 7270. Electromagnetic Theory 2. 4 Hours.
Continues EECE 7202. Examines important electrodynamic applications by the use of advanced mathematical techniques. Topics include general theory of wave-guides and resonators with application to the cylindrical geometry; dielectric rod wave-guide; optical fibers; radiation; linear antennas; loop antenna; linear arrays; ray optics; scattering and diffraction of waves for planar, cylindrical, and spherical geometries; and effects of random media.

EECE 7271. Computational Methods in Electromagnetics. 4 Hours.
Provides emphasis on the system’s aspects of radar engineering. Topics include basic theory of radar detection, measurement of range, angle, and Doppler shift; classes of radar systems; types of radar noise; components of a radar system; matched filters and correlation receivers as applied to radar systems; and fundamental ideas of radar system analysis. Also explores search radar theory, maximum likelihood estimation approach to year. May be repeated without limit.

EECE 7274. Propagation in Artificial Structures. 4 Hours.
Covers effective dielectric and permeability constants in composite materials at high frequencies, electromagnetic wave propagation in electrical and magnetic anisotropic media, magneto-static and magnetoelastic wave propagation in single layer, and electromagnetic wave propagation in multilayers. Requires knowledge of electromagnetic field theory.

EECE 7275. Antennas and Radiation. 4 Hours.
Presents the fundamental theory and properties of antennas. Topics include equivalence, reciprocity, uniqueness, Huygen’s principle, antenna impedance, and diffraction; linear, loop, array, and aperture antennas including horns, reflectors, lenses, and microstrip; transmitting and receiving antennas and transmission formulas; and numerical antenna analysis methods.

EECE 7276. Microwave Properties of Materials. 4 Hours.
Discusses general dielectric and magnetic properties of materials, tensor properties of dielectric and magnetic materials, special microwave properties of thin-film materials, and experimental techniques developed in the characterization of microwave materials. Requires knowledge of electromagnetics and materials science.

EECE 7277. Microwave Electron Devices. 1-4 Hours.
Presents the fundamental principles and operation of the principal types of conventional (linear-beam and crossed-field) and novel (maser effect) devices. Topics include interactions of nonrelativistic and relativistic electron beams with electromagnetic fields, linear-beam tubes (klystron, traveling wave tube, backward-wave amplifier, and oscillator), crossedfield tubes (magnetron, forward-and-backward cross-field amplifier, and high-gain CFA), and maser-effect devices (cyclotron maser and gyrotron). May be repeated without limit.

EECE 7279. Fourier and Binary Optics. 4 Hours.
Examines the fundamentals of Fourier and binary optics from a theoretical and a practical viewpoint. Topics include radiation as a wave, polarization of radiation, reflection and refraction at surfaces, optical diffraction, scalar wave equation, Helmoltz and Kirchoff integral theorems, Fresnel and Fraunhoffer diffraction, Green’s theorem, interferometry, division of amplitude, division of wave front, diffraction gratings, multilayer filters, interferometric instrumentation, and holography. Also discusses imaging properties of lenses and optical systems, coherent and incoherent imaging, modulation transfer function, spatial filtering, diffraction-limited optical systems, surface design of binary optical elements, miniature and micro-optics, fabrication of diffraction-limited optics, and applications of diffraction-limited optics.

EECE 7280. Fourier Optics. 4 Hours.
Covers current topics of interest in Fourier optics and optical instrumentation. Discusses application of coherence phenomena to optical instrumentation including microdensitometers, microscopes, viewers, cameras, spectrophotometric, and interferometric instruments. Also considers applications of holography, optical data processing and computing, holographic memories, optical modulation, noise and its effects on data collection, synthetic aperture optics, and medical application of laser optics.

EECE 7282. Lasers. 4 Hours.
Introduces basic principles of lasers. Topics include models for the interaction of electromagnetic radiation and matter, laser threshold and rate equations, resonator theory, transverse and longitudinal modes, Rigrod analysis, homogeneous and inhomogeneous broadening, Q switching, cavity dumping, and mode locking. Discusses specific laser types including gas, liquid, and solid, and the applications of lasers and laser systems.
EECE 7284. Optical Properties of Matter. 4 Hours.
Presents the formal mathematical treatment of classical crystal optics including dispersion, polarization, birefringence, metal optics, and the optics of thin films. Emphasis is on the interaction of electromagnetic waves and the crystal lattice. Classical crystal optics are extended to nonlinear effects observed with very intense electric and magnetic fields. Presents applications of nonlinear optics, such as second- and third-harmonic generation, optical mixing, optical parametric oscillation, multiple photon interaction, and linear and nonlinear scattering. Various topics in linear and nonlinear optics are applied in such areas as birefringent filters, second-harmonic generators, optical parametric oscillators, and acousto-optical beam deflectors.

EECE 7285. Opto-electronics and Fiber Optics. 4 Hours.
Covers the fundamentals of the opto-electronic elements that interconnect to create a fiber-optic system for communication and sensing. Discusses the structure of single and multimode fibers, step and graded index fibers, modal theory of fiber propagation, ray theory of multimode fibers, fiber parameters, numerical aperture, Etendue, modal cutoff, couple mode theory, semiconductor physics, diode lasers and LED sources, photovoltaic and photoconductive detectors, coupling sources and detectors to optical fibers, noise in fiber-optic systems, active and passive components, modulators and couplers, fiber interferometry, and applications in communication and sensing.

EECE 7286. IR Imaging. 4 Hours.
Covers the basic concepts necessary for understanding, designing, and evaluating electro-optical systems including modern infrared technology. Emphasis is on considering the system as a whole including radiation sources, the optical collection system, and the detection process. Performance characteristics and system limitations are derived for a variety of imaging and nonimaging systems, as well as for laser devices. Systems to be analyzed may include standard commercial television, night vision devices, laser rangers, thermal imagers, satellite imagers (LANDSAT, SPOT), optical communications, and guidance systems.

EECE 7287. Optical Detection. 4 Hours.
Covers the detector as a component of an optical system. Topics include the laws governing radiation and radiometry, properties of real radiation sources, detailed descriptions of detection devices, noise, contrast, and MTF, imaging and ranging devices, and electro-optical detector systems analysis. Also includes practical consideration in real detectors, resolution and recognition of signals, heterodyne detection, sub-nanosecond pulse detection, and calibration of electro-optical detectors.

EECE 7288. Light and Information. 4 Hours.
Covers the fundamentals of classical and quantum optical signal processing and information theory. Topics include a review of basic wave theory for signal and information processing, classical wave entropy and information, number of degrees of freedom and information capacity of classical imaging systems, information-theoretic wave imaging algorithms, number of degrees of freedom and information capacity of general wave radiation, propagation and scattering systems, basic quantum physics for electrical and computer engineers, quantum bits (qubits), quantum circuits, quantum entanglement, the basics of quantum wave entropy and information, and the basics of quantum information theory. Applications covered include information-theoretic characterization of wireless and antenna systems, fundamental limits in sensors and vision, optical imaging, optical communications, and cryptography.

EECE 7289. Plasma Engineering. 4 Hours.
Overviews the basic principles and applications of plasma and gaseous discharges. Topics include gas kinetics, interaction of electrons and ions with static and rf fields, and wave propagation in plasmas. Discusses applications in material processing, space exploration, and microwave devices.

EECE 7290. Plasma Theory. 4 Hours.
Introduces the basic theory of gaseous discharges. Discusses fluid and kinetic description of collisionless and collisional plasmas with and without magnetic field effects. Emphasis is on linear stability analysis, although also discusses nonlinear effects.

EECE 7291. Plasma Processing Seminar. 4 Hours.
Covers the fundamental physics of plasmas in a lecture format. Students then investigate state-of-the-art plasma processing techniques used in integrated circuit fabrication, MEMS, and other materials processing applications in a seminar format.

EECE 7292. Modern Imaging. 4 Hours.
Covers basic and advanced topics in imaging engineering. Starts with the formulation of typical forward problems in electromagnetic and acoustic wave field propagation and scattering, emphasizing biomedical and nondestructive testing applications, and continues with a survey of imaging methodologies including the so-called qualitative imaging methods. Topics covered are: obstacle scattering, inhomogeneous medium scattering, uniqueness and stability in inverse scattering, imaging with finite data, point-source method and its applications, singular sources and shape reconstruction, linear sampling methods, signal-subspace-based methods, noniterative approaches for the inverse medium problem, intensity-only imaging, estimation theory in imaging and the question of superresolution, and selected topics in compressive sensing and quantum imaging.

EECE 7293. Applied Magnetism. 4 Hours.
Covers the fundamentals of magnetism and magnetic materials, their applications in different industries, and the frontiers of research activities on magnetism and magnetic materials. Includes magnetic units, magnetic classification, origin of ferromagnetism and ferrimagnetism, magnetic anisotropies, magnetostriction, magnetic domain theory, ferromagnetic/ferrimagnetic resonance, soft magnetic materials, hard magnetic materials, applications of magnetic materials, and information storage.

EECE 7294. Electronic Materials. 4 Hours.
Covers the fundamentals of electronic materials from atomic, molecular, and application viewpoints. Topics include atomic structure and bonding in materials, structure of materials, and crystal defects. These topics lay a foundation for thermal and electronic conduction, which is the underlying physics of electronic devices. Examines the electronic properties of semiconductors, dielectric, magnetic, superconducting, and optical materials. The latter half of the course deals with an introduction to state-of-the-art electronic materials, including semiconductor nanoelectronics, magnetic semiconductors and Spintronics, molecular electronics, carbon nanotubes, conducting polymers, graphene and graphane, and other topics representing recent technological breakthroughs in the area of electronic materials.
EECE 7297. Advanced Magnetic Materials—Magnetic Devices. 4 Hours.
Covers magnetism and magnetic materials, their applications in different industries, magnetic devices, and the frontiers of research activities on magnetism and magnetic materials. Topics include magnetics units, magnetic materials classification, origin of ferromagnetism and ferrimagnetism, magnetic anisotropies, magnetostriction, magnetic domain theory, ferromagnetic/ferrimagnetic resonance, soft magnetic materials, hard magnetic materials, applications of magnetic materials, information storage, and leading-edge research. Includes lectures on different magnetic sensors—including AMR, GMR, TMR, fluxgate, magnetostrictive sensors, etc.—and on microwave magnetic devices—including tunable filters, phase shifters, isolators, circulators, etc.

EECE 7298. Magnetic Materials—Fundamentals and Measurements. 4 Hours.
Covers the fundamentals of magnetism and magnetic materials, their applications in different industries, and the frontiers of research activities on magnetism and magnetic materials. Includes magnetic units, magnetic materials classification, origin of ferromagnetism and ferrimagnetism, magnetic anisotropies, magnetostriction, magnetic domain theory, and information storage. Also covers different magnetic material characterization methods, including B-H looper, VSM, MOKE, field-sweep FMR, frequency-sweep FMR, permeameters, etc.

EECE 7309. Special Topics in Electromagnetics, Plasma, and Optics. 4 Hours.
Covers aspects of electromagnetics, plasma, and optics not studied in other courses. Topics may vary from year to year. May be repeated without limit.

EECE 7310. Modern Signal Processing. 4 Hours.
Covers theory and practice of modern signal processing techniques with emphasis on optimal filtering and multirate signal processing. Includes the principle of orthogonality, Wiener and Kalman filters, linear prediction, spectral factorization, the Yule-Walker equations, decimation and interpolation, Noble identities and polyphase representation, and maximally decimated filter banks.

EECE 7311. Two Dimensional Signal and Image Processing. 4 Hours.
Examines the fundamentals of two-dimensional signal processing, with emphasis on image processing. Topics include signals, systems, and transforms in two dimensions; design and analysis of FIR and IIR filters; DFT and FFT algorithms; generation of digital image from the source; image digitizers and display devices; image transforms; techniques for point-wise, local, and global image enhancement; statistical image restoration techniques including recursive estimation; image coding techniques in spatial and transform domain including coding for facsimile transmission; and feature analysis. Requires a good understanding of linear systems, transform techniques, linear algebra, and random processes.

EECE 7312. Statistical and Adaptive Signal Processing. 4 Hours.
Uses linear mean square estimation concepts to explore some important areas of statistical and adaptive signal processing. Offers students an opportunity to gain a thorough understanding and working knowledge of FIR Wiener filtering, linear prediction, and autoregressive model matching; autocorrelation estimation and the deterministic least squares method; LMS and RLS adaptive filters; order recursive (triangular and lattice) architectures; and beamforming in antenna arrays. Emphasizes performance analysis of adaptive filters under nonstationary conditions; triangular covariance factorization; geometric derivation of RLS adaptive algorithms; a factual knowledge of some basic concepts concerning fundamentals of regularized least squares and the Kalman filter interpretation of the RLS algorithm; IIR (Laguerre-based) lattice configuration; and nonlinear adaptive filtering.

EECE 7313. Pattern Recognition. 4 Hours.

EECE 7314. Auditory Signal Processing. 4 Hours.
Offers particular relevance to engineers interested in the processing and production of audio signals including speech, music, and audible noise. Discusses how sounds are processed and perceived in the auditory system by exploring physiological and psychological acoustics. Emphasis is on mathematical models of the auditory system. Topics include properties of acoustical stimuli; anatomy and physiology of the auditory system; electrical recordings from the auditory system; acoustic emissions from the ear; nonlinear, positive feedback model of cochlear mechanics; methods of psychophysical measurements; absolute thresholds; temporal integration; masking and auditory frequency analysis; signal detection theory applied to the auditory system; experiments on and models of auditory discrimination; temporal processing in the auditory system including gap detection thresholds and models of temporal processing; loudness; Zwicker’s loudness summation model; pitch of simple and complex tones; and binaural hearing. Explores practical applications of psychoacoustics.

EECE 7315. Digital Image Processing. 4 Hours.
Focuses on generation of digital image from the source; image digitizers and display devices; image transforms; enhancement techniques, such as histogram, equalization, and edge sharpening; restoration by Wiener and Kalman filters; image coding using run-length coding; DPCM; transform coding; and feature analysis. Undergraduate course in digital signal processing highly recommended but not required.

EECE 7316. Modern Spectral Analysis and Array Processing. 4 Hours.
Describes the problem of estimating spectra from finite records of noisy data and reviews applications including communications (especially wireless), biomedicine, geophysics, speech, nondestructive testing, and sonar and radar. Explores common power spectrum estimation algorithms. Emphasizes the advantages and limitations of conventional, Capon’s, multiple window, maximum entropy, parametric (AR, MA, and ARMA), and harmonic decomposition (Prony, Pisarenko, and SVD) methods, in terms of accuracy (bias), reliability (variance), applicability, and other criteria. Introduces higher-order and nonstationary spectrum estimation including conventional and parametric higher-order methods and sliding window (short-time Fourier transform and model-based), adaptive, time-frequency, and wavelet techniques for the nonstationary problem. Examines extensions to multichannel and multidimensional data, discusses the array processing problem from a spectrum estimation perspective, and introduces the wave-field perspective. Discusses nonparametric and parametric array processing techniques and applications.
EECE 7317. Digital Filter Banks and Wavelets. 4 Hours.
Develops the theory and applications of perfect reconstruction digital filter banks (PR filter banks) and continuous-time wavelet and wave-packet representations. The mathematical structure of the two disciplines are shown to be intimately related and the theory of both is developed from a signal processing and an abstract mathematical viewpoint. Examines applications that include signal processing and digital communications. Emphasis is on the multiresolution analysis (MRA) of discrete and continuous-time signals and to applications that make use of this paradigm. Requires a strong understanding of digital signal processing, modern signal processing, and linear systems/vector spaces.

EECE 7323. Numerical Optimization Methods. 4 Hours.
Introduces fundamental theoretical and algorithmic concepts behind numerical optimization theory for objective functions with finite numbers of parameters. Optimization problems arise ubiquitously in all areas of engineering and science. Presents established numerical methods for iterative unconstrained and constrained optimization. Topics covered include line-search and trust-region strategies, gradient descent and Newton methods and their variations, linear and quadratic programming, penalty-augmented Lagrangian methods, sequential quadratic programming, and interior point methods. The course relies on the use of Matlab in projects. Requires a basic knowledge of calculus and linear algebra.

EECE 7327. Special Topics in Signal Processing 1. 4 Hours.
Covers aspects of signal processing not studied in other courses. Topics may vary from year to year. Topics may include physics-based image restoration methods for subsurface sensing problems, fundamentals of linear and nonlinear inverse problems, wave-field signal processing, and tomographic imaging. May be repeated without limit.

EECE 7328. Special Topics in Signal Processing 2. 4 Hours.
Covers aspects of signal processing not studied in other courses. Topics may vary from year to year. Topics may include physics-based image restoration methods for subsurface sensing problems, fundamentals of linear and nonlinear inverse problems, wave-field signal processing, and tomographic imaging. May be repeated without limit.

EECE 7329. Special Topics in Signal Processing 3. 4 Hours.
Covers aspects of signal processing not studied in other courses. Topics may vary from year to year. Topics may include physics-based image restoration methods for subsurface sensing problems, fundamentals of linear and nonlinear inverse problems, wave-field signal processing, and tomographic imaging. May be repeated without limit.

EECE 7330. Multi-User Detection. 4 Hours.
Focuses on the fundamentals of joint data detection for cochannel users. Applications include magnetic recording channels and 3G base station design. Topics include the multiaccess channel, long sequences, random sequences, carrier modulation, nonantipodal modulation, matched-filter outputs, single-user matched filter, optimal receiver for the single-user channel, probability of error for asynchronous users, asymptotic multiuser efficiency and related measures, coherent single-user matched filter in Rayleigh fading, optimum coherent multiuser detection, minimum error probability in the asynchronous channel, optimum asymptotic efficiency, near-far resistance, performance analysis in Rayleigh fading, optimum noncoherent multiuser detection, decorrelating detector, truncated-window decorrelating detector, coherent decorrelator in the presence of fading, differentially coherent decorrelation, decorrelation for nonlinear modulation, nondecorrelating linear multiuser detection, mmse linear multiuser detection, linear multiuser detection, adaptive mmse linear multiuser detection, blind mmse multichannel detection, decision-driven multiuser detectors, successive cancellation, performance analysis of successive cancellation, and multistage detection.

EECE 7331. Network Communications and Performance Engineering. 4 Hours.
Presents principles for the design and analysis of modern communications networks. Emphasis is on theoretical and practical concepts. Uses the concept of a layered network architecture as a framework for understanding the functions and services of reliable end-to-end communications. Analyzes different switching and multiplexing techniques within the context of network session requirements and network traffic characterization. Introduces performance modeling with intermediate-level problems in queuing theory including MG1 queues, simple queueing networks, the IPP, and the MMPP. Discusses models for transmission, encoding, and fundamental limitations of physical channels as motivation for the development of data-link-layer services. Presents correctness and performance analysis with respect to framing, error detection, and ARQ schemes. Discusses host-to-host communications as a problem of routing and addressing. Discusses routing, emphasizing correctness, stability, and performance of fundamental algorithms. Students gain insight into the problems of adapting traditional routing strategies to high-speed and wireless environments. Considers flow and congestion control strategies within the context of end-to-end session requirements and global network performance. Requires a working knowledge of C programming; an understanding of statistics, discrete-event simulation, and networking is recommended.

EECE 7332. Error Correcting Codes. 4 Hours.
Covers algebra and Golois field theory in detail, as well as linear block codes, Hamming codes, cyclic codes, their encoding and decoding algorithms, BCH and Reed-Solomon codes, the Berlekamp-Massey decoding algorithm, Fourier transform over finite fields, codes in the frequency domain, and frequency domain decoding techniques. Studies bounds on code performance and burst error correcting codes, convolutional codes, their properties, Viterbi algorithm, performance of the ML decoding, sequential decoding of convolutional codes, the Zigangirov-Jelinek algorithm, concatenated codes, array codes, BCJR and SOVA algorithms, turbo codes, iterative decoding schemes, Trellis coded modulation, low-density parity check codes, and coding for fading channels. Requires a knowledge of probability and digital communications.

EECE 7333. Spread Spectrum Communication Systems. 4 Hours.
Introduces the fundamental concepts of spread spectrum communication systems. Studies the basic theory of direct sequence (PN) and frequency hopping (FH) spread spectrum techniques. Topics include direct sequence code generation, acquisition, and tracking; and phase and Doppler tracking. Emphasis is on the performance of uncoded and coded spread spectrum communications in the presence of interference, jamming, and fading environments. Considers the low probability of interception/detection (LPI/LPD) characteristics of spread spectrum techniques in multiuser communication systems. Presents various practical applications of spread spectrum including IEEE 802.11b, HomeRF, and Bluetooth.
EECE 7334. Wireless Communications. 4 Hours.
Treats a diverse range of topics in wireless communications for applications such as cellular mobile radio, personal communication services, and wireless local area networks. Offers a working knowledge of both narrowband and wideband radio propagation models, including multipath fading and shadowing. Explores the system-level design of cellular networks, including the concepts of frequency reuse, channelization, handoff, power control, cell splitting, sectorization, and Erlang capacity. Covers modern multiple-access methods, including code-, space-, time-, and frequency-division multiple access. Compares coherent, differentially coherent, and noncoherent signaling techniques from the perspectives of spectral efficiency, bit error rate, and transceiver complexity. Explores both optimal and practical receiver designs and covers topics such as digital equalization and diversity techniques.

EECE 7335. Detection and Estimation Theory. 4 Hours.
Reviews vector space and stochastic concepts, sufficiency, unbiased estimation, Cramer-Rao bound, Rao-Blackwell theorem, Pitman efficiency, maximum likelihood estimation, Bayesian estimation, minimum mean squared error estimation, least squares estimation, and Gauss-Markov theorem. Topics include simple and composite hypotheses, Neyman-Pearson tests, uniformly most powerful tests, invariant tests, CFAR detection, Bayesian detection, minmax detection, nonparametric testing, sequential testing, and quickest detection.

EECE 7336. Digital Communications. 4 Hours.
Covers fundamentals of digital communications and coding and the basic structure of a communication system. Topics include modeling of information sources; entropy; rate distortion function; lossless and lossy source coding theorems; Huffman coding; Lempel-Ziv algorithm; scalar and vector quantization; digital modulation schemes and their spectral characterization including PAM, MPSK, QAM, OQPSK, MSK, pi/4-QPSK, CPFSK, CPM, and GMSK; and orthogonal, biorthogonal, and simplex signaling. Explores optimal receiver design and probability of error derivation for various systems. Covers noncoherent detection and DPSK systems and their performance. Discusses synchronization systems, analysis of PLL in the presence of noise, methods of timing recovery, channel capacity, and Shannon’s noisy channel coding theorem. Studies cutoff rate and its communication system design. Other topics include coding systems, linear block codes, soft and hard decision decoding, performance of linear block codes, cyclic codes, convolutional codes, Viterbi decoding, error probability bounds, concatenated codes, MAP decoding, Trellis code modulation, communication over band-limited channels, ISI, Nyquist conditions, raised cosine signaling, partial response signaling, equalization techniques, linear adaptive equalization, decision feedback equalizers, maximum likelihood sequence detection, and communication over fading channels.

EECE 7337. Information Theory. 4 Hours.
Discusses basic properties of entropy and mutual information, Shannon’s fundamental theorems on data compression and data transmission in the single-user case, binning, and covering lemmas. Topics include rate distortion theory, feedback in one-way channels, Slepian-Wolf coding of correlated information sources, source coding with side information at the receiver, multiple access channel and its capacity region, and the capacity region of the Gaussian multiple access channel. Also covers broadcast channels, superposition coding, and the capacity region of the degraded broadcast channel; performance and comparison of TDMA, FDMA, and CDMA systems from a theoretical point of view; capacity issues for time-varying channels and channels with memory; relation between information theory and statistics; Stein’s lemma; and large deviation theory.

EECE 7338. Local Area Networks and Interworking. 4 Hours.
Presents fundamental principles on the design and analysis of local area networks (LANs) and internetworking strategies. The traditional definition of a LAN is that it provides high-speed transmission within a limited geographic scope, and ownership is associated with the organization that uses and manages it. An alternative definition is that a LAN provides the physical and link-layer access point to an internetwork. LAN technology provides electrical, physical, and signaling specifications, as well as the rules for transmission on various shared or dedicated media. Today LANs can operate at speeds in the gigabits per second and may span great distances. Internetworking imposes a higher logical-layer abstraction that provides the protocols, algorithms, and devices for interconnecting a mesh of heterogeneous LANs and intermediate networks into an Internet. Guides students through the evolution of LAN technology, from the challenges addressed by engineers designing first- and second-generation LANs to present and future advances. Emphasizes basic algorithms and protocols used for media access control and performance evaluation. Discusses internetworking concepts related to the protocols used in the present-day Internet.

EECE 7339. Testing and Design for Testability. 4 Hours.
Encompasses the theoretical and practical aspects of digital systems testing and the design of easily testable circuits. Topics include defect and fault models, test generation for combinational and sequential circuits, testing measures and costs, functional and parametric test methods, design for testability, built-in self-test, and concurrent testing. Provides the foundations for developing test methods for digital systems and provides the techniques necessary to practice design for testability.

EECE 7340. Broadband Communications Networks. 4 Hours.
Covers the basic principles and fundamental design issues relevant to broadband communication networks and exposes students to current research problems. Broadband networks are designed to support a variety of services and applications. Topics range from SONET and ATM switching to high-speed network control. Other topics include characterization of network traffic and its implications on network design; traffic management, flow control, and congestion control including call admissions control, scheduling, and policing; quality of service-based routing; and multicast routing. Networking technologies reflect current research areas and implementations. Focuses on high-speed wide-area-networking (WAN) technologies including frame relay (FR), asynchronous transfer mode (ATM), and next-generation Internet architecture. Includes lectures, readings from relevant literature, and student presentations.

EECE 7344. Broadband Communications Networks. 4 Hours.
Covers state-of-the-art advanced topics in communications. Topics are selected from the areas of interest and research of the instructor. The prerequisites are determined by the instructor. May be repeated without limit.

EECE 7345. Special Topics in Communications 1. 4 Hours.
Covers state-of-the-art advanced topics in communications. Topics are selected from the areas of interest and research of the instructor. The prerequisites are determined by the instructor. May be repeated without limit.

EECE 7346. Special Topics in Communications 2. 4 Hours.
Covers state-of-the-art advanced topics in communications. Topics are selected from the areas of interest and research of the instructor. The prerequisites are determined by the instructor. May be repeated without limit.

EECE 7347. Special Topics in Communications 3. 4 Hours.
Covers state-of-the-art advanced topics in communications. Topics are selected from the areas of interest and research of the instructor. The prerequisites are determined by the instructor. May be repeated without limit.
EECE 7350. Software Engineering 1. 4 Hours.
Prepares students to parallel programming using intermediate-level C/MPI. Includes topics such as encapsulation, inheritance, and polymorphism. A software project is assigned that contrasts the differences between function-oriented and object-oriented design. Requires a working knowledge of C programming language.

EECE 7355. Digital Systems Design with Hardware Description Languages. 4 Hours.
Covers design, simulation, modeling, synthesis, verification, and implementation of complex digital systems using high-level computer hardware description languages (HDL), beginning with a description of digital system hierarchy and abstraction. Provides a brief overview of available design tools and simulation programs. Continues with a complete presentation of the standard VHDL hardware description language and how to use this language for design and verification of digital systems at different levels of abstraction. Includes the following topics: CPU design; synthesis of a large design; FPGA implementation of a complete design; and, for materializing this complete design, coding for synthesis, use of verification libraries, and how to program FPGAs and CPLDs. Uses advanced simulation, synthesis, and FPGA programming tools.

EECE 7351. Software Engineering 2. 4 Hours.
Continues EECE 7350. Focuses on a very specific issue, modular design of software. Explores issues of stepwise-refinement and top-down design in depth and considers organizational/data-flow issues.

EECE 7352. Computer Architecture. 4 Hours.
Provides additional readings from recent research in the field. Requires a survey of the current state of the art in processor architectures and provides students with the opportunity to go through the design process of VLSI engineering. Requires a working knowledge of C programming language.

EECE 7353. VLSI Design. 4 Hours.
Covers all aspects of VLSI design and engineering including VLSI design methodology; MOS transistors and circuits; CAD tools to create, extract, simulate, and evaluate physical layouts; CMOS fabrication process; evaluation and optimization of circuit area, power consumption, and propagation delay; CAD tools to design CMOS systems with standard cells; system clocking design and evaluation; the characteristics and limitations of CAD tools, such as simulation, placement, and routing; VLSI testing, fault models, test vector generation, and design for testability; design projects going through a complete VLSI design cycle; and a research project targeting a specific area of VLSI engineering. Requires a working knowledge of electronics and digital systems design.

EECE 7354. VLSI Architecture. 4 Hours.
Augments the physical-level VLSI design knowledge built in EECE 7353 by studying how to take advantage of VLSI technologies. Provides students with the opportunity to go through the design process of VLSI architectures with two architectural-level design projects. Prior project examples include the design and evaluation of FPGAs, application specific processors, and microprocessors. Emphasizes performance and cost tradeoffs and decision making in these projects. Lectures provide theories and discussions to support these design projects that include a brief review of VLSI design methodology, pipelining and parallel processing in VLSI processors, interconnection between VLSI processing units, VLSI-oriented algorithms and applications, VLSI architecture synthesis, such special VLSI architectures as synchronous and asynchronous processor arrays and massively parallel fine-grained processor arrays, and reconfigurable VLSI architectures.
EECE 7360. Combinatorial Optimization. 4 Hours.
Introduces combinatorial optimization, an emerging field that combines techniques from applied mathematics, operations research, and computer science to solve optimization problems over discrete structures. Emphasizes problems that arise in the areas of electrical and computer engineering including VLSI, computer-aided design, parallel computing, computer architecture, and high-performance compiling. Covers the foundations of algorithm analysis including asymptotic notation and complexity theory, and a range of optimization techniques including divide and conquer, local optimization, dynamic programming, branch and bound, simulated annealing, genetic algorithms, approximation algorithms, integer and linear programming, matroid theory, and greedy algorithms. Considers the efficient generation of optimal solutions, the development and evaluation of heuristics, and the computation of tight upper and lower bounds.

EECE 7361. Digital Hardware Synthesis. 4 Hours.
Introduces techniques and tools for the automatic synthesis of digital systems. Focuses on algorithms for translating a high-level specification into an implementation. Covers a brief introduction to hardware description languages (HDL), automatic translation of the HDL to an intermediate format, architectural synthesis of the register transfer-level implementation, automatic state machine synthesis, and logic synthesis. Requires a completed research project in the automatic synthesis of digital designs.

EECE 7362. Network Computing. 4 Hours.
Studies the theory and practice of analysis and design of network-based computing systems in which programs can be executed adaptively in a changeable computing environment, such as clusters of workstations or PCs. Includes distributed shared memory; cache coherence; snooping; locking; atomic exchange; deadlock; message passing interface (MPI-1 and MPI-2); point-to-point communication; collective communications; and groups, contexts, and communicators. Studies process topologies (virtual topologies), network of workstations (NOW), protocols and programming, scalable coherent interface (SCI) using point-to-point connection of distributed shared memory (DSM) machine, SCIs, cache coherence protocol, clusters of workstations based on SCI, scalable networks for data processing topologies, wormhole routing, deadlock avoidance, scalability, message format, fault tolerance, arbitration policies, and performance evaluation of network-based computing systems. Includes ServerNet, myrinet, and clusters of advanced workstations case studies.

EECE 7363. Interconnection Network for Multicomputers. 4 Hours.
Covers static interconnection networks, topological properties of static interconnection networks, dynamic networks, routing in multicomputer networks, path setup, path selection (deterministic and adaptive), network flow control (store and forward, virtual cut-through, and wormhole), deadlocks in routine (virtual networks), multicasting and broadcasting in static networks (one-to-all, all-to-all broadcasting, and spanning graphs), fault tolerance and reliability of interconnection networks, and performance metrics for different topologies (throughput, message latency, max delivery time, saturation point, hot spots, stable state, average link usage, and dynamic hot spots identification). Also studies modules for a realization of interconnection networks, Node's architecture and organization, based on 32- and 64-bits CPU. Case studies include different topologies and routine strategies.

EECE 7364. Mobile and Wireless Networking. 4 Hours.
Introduces the fundamental techniques and protocols in first- and second-generation, and emerging third-generation, wireless systems. Examines how mobility affects networks, systems, and applications. Mobility of devices and end-users has behavioral implications at all layers of the Internet protocol stack, from the MAC layer up through the application layer. Handling mobility efficiently requires more information sharing between network layers than is typically considered. Topics include cellular system, medium access control protocols for wireless systems, mobility management and signaling within mobile networks, common air interfaces (AMPS, IS-136, IS-95, or GSM), wireless data networking (CDPD), ad hoc networks, Bluetooth, Mobile IP, and PCS systems. Also introduces students to the problems and current research in the provision of quality of service (QoS) in wireless networks. Methodology includes lectures, textbooks, and emphasis on readings from relevant literature.

EECE 7365. Distributed Systems. 4 Hours.
Covers fundamentals of distributed systems, distributed computing models, client-server computing, remote procedure calls, distributed file and directory services, distributed systems design and implementation issues, reliability and availability, security, overview of computer networks, and case studies in distributed systems. Requires knowledge of operating systems.

EECE 7366. Special Topics in Computer Engineering 1. 4 Hours.
Covers topics in computer engineering not studied in other courses. Subject matter may change from year to year. Topics may include computer architecture, design automation, parallel computing, VLSI, networks, compilers, algorithm design, fault-tolerance, and testing. May be repeated without limit.

EECE 7367. Robotics and Automation Systems. 4 Hours.
Explores methods of operation of general-purpose and industrial manipulator systems, kinematic and dynamic models of mechanical arms, joint solutions and motion characteristics, trajectory planning, arm control through coordinate transformations, classical feedback methods and modern closed-loop control techniques, and real-time control of robotic systems.

EECE 7368. High-Level Design of Hardware-Software Systems. 4 Hours.
Presents state-of-the-art methods, tools, and techniques for system-level design and modeling of complete multiprocessor systems from specification down to implementation across hardware-software boundaries. Recognizes that system complexities are growing exponentially, driven by ever-increasing application demands and technological advances that allow one to put complete multiprocessor systems on a chip (MPSoCs). System-level design that jointly covers hardware and software is one approach to address the associated complexities in the design process and the market pressures. Using system-level design languages (e.g., SpecC, SystemC), offers students an opportunity to specify, simulate, analyze, model, and design hardware-software systems based on examples of typical embedded applications. Requires working knowledge of C/C++, algorithms, and data structures.
EECE 7370. Advanced Computer Vision. 4 Hours.
Offers students an opportunity to obtain practical knowledge in computer vision and to develop skills for being a successful researcher in this field. The goal of the field of computer vision is to make useful decisions about real physical objects and scenes based on sensed images. Achieving this goal requires obtaining and using descriptions (models) of the sensors and the world. Computer vision is an exciting field that builds on very diverse disciplines such as image processing, statistics, pattern recognition, control theory and system identification, physics, geometry, computer graphics, and machine learning. Course material includes state-of-the-art in the field, current research trends, and algorithms and their applications, with an emphasis on the mathematical methods used.

EECE 7374. Fundamentals of Computer Networks. 4 Hours.
Focuses on fundamental concepts of computer networks with a particular focus on the Internet. Covers the language and practices of computer networking at all levels of various network protocol stacks. Basic concepts include general definitions and network organization. Delves into the protocol stack following a top-down approach, covering the application layer (with Internet applications); the transport layer, with its functions and services (e.g., the TCP protocol); the network layer, with a discussion on forwarding and routing and the IP protocol; and the data link layer, with an emphasis on multiaccess. Concludes with current topics including networks analysis/modeling, physical layer/cross-layer design, emerging technologies, and mobility.

EECE 7376. Operating Systems: Interface and Implementation. 4 Hours.
Covers fundamentals of operating systems (OS) design, including theoretical, OS-generic design considerations as well as the practical, implementation-specific challenges in the development of a real OS. Requires proficiency in the C programming language, the GNU tool set for C programming, and debugging in Unix operating systems.

EECE 7387. Special Topics in Computer Networks. 4 Hours.
Covers current aspects of computer communications networks not covered in previous courses. Subject matter may change from year to year. Topics may include wireless ad hoc networks, quality of service in wireless networks, network and Internet security, modeling and analysis of network traffic and mobility, and advanced queuing. May be repeated without limit.

EECE 7388. Special Topics in Computer Engineering. 2. 4 Hours.
Covers topics in computer engineering not studied in other courses. Subject matter may change from year to year. Topics may include computer architecture, design automation, parallel computing, VLSI, networks, compilers, algorithm design, fault tolerance, and testing. May be repeated without limit.

EECE 7389. Robot Vision and Sensors. 4 Hours.
Examines methods of acquisition, representation, and processing of real-world information for robot control. Focuses on the different aspects of robot vision. Topics include projection, lens distortion, image noise reduction, texture, edge-based systems, region-based systems, Hough space, matched filtering, object modeling, stereo vision, motion, and optical flow. Robot sensors covers a variety of sensor types including force/torque, proximity, and tactile sensors.

EECE 7390. Computer Hardware Security. 4 Hours.
Presents the foundations for understanding the new and evolving area of hardware security and trust, which have become major concerns for national security over the past decade. Coverage includes security and trust issues in all types of electronic devices and systems, such as ASICs, COTS, FPGAs, microprocessors/DSPs, and embedded systems. Topics encompass the state-of-the-art research fronts such as hardware support for system security, hardware implementations of security primitives, physical attacks and tamper resistance, analysis and practices of side-channel attacks and countermeasures, security for RFID tags, physically unclonable functions, design for hardware trust, hardware Trojan detection and localization, etc. Requires solid knowledge of digital system design, integrated circuits synthesis flow, and embedded systems recommended.

EECE 7393. Analysis and Design of Data Networks. 4 Hours.
Introduces fundamental concepts and approaches for the analysis and design of data networks. Covers delay models, multi-access communication, scheduling, routing, congestion control, and network coding. Presents analytical techniques such as basic queueing theory, queuing networks, optimization, stochastic control, and distributed algorithms. Requires knowledge of basic probability.

EECE 7394. Networks and Systems Security. 4 Hours.
Focuses on network and systems security, providing a broad overview of a diverse range of topics across these two domains. Builds from foundational security models and principles to examine attacks and defenses in systems code, the Web, and mobile platforms. Emphasizes practical techniques in support of the high-level goal to impart the “attacker’s mind-set.” Requires comfort with UNIX/Linux systems; networking (TCP/IP); C and/or C++; and Python, Ruby, or another scripting language.

EECE 7397. Advanced Machine Learning. 4 Hours.
Covers topics in advanced machine learning. Presents materials in the current machine learning literature. Focuses on graphical models, latent variable models, Bayesian inference, and nonparametric Bayesian methods. Seeks to prepare students to do research in machine learning. Expects students to read conference and journal articles, present these articles, and write an individual research paper. CS 7140 and EECE 7397 are cross-listed.

EECE 7398. Special Topics. 4 Hours.
Covers topics of interest to the faculty member conducting this class for advanced study. May be repeated without limit.

EECE 7399. Preparing High-Stakes Written and Oral Materials. 4 Hours.
Focuses on how to think through and develop critical materials that have high-stakes impact. These could include writing a compelling technical paper or a winning proposal for external funding, making a compelling oral presentation for a job interview or thesis defense, or presenting arguments to a CEO about strategic directions for a complex project. Includes hands-on exercises and class exercises around challenges defined by the instructor or by guest lecturers.

EECE 7400. Special Problems in Electrical Engineering. 1-4 Hours.
Offers theoretical or experimental work under individual faculty supervision. May be repeated without limit.

EECE 7674. Master’s Project. 4 Hours.
Offers analytical and/or experimental work leading to a written report and a final short presentation by the end of the semester.

EECE 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
EECE 7990. Thesis. 4-8 Hours.
Offers analytical and/or experimental work conducted under the auspices of the department. May be repeated once.

EECE 7996. Thesis Continuation. 0 Hours.
Offers analytical and/or experimental work conducted under the auspices of the department.

EECE 8400. Advanced Seminar. 4 Hours.
Offers treatment of advanced topics of research to include theoretical as well as experimental aspects. Requires reports and discussion of selected technical articles in professional journals and symposia.

EECE 8960. Exam Preparation—Doctoral. 0 Hours.
Offers students an opportunity to prepare for the PhD qualifying exam under faculty supervision. Requires permission of advisor; intended for students who have completed all required PhD course work and have not yet achieved PhD candidacy; students who have not completed all required PhD course work are not allowed to register for this course. May be repeated once.

EECE 8984. Master’s Research. 1-8 Hours.
Offers investigation of master’s research topic under supervision of individual faculty member. May be repeated without limit.

EECE 8986. Research. 0 Hours.
Offers students an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

EECE 9000. PhD Candidacy Achieved. 0 Hours.
Indicates successful completion of program requirements for PhD candidacy.

EECE 9803. PhD Seminar. 0 Hours.
Requires the student to present a seminar to the Department of Electrical Engineering on a subject related to his/her PhD thesis. The thesis supervisor coordinates the seminar. Requires passing of PhD qualifying exam.

EECE 9984. Doctoral Research. 1-8 Hours.
Investigates doctoral research topic under supervision of individual faculty member. May be repeated without limit.

EECE 9986. Research. 0 Hours.
Offers students an opportunity to conduct full-time research under faculty supervision. May be repeated without limit.

EECE 9990. Dissertation. 0 Hours.
Offers theoretical and/or experimental work conducted under the auspices of the department. Required to be taken in two consecutive semesters. Includes attendance at Distinguished Lecture Series (DLS). May be repeated once.

EECE 9996. Dissertation Continuation. 0 Hours.
Offers continued dissertation work conducted under the supervision of a departmental faculty member. Includes attendance at Distinguished Lecture Series (DLS). Requires prior completion of EECE 9990 twice. May be repeated without limit.

ELE 0799. Professional Engineering Review: Electrical. 3.2 Hours.
Offers students an opportunity to prepare for the Principles and Practice (PE) License Examination in Electrical Engineering and Computer Engineering. Reviews electrical engineering fundamentals in addition to the important advanced topics common to all electrical engineers. Includes sample multiple-choice problems and reviews them in class. The course concludes prior to the state exam.

EEET 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EEET 2000. Circuits 1. 3 Hours.
Covers the design and analysis of practical DC circuits. Topics include basic concepts; resistors; capacitors; inductors; series and parallel circuits; theorems of Norton and Thevenin; Ohm’s Law; Kirchhoff’s laws; loop, nodal and mesh analysis; amplifiers; transient analysis of RL, RC, and RLC circuits; power and energy; transformers; power sources; relays; switches; and SPICE simulation.

Accompanies EEET 2000. Covers topics from the course through various experiments.

EEET 2100. Circuits 2. 3 Hours.
Covers the design and analysis of practical AC circuits. Topics include network theorems; phasors; equivalent circuits; sinusoidal sources; steady-state analysis; steady-state power; impedance; admittance and frequency response; resonance; Bode plots; filters; power transfer; average, reactive, and complex power; and SPICE simulation.

EEET 2101. Lab for EEET 2100. 2 Hours.
Accompanies EEET 2100. Covers topics from the course through various experiments.

EEET 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EEET 3100. Electronics 1. 3 Hours.
Covers the theory and practical uses of active semiconductors. Topics include the operating characteristics of diodes, field-effect transistors, bipolar junction transistors, MOS transistors, and op amps; the analysis and design of single-stage amplifiers, diode circuits, and transistor circuits; rectifier circuits, clamping and clipping circuits, voltage multipliers, Zener regulators, temperature measuring, discrete amplifiers, feedback, basic op amp circuits, and switching circuits. SPICE is used to simulate circuits.

EEET 3101. Lab for EEET 3100. 2 Hours.
Accompanies EEET 3100. Covers topics from the course through various experiments.

EEET 3200. Electronics 2. 3 Hours.
Covers advanced analog devices and circuits and their uses. Topics include operational amplifiers, power transistors, timers, linear voltage regulators, switching regulators, sensors, advanced op amp circuits, active filters, oscillator circuitry, function generator, comparators, and timer circuitry. SPICE is used to simulate circuits, and data sheet analysis is included.

EEET 3201. Lab for EEET 3200. 2 Hours.
Accompanies EEET 3200. Covers topics from the course through various experiments.

EEET 3300. Digital Logic. 3 Hours.
Covers the design, analysis, and simulation of digital circuits. Topics include number systems, Boolean algebra, logic gates, combinational logic, circuit simplification, multiplexers, demultiplexers, encoders, decoders, latches, flip-flops, registers, counters, synchronous sequential circuits, and read-only (ROM) and random-access memory (RAM). Includes digital logic circuitry based on RTL, TTL, ECL, and CMOS logic families and the simulation of digital circuits using a hardware description language.
EET 3301. Lab for EET 3300. 2 Hours.
Accompanies EET 3300. Covers topics from the course through various experiments.

EET 3400. Digital Electronics. 3 Hours.
Covers concepts needed to implement digital circuits. Topics include digital logic circuitry based on RTL, TTL, ECL, and CMOS logic families; semiconductor, magnetic, and optical memory; read-only memory (ROM); random-access memory (RAM); programmable logic arrays (PLAs); programmable logic; the simulation of digital circuits using a hardware description language; and tools for electronic design automation.

EET 3401. Lab for EET 3400. 2 Hours.
Accompanies EET 3400. Covers topics from the course through various experiments.

EET 3750. Linear Systems. 3 Hours.
Covers the basic theory of continuous and discrete systems, emphasizing linear time-invariant systems. Considers the representation of signals and systems in both the time and frequency domain. Topics include linearity, time invariance, causality, stability, convolution, system interconnection, sinusoidal response, and the Fourier and Laplace transforms for the discussion of frequency-domain applications. Analyzes sampling and quantization of continuous waveforms (A/D and D/A conversion), leading to the discussion of discrete-time FIR and IIR systems, recursive analysis, and realization. The Z-transform and the discrete-time Fourier transform are developed and applied to the analysis of discrete-time signals and systems.

EET 3800. Control Systems. 3 Hours.
Covers the analysis of feedback control systems under both transient and steady-state conditions. Topics include the application of Laplace transforms in the formulation of block diagrams and transfer functions in control systems modeling; the performance characteristics of feedback control systems; and the analysis of the stability of feedback control systems using Routh-Hurwitz criterion. Uses frequency plots and measurement techniques to evaluate steady-state responses.

EET 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EET 4100. Power Systems. 3 Hours.
Presents the theory of electrical power generation and distribution. Covers single and multiphase systems, various electrical configurations (delta, wye), and sequence networks. Examines the electrical power system—from the power generation plant, to the high-voltage transmission lines, to the street-level transmission, to the power delivered to businesses and homes, and, finally, to power supplied to the load.

EET 4110. Electromagnetics. 3 Hours.
Covers the principles and applications of electromagnetics. Topics include electrostatics; magnetostatics; time-varying fields; Maxwell’s equations; Poynting theorem; transmission lines; and the propagation, reflection, and refraction of plane waves, with applications to wave guides, resonators, optical fibers, and radiation and elementary antennas.

EET 4120. Digital Signal Processing. 3 Hours.
Covers the theory and practice of digital signal processing. Topics include the characteristics of discrete signals and systems; fundamental principles of convolution, linearity, and duality; sampling theory; transform methods, including the Z, Fourier, and discrete Fourier transforms; digital filter design; quantization effects in digital signal processing; and computational techniques such as the fast Fourier transform algorithm.

EET 4130. Electrical Machines. 3 Hours.
Covers the design and analysis of electric machines, including magnetic circuits, transformers, DC machines, AC machines, synchronous machines, induction machines, stepper motors, generators, controllers, alternators, and direct-current machines. Topics include efficiency, energy conservation, power factor, magnetism, electromagnetic force, phasor diagrams, three-phase circuits, and rotating magnetic fields.

EET 4140. Communication Systems. 3 Hours.
Covers the fundamentals of digital communication systems. Topics include sampling, aliasing, interpolation, noise, digital communication systems, transmitters, receivers, multiplexing and demultiplexing, pulse amplitude modulation, pulse frequency modulation, pulse code modulation, pulse width modulation, and analog-to-digital and digital-to-analog converters. Surveys characteristics of internet, microwave, satellite, optical, cell phone, and wireless communication systems.

EET 4950. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

EET 4955. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

EET 4983. Topics. 1-4 Hours.
Covers special topics in electrical engineering technology. May be repeated without limit.

EET 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EET 4991. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

EET 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

EET 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

EET 4994. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

EET 4995. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

EET 4996. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major.

Emergency Medical Services - CPS (EMS)
Energy Systems (ENSY)

ENSY 5000. Fundamentals of Energy System Integration. 4 Hours.
Presents fundamental issues of successfully integrating and implementing energy systems. Exposes students to combined heat and power strategies (cogeneration system), strategies of incorporating renewable with nonrenewable energy sources, thermoeconomics, and carbon sequestration techniques. Includes energy, exergy, and thermoeconomic cost factors in the presented case studies. Explores the effects of public policy, regulations, and financial operations on selecting energy technology. Students are given case studies to illustrate the complexity of implementing energy systems and are expected to complete a major project involving proposing an energy system. Emphasizes that successful implementation of energy systems requires both a technical and an economic solution. Requires calculus-based physics and chemistry.

ENSY 5050. Fundamentals of Thermal Science 1. 4 Hours.
Introduces and reviews thermodynamic properties such as temperature, pressure, energy, enthalpy, and entropy. Defines work and heat interactions and calculates the amount of energy transferred during thermodynamic processes. Introduces the first and second laws of thermodynamics and concepts of thermodynamic equilibrium. Discusses mass, energy, and entropy balance relations as well as conversion devices, such as turbine, compressors, pumps, valves, and energy exchangers. Studies simple power plants, refrigeration, heat (energy) pumps, and stationary gas turbine systems. Presents and reviews fundamentals of calculus, such as limit, differentiation, integration, power series, vector spaces, and multivariable functions needed for thermodynamic analysis.

ENSY 5060. Fundamentals of Thermal Science 2. 4 Hours.
Studies fundamental principles in fluid mechanics and thermal systems analysis. Topics include hydrostatics (pressure distribution, forces on submerged surfaces, and buoyancy); Newton’s law of viscosity; integral forms of basic laws (conservation of mass, momentum, and energy); pipe flow analysis; concept of boundary layer; and drag coefficient. Presents Navier-Stokes equations as differential forms of conservative properties. Introduces theories of thermal energy transport, including conduction, convection, and thermal radiation; the design of thermal systems; and fundamentals of calculus, such as linear algebra, vector fields, and curvilinear coordinate systems required for introducing concepts of fluid dynamics and heat transfer. Discusses surface and volume integrals, conservative vector fields, and surface flux. Green’s, divergence, and Stokes theorems are introduced for vector and scalar fields.

ENSY 5100. Hydropower. 4 Hours.
Covers fundamentals of hydropowered development projects and their relevant design parameters. Emphasizes harnessing the hydro-energy potentials of both natural and man-made reservoirs. Reviews hydro- and electromechanical equipment and civil structure. Addresses selection procedure and design parameters of the equipment and structure.

ENSY 5200. Energy Storage Systems. 4 Hours.
Explores the various energy storage technologies, their working, and their practical applications. Focuses on the state-of-the-art review of current and most recent technologies. Offers students an opportunity to explore various innovations in the field of energy storage that can be helpful for fulfilling our current energy storage needs. Covers many different energy storage systems such as mechanical, chemical, electrochemical, thermal, thermochemical, etc.

ENSY 5300. Electrochemical Energy Storage. 4 Hours.
Covers the basics of electrode kinetics and thermodynamics as applied to electrochemical energy storage systems, as well as batteries and capacitors for traction and stationary power. Discusses the chemical structure of electrodes and electrolytes and practical battery construction.

ENSY 5400. Power Plant Design and Analysis. 4 Hours.
Reviews the fundamental laws of thermodynamics and balance equations for mass, energy, exergy, and entropy. Studies thermochemistry, chemical equilibrium, fuels and combustion, steam power plant cycle, gas turbine systems, thermo-economics, nuclear power plants, and energy recovery.

ENSY 5585. Wind Energy Systems. 4 Hours.
Introduces wind energy and its applications. Integrates aerodynamics of wind turbine design with the structures needed to support them. Covers types of wind turbines, their components, and related analyses; airfoil aerodynamics; concepts of lift, drag, pitching moment, circulation, angle of attack, and stall; laminar and turbulent boundary layers and separation concepts; fundamental conservation equations; Bernoulli’s, Euler’s, and Navier-Stokes equations and their applications; Betz limit; computational fluid dynamics and its application for flow over typical airfoils; compressibility and elements of one-dimensional gas dynamics; wind resource; wind climatology and meteorological data; turbine tower and structural engineering aspects of turbines; vibration problems; aeroelastic phenomena in turbines; small wind turbines and vertical axis wind turbines; and introduces environmental and societal impacts and economic aspects.

ENSY 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENSY 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

ENSY 6965. Co-op Work Experience Abroad. 0 Hours.
Provides eligible students with an opportunity for work experience abroad. May be repeated without limit.

ENSY 7374. Special Topics in Energy Systems. 4 Hours.
Offers topics of interest to the staff member conducting the course for advanced study. May be repeated without limit.

ENSY 7440. Energy Systems Leadership Challenge Project 1. 4 Hours.
Offers students an opportunity to develop and present a plan for the implementation of energy systems. Exposes students to combined heat and power strategies (cogeneration system), strategies of incorporating renewable with nonrenewable energy sources, thermoeconomics, and carbon sequestration techniques. Includes energy, exergy, and thermoeconomic cost factors in the presented case studies. Explores the effects of public policy, regulations, and financial operations on selecting energy technology. Students are given case studies to illustrate the complexity of implementing energy systems and are expected to complete a major project involving proposing an energy system. Emphasizes that successful implementation of energy systems requires both a technical and an economic solution. Requires calculus-based physics and chemistry.

ENSY 7441. Energy Systems Leadership Challenge Project 2. 4 Hours.
Continues the energy systems program.

ENSY 7442. Energy Systems Leadership Challenge Project 3. 4 Hours.
Continues the energy systems program.

Continues the energy systems program.

ENSY 7444. Energy Systems Leadership Challenge Project 5. 4 Hours.
Continues the energy systems program.

ENSY 7380. Energy Systems Leadership Challenge Project 6. 4 Hours.
Continues the energy systems program.

ENSY 7381. Energy Systems Leadership Challenge Project 7. 4 Hours.
Continues the energy systems program.

ENSY 7382. Energy Systems Leadership Challenge Project 8. 4 Hours.
Continues the energy systems program.

Continues the energy systems program.

ENSY 7384. Energy Systems Leadership Challenge Project 10. 4 Hours.
Continues the energy systems program.

ENSY 7385. Energy Systems Leadership Challenge Project 11. 4 Hours.
Continues the energy systems program.

ENSY 7386. Energy Systems Leadership Challenge Project 12. 4 Hours.
Continues the energy systems program.

ENSY 7387. Energy Systems Leadership Challenge Project 13. 4 Hours.
Continues the energy systems program.

Continues the energy systems program.

ENSY 7389. Energy Systems Leadership Challenge Project 15. 4 Hours.
Continues the energy systems program.

Continues the energy systems program.

ENSY 7391. Energy Systems Leadership Challenge Project 17. 4 Hours.
Continues the energy systems program.

ENSY 7392. Energy Systems Leadership Challenge Project 18. 4 Hours.
Continues the energy systems program.

Continues the energy systems program.

ENSY 7394. Energy Systems Leadership Challenge Project 20. 4 Hours.
Continues the energy systems program.
ENCP 6945. Master’s Project. 4 Hours.
Offers theoretical or experimental work under individual faculty supervision.

ENSY 7978. Independent Study. 1-4 Hours.
Offers an individual effort in an area selected by student and advisor and approved by the Department Discipline Committee, resulting in a definitive report. May be repeated without limit.

Engineering Cooperative Education (ENCP)

ENCP 6000. Career Management for Engineers. 1 Hour.
Designed to introduce graduate engineering students to the cooperative education program and maximize their learning by seeking to help them be more intentional about learning in co-op and in the transfer of that knowledge and experience to and from their academic program and throughout their entire careers. Offers students an opportunity to develop career goals and be able to identify and justify what they need to learn through their co-op experience and entire careers. Offers students an opportunity to engage in readings, exercises, and discussions to acquire the tools to be able to continually assess what they already know, what they think they know, what they need to know, and what they would like to know in relation to achieving their career goals.

ENCP 6100. Introduction to Cooperative Education. 1 Hour.
Introduces graduate students to the Cooperative Education Program and offers them an opportunity to develop job-search and career-management skills. Students perform discipline-specific assessments of their workplace skills, interests, and values and discuss how they impact personal career choices. Covers how to develop field/industry-specific materials, including a professional-style résumé and cover letter, and introduces students to career portfolios. Additional topics include ethics, professional behaviors, workplace culture, and proper interviewing techniques. Familiarizes students with workplace issues relative to their field of study while outlining co-op policies, procedures, and expectations of the Cooperative Education Program and employers.

ENCP 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENCP 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

Engineering Interdisciplinary (ENGR)

ENGR 0600. Preparation for Professional and Academic Engineering Success in the United States. 0 Hours.
Designed for international engineering graduate students who are learning about living, working, and studying in the United States. The goal is to create experiences that assist the student toward biculturalism. Offers students an opportunity to obtain an in-depth understanding of the American people, the university culture, and the professional engineering environments they experience both during their program at Northeastern and after graduation. Examines the importance of critical thinking skills, creativity, and individualism as core values of the American spirit. At the same time, introduces language skills necessary for successful communication at the university, in engineering settings, and in the wider culture.

ENGR 5670. Sustainable Energy: Materials, Conversion, Storage, and Usage. 4 Hours.
Examines, in this interdisciplinary course, modern energy usage, consequences, and options to support sustainable energy development from a variety of fundamental and applied perspectives. Emphasizes both (1) physical and chemical processes in materials for the conversion of energy and (2) how to design a system with renewable energy for applications such as electricity generation and transmission. Takes a systems analysis point of view. Topics may include energy conservation; fossil fuels; and energy conversion methods for solar, geothermal, wind, hydro, bioenergy, electrochemical, and similar methods.

ENGR 6150. Nanotechnology in Engineering. 4 Hours.
Explores a wide range of new technologies based on, or influenced by, breakthroughs in nanoscience. Nanotechnology, the refinement of functional properties of materials, devices, or systems at least one dimension smaller than 100 nm with a general goal of engineering new or enhanced macroscopic properties from nanostructure or nanoscale materials and components, has revolutionized science and its impact on society. Nanotechnologies include, but are not limited to, spintronics, quantum computing, carbon nanotube electronics, nanoparticle cancer remediation strategies, biomolecular electronics, and nanomachines. Through review of the scientific literature, classroom lecture, seminars by international leaders of nanotechnology, and student team and individual projects, the student has an opportunity to develop an in-depth understanding of one area of interest in this field.

ENGR 6600. Early-Stage Technology—Commercialization Opportunity Assessment. 4 Hours.
Focuses on real-world product development and commercialization in engineering. Organized with several interdisciplinary teams consisting of business students and engineering students, supported by technical and commercial mentors from industry and academia. Through their engagement with industry, offers students an opportunity to work on confidential intellectual property and early concept/product-idea generation.
ENGR 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENGR 7978. Independent Study. 1-4 Hours.
Offers theoretical or experimental work under individual faculty supervision. May be repeated without limit.

ENGR 7990. Thesis. 1-8 Hours.
Offers analytical and/or experimental work conducted under the direction of the faculty in fulfillment of the requirements for the degree. Requires first-year students to attend a graduate seminar program that introduces the students to the methods of choosing a research topic, conducting research, and preparing a thesis. Requires successful completion of the seminar program. May be repeated without limit.

ENGR 7996. Thesis Continuation. 0 Hours.
Offers continuing master’s thesis supervision under individual faculty supervision.

ENGR 8986. Research Fieldwork. 0 Hours.
Offers students an opportunity to conduct research under faculty supervision. May be repeated up to 21 times.

ENGR 9700. Doctoral Fieldwork. 0 Hours.
Offers students an opportunity to pursue experiential research outside the classroom and outside the university. Engineering PhD students only. May be repeated up to two times.

ENGR 9701. Engineering Teaching Practicum. 0 Hours.
Offers intermediate or terminal-level doctoral candidates a teaching assignment under the guidance of a faculty member. Typical activities include preparing and teaching recitations; preparing and teaching laboratory sessions; holding office hours; preparing and grading quizzes, problem sets, and other assignments; and assisting the instructor with other activities associated with teaching a course. All nonnative English speakers should conform to the university language requirements for teaching assistants. May be repeated up to five times.

**Engineering Leadership (ENLR)**

ENLR 5121. Engineering Leadership 1. 2 Hours.
Covers elements of engineering practices such as product engineering (system design and engineering, integration, and documentation); engineering leadership (team building, communication, leadership styles, ethical behavior, and conflict resolution); market assessment (engineering economics, business plans, intellectual property, risk assessment, and mitigation); and engineering excellence (quality, reliability, serviceability, manufacturability, procurement, and problem solving). Requires work/training with a sponsoring organization or employer to improve a process or develop a project that is of significant value to the organization and demonstrates a quantifiable market impact while enhancing the student’s technological and engineering depth and fostering the student’s leadership development.

ENLR 5122. Engineering Leadership 2. 2 Hours.
Continues the examination of engineering practices begun in ENLR 5121. Requires work/training with a sponsoring organization or employer to improve a process or develop a project that is of significant value to the organization and demonstrates a quantifiable market impact while enhancing the student’s technological and engineering depth and fostering the student’s leadership development.

ENLR 5131. Scientific Foundations of Engineering 1. 2 Hours.
Presents the fundamental science underlying engineering disciplines. Develops a conceptual framework to understand interdisciplinary engineering practice and to make informed, back-of-the-envelope, quantitative estimates. Covers topics such as principles of mechanics and mechanics of materials, wave physics, quantum physics, statistical and thermal physics, fluid physics, Maxwell’s equations and constitutive relations, and topics in chemistry and biology.

ENLR 5132. Scientific Foundations of Engineering 2. 2 Hours.
Continues the examination of fundamental science begun in ENLR 5131.

ENLR 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENLR 7400. Special Problems in Engineering Leadership. 1-4 Hours.
Offers theoretical or experimental work under individual faculty supervision.

ENLR 7440. Engineering Leadership Challenge Project 1. 4 Hours.
Offers students an opportunity to develop and present a plan for the demonstration of a marketable technology product or prototype. This course is the first half of a thesis-scale project in technology commercialization. Requires work/training with a sponsoring organization or employer to improve a process or develop a project that is of significant value to the organization and demonstrates a quantifiable market impact while enhancing the student’s technological and engineering depth and fostering the student’s leadership development.

ENLR 7442. Engineering Leadership Challenge Project 2. 4 Hours.
Continues ENLR 7440, a thesis-scale project in technology commercialization. Offers students an opportunity to demonstrate their development of a marketable technology product or prototype and produce a written documentary report on the project to the satisfaction of an advising committee. Requires work/training with a sponsoring organization or employer to improve a process or develop a project that is of significant value to the organization and demonstrates a quantifiable market impact while enhancing the student’s technological and engineering depth and fostering the student’s leadership development.

ENLR 7444. Engineering Leadership Challenge Project Continuation. 0 Hours.
Continues ENLR 7442, a thesis-scale project in technology commercialization. Requires work/training with a sponsoring organization or employer to improve a process or develop a project that is of significant value to the organization and demonstrates a quantifiable market impact while enhancing the student’s technological and engineering depth and fostering the student’s leadership development.

**Engineering Management (EMGT)**

EMGT 5220. Engineering Project Management. 4 Hours.
Examines the theory and practice of managing projects. Explores human, mathematical, entrepreneurial, managerial, and engineering aspects of project management. The systems development life cycle is the framework for the course. Addresses needs analysis, requirements definition, design, and implementation in the context of project management. Introduces mathematical and software tools for planning, monitoring, and controlling projects.
EMGT 5300. Engineering/Organizational Psychology. 4 Hours.
Offers an analysis of the purpose and functioning of organizations as the basic networks for achieving goals through coordination of effort, communication, and responsibility. Studies the role and function of engineering organizations based on modern behavioral science concepts as well as the application of psychology to industry relative to human relations, group dynamics, tests and measurements, personnel practices, training, and motivation. Examines the evolution of the learning organization and its role in the management of R&D and technology, the influence of the rapid changes in technology, and the globalization of the marketplace through group-oriented case studies.

EMGT 5374. Special Topics in Engineering Management. 4 Hours.
Offers topics of current interest in engineering management. May be repeated up to four times.

EMGT 6225. Economic Decision Making. 4 Hours.
Explores economic modeling and analysis techniques for selecting alternatives from potential solutions to an engineering problem. Considers measures of merit, such as present worth, annual worth, rate of return, and benefit/cost techniques. Examines recent techniques of economic analysis, especially the tools of decision making. Explores decisions under uncertainty. Studies the causes of risk and uncertainty, and examines ways to change and influence the degree of risk and uncertainty through sensitivity analysis, expectation-variance criterion, decision tree analysis, statistical decision techniques, and multiple attribute decision making through group case studies.

EMGT 6305. Financial Management for Engineers. 4 Hours.
Examines the issues and processes of short-term financing on industrial firms, financial analysis of cases, supplemented by readings to develop familiarity with sources and uses of working capital as well as the goals and problems involved in its management. Also covers the analysis necessary for such long-term financial decisions as issuance of stock or bonds; contracting of leases or loans, and financing of a new enterprise; mergers, capital budgeting, the cost of capital, and the valuation of a business. Examines financial statement ratio analysis along with the use of the capital asset pricing model as it relates to risk and return. Explores leverage and capital structure and international managerial finance in the examination of the overall financial policy decision-making process.

EMGT 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EMGT 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

EMGT 6965. Co-op Work Experience Abroad. 0 Hours.
Provides eligible students with an opportunity for work experience abroad. May be repeated without limit.

EMGT 7374. Special Topics in Engineering Management. 4 Hours.
Offers topics of interest to the staff member conducting this class for advanced study. May be repeated without limit.

EMGT 7945. Master’s Project. 4 Hours.
Offers theoretical or experimental work under individual faculty supervision.

EMGT 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

EMGT 7978. Independent Study. 1-4 Hours.
Offers theoretical or experimental work under individual faculty supervision. May be repeated without limit.

EMGT 7990. Thesis. 1-8 Hours.
Offers analytical and/or experimental work conducted under the direction of the faculty in fulfillment of the requirements for the degree. Requires first-year students to attend a graduate seminar program that introduces the students to the methods of choosing a research topic, conducting research, and preparing a thesis. Requires successful completion of the seminar program. May be repeated without limit.

EMGT 7994. Thesis Continuation—Part Time. 0 Hours.
Continues thesis work conducted under the supervision of a departmental faculty member. May be repeated without limit.

EMGT 7996. Thesis Continuation. 0 Hours.
Continues thesis work conducted under the supervision of a departmental faculty member.

ENGL 1000. English at Northeastern. 1 Hour.
Intended for first-year students in the College of Social Sciences and Humanities. Introduces first-year students to the liberal arts in general; familiarizes them with their major; helps them develop the academic skills necessary to succeed (analytical ability and critical thinking); provides grounding in the culture and values of the University community; and helps them develop interpersonal skills—in short, familiarizes students with all skills needed to become a successful university student.

ENGL 1120. Trouble in Utopia. 4 Hours.
Offers a first-year seminar exploring utopian/dystopian thought from Plato to contemporary popular culture, as a site for literary, political, social, and personal experimentation. Offers students opportunities to identify, critique, and theorize utopian ideas in critical and creative writing exercises. Culminates in a collective exhibit for which students produce and analyze their own utopian “artifacts” in the medium of their choice.

ENGL 1130. Animals, Objects, Humans. 4 Hours.
Offers a first-year seminar examining the emotional, aesthetic, and ethical relationships that humans make with animals and objects. Offers students opportunities to engage critically and creatively with the variety of ways that we live those relationships and represent them in literature, art, film, and photography across cultures and through history.

ENGL 1140. Grammar: The Architecture of English. 4 Hours.
Seeks to provide students with the basic tools for analyzing sentence structure—the nuts and bolts of English. Starting from internalized systems of linguistic rules, which allow us to produce and understand language, students study the organizing principles of grammar: how words are assigned to categories (or parts of speech); how they form syntactic units, or phrases; and how these phrases function together in larger units, or clauses. Offers students an opportunity to acquire a precise vocabulary for talking about sentence structure, as well as a useful set of tools for analyzing language in all of its representations.

ENGL 1160. Introduction to Rhetoric. 4 Hours.
Introduces students to major concepts, traditions, and issues in rhetorical studies. Explores the range of ways that people persuade others to change their minds or take action; the relationship among language, truth, and knowledge; and the role of language in shaping identity and culture. Focuses on recognized thinkers from the Western tradition as well as writers that challenge the rhetorical canon. Emphasizes contemporary and interdisciplinary approaches to rhetoric interested in the entire range of rhetorical artifacts, with primary attention given to methods of critically investigating texts and their effects.
ENGL 1400. Introduction to Literary Studies. 4 Hours.
Offers a foundational course designed for English majors. Introduces the methods and topics of English literary and textual studies, including allied media (e.g., film, graphic narrative). Explores strategies for reading, interpreting, and theorizing about texts; for conducting research; for developing skills in thinking analytically and writing clearly about complex ideas; and for entering into written dialogue with scholarship in the diverse fields that comprise literary studies.

ENGL 1410. Introduction to Writing Studies. 4 Hours.
Introduces the basic theories, history, methodologies, and debates surrounding the study of how people learn to write and how writing is used in home, school, work, and civic contexts. Considers writing itself as both a practice and an object of study. Explores historical, rhetorical, linguistic, cognitive, social, and critical approaches to the teaching, study, and practice of writing, both in the U.S. tradition and in international contexts (e.g., UK, France, China). Emphasizes research on the development of critical reading and writing practices and students' understanding of their own experiences and practices of other groups.

ENGL 1450. Reading and Writing in the Digital Age. 4 Hours.
Grapples with the long and sometimes tumultuous relationship between literature—including fiction, poetry, film, and video games—and new media technologies. Offers students opportunities to historicize and engage the social and literary upheavals of our own technological moment through reading, discussion, writing projects, and practicums that seek to develop skills for analyzing the data and metadata of texts through both qualitative and quantitative methods.

ENGL 1500. British Literature to 1800. 4 Hours.
Surveys the major British writers and major literary works from the Middle Ages to the end of the eighteenth century. Includes works by such writers as Julian of Norwich, Chaucer, Spenser, Shakespeare, Milton, Behn, Pope, and Swift.

ENGL 1501. British Literature 1800 to Present. 4 Hours.
Surveys the major British and British postcolonial writers and major literary movements from the Romantic period through the Victorian and modern periods to the present. Includes works by such writers as Wordsworth, Hemens, Browning, Tennyson, Yeats, Lawrence, Lessing, Beckett, and Achebe.

ENGL 1502. American Literature to 1865. 4 Hours.
Surveys the major American writers and major literary forms from the colonial period to the Civil War. Includes works by such writers as Bradstreet, Taylor, Wheatley, Cooper, Poe, Hawthorne, Douglass, Stowe, Melville, and Emerson.

ENGL 1503. American Literature 1865 to Present. 4 Hours.
Surveys the major American writers and major literary works from the Civil War through the present. Includes works by such writers as Whitman, Dickinson, Twain, James, Hemingway, Moore, Faulkner, Ellison, and Morrison.

ENGL 1600. Introduction to Shakespeare. 4 Hours.
Introduces students to a selection of Shakespeare's major plays in each of the principle genres of comedy, tragedy, history, and romance.

ENGL 1700. Global Literature to 1500. 4 Hours.
Introduces students to the ancient and classical literatures of Greece, Rome, and the eastern Mediterranean, as well as other premodern literatures in translation.

ENGL 1701. Global Literature 1500 to Present. 4 Hours.
Focuses on the literatures (in English or in translation) of the world from the early modern period to the present.

ENGL 1700. Global Literature to 1500. 4 Hours.
Introduces students to the field of narrative medicine, which explores literary analysis as a set of tools for medical practice. Offers students an opportunity to develop close reading and analytical skills that are useful for improving doctor-patient relationships and patient care. Requires students to complete essays that cultivate these skills.

ENGL 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENGL 1995. Practicum. 1-4 Hours.
Offers eligible students an opportunity for practical experience. May be repeated without limit.

ENGL 2150. Literature and Digital Diversity. 4 Hours.
Focuses on the use of digital methods to analyze and archive literary texts, emphasizing issues of diversity and inclusion. Covers three main areas: text encoding, textual analysis, and archive construction. Considers literary texts and corpora, including works by well-known authors such as Shakespeare, together with collections by marginalized writers, including slave narratives and writings by early modern women. Offers students an opportunity to explore what counts as literature and how computers, databases, and analytical tools give substance to concepts of aesthetic, cultural, and intellectual value as inflected by race and gender.

ENGL 2200. The Bible. 4 Hours.
Studies books of both the Old Testament and the New Testament as literature and as history.

ENGL 2210. Medieval British Literature. 4 Hours.
Surveys the major works of medieval English literature. Includes such works as Sir Gawain, Piers Plowman, and Pearl.

ENGL 2215. Shakespeare's Comedies. 4 Hours.
Explores such central themes as marriage, sexuality, and festive inversions of power in Shakespeare's comedies and romances. Gives attention to historical, cultural, and theoretical frameworks for the study of comedy.

ENGL 2216. Shakespeare's Tragedies. 4 Hours.
Studies the nature of the tragic hero, the questioning of social norms, and the landscape of chaos in plays ranging from Julius Caesar to Coriolanus.

ENGL 2230. 16th-Century British Literature. 4 Hours.
Focuses on the literature and culture of the English Renaissance, including such genres as sonnet sequence, romance, drama, bloodstream ballads, and ghost stories. Authors may include Wyatt, Sidney, Spenser, Elizabeth I, Shakespeare, and Marlowe, as well as lesser known and anonymous authors.

ENGL 2240. 17th-Century British Literature. 4 Hours.
Examines the literature and culture of the period from the death of Elizabeth I to the end of the century. Considers such figures as Bacon, Jonson, Donne, Herbert, Milton, Marvell, Cavendish, and Behn.

ENGL 2250. 18th-Century British Literature. 4 Hours.
Surveys the long eighteenth century with particular attention to the Augustan age. Includes such major writers as Behn, Pope, Swift, Goldsmith, and Johnson.

ENGL 2260. Romantic Poetry. 4 Hours.
Surveys the development of English Romantic poetry, in both its lyric and longer forms, in Blake, Wordsworth, Coleridge, Byron, Shelley, and Keats, as well as Dorothy Wordsworth, Mary Shelley, and Felicia Hemans. Emphasizes problems of belief and the relationship of the individual to the surrounding world of natural, social, and historical process.
ENGL 2270. Victorian Literature. 4 Hours.
Surveys the major writers, genres, and issues of Victorian England, considering such authors as Tennyson, Browning, Dickens, the Brontës, Hopkins, and Wilde.

ENGL 2280. 19th-Century British Fiction. 4 Hours.
Studies theme and form in the major English novels of the nineteenth century, considering such authors as the Brontës, Charles Dickens, George Eliot, and Thomas Hardy.

ENGL 2290. 20th-Century British Literature. 4 Hours.
Surveys the work of twentieth-century English authors in both poetry and prose, including such writers as William Butler Yeats, D. H. Lawrence, W. H. Auden, Doris Lessing, and Iris Murdoch.

ENGL 2291. Major 20th-Century British Novelists. 4 Hours.
Introduces students to British fiction from Joseph Conrad to John Fowles, including such writers as D. H. Lawrence and Virginia Woolf. Attention given to novelistic form and historical context.

ENGL 2295. Revolution and Revolt in Early American Literature. 4 Hours.
Examines American literature in the context of the colonial Atlantic world and the early Republic, including such writers as Bradford, Bradfordstreet, Taylor, Edwards, Franklin, Wheatley, Irving, and Bryant.

ENGL 2296. Early African-American Literature. 4 Hours.
Surveys the development and range of black American writers and writers of the black Atlantic, focusing on poetry and prose from the Middle Passage to the Civil War.

ENGL 2301. The Graphic Novel. 4 Hours.
Explores the word-and-image relationship in a narrative form. Offers students an opportunity to learn how to read comics—and what they teach us about reading—in addition to the creative practices that go into making them. Examines antecedents including "engraved novels," newspaper comic strips, "wordless novels," underground comic books, and punk fanzines to understand the graphic novel's rise in the 1970s. Explores current directions in production. Includes visits from artists to discuss the craft of this verbal-visual form. ARTE 2301 and ENGL 2301 are cross-listed.

ENGL 2320. 19th-Century American Novels. 4 Hours.
Focuses on the themes, forms, and techniques of major American novelists of the nineteenth and early twentieth centuries, such as Cooper, Hawthorne, Melville, Stowe, Twain, and James.

ENGL 2321. 20th- and 21st-Century American Novels. 4 Hours.
Studies the modern and contemporary American novel, considering such writers as Cather, Fitzgerald, Hemingway, Hurston, Faulkner, Bellow, Baldwin, and Morrison.

ENGL 2330. The American Renaissance. 4 Hours.
Studies the nineteenth-century development of an American national literary tradition in the context of democratic and romantic attitudes toward experience, nation formation, and national crisis. Includes such writers as Emerson, Thoreau, Hawthorne, Fuller, and Melville.

ENGL 2340. American Realism. 4 Hours.
Examines the realist tradition in American literature, including local color and native humor, from the end of the Civil War to the beginning of the twentieth century. Includes such writers as Twain, James, Harding Davis, Howells, Crane, Chesnutt, and Norris.

ENGL 2355. Modern American Literature. 4 Hours.
Studies major developments in American poetry and fiction from 1900 to 1945. Considers such poets as Frost, Eliot, Stevens, Williams, and Moore and such novelists as Hemingway, Faulkner, Fitzgerald, and Cather.

ENGL 2360. Modern African-American Literature. 4 Hours.
Surveys the development and range of black American writers in poetry and prose from the post-Civil War period to the present.

ENGL 2370. The Modern Short Story. 4 Hours.
Studies the short story from Henry to the present, including such writers as Joyce, Kafka, Munro, and O'Connor.

ENGL 2380. The Modern Novel. 4 Hours.
Studies the major British and American novelists of the twentieth century. Considers theme and form in such authors as Lawrence, Woolf, Fitzgerald, Ellison, and Hurston.

ENGL 2400. Modern Poetry. 4 Hours.
Studies the modernist tradition in American and British poetry. Considers such writers as Moore, Yeats, Hardy, Frost, Eliot, Stevens, Williams, and Cummings.

ENGL 2410. Contemporary American Literature. 4 Hours.
Studies major movements in American poetry and fiction since 1945. Considers such poets as Plath, Ashbery, and Dove and such novelists as Morrison, Pynchon, and DeLillo.

ENGL 2420. Contemporary Poetry. 4 Hours.
Studies developments in British and (especially) American poetry since 1945. Includes such writers as Bishop, Lowell, Ginsberg, Ashbery, Walcott, Heaney, Kunitz, Jorie Graham, Frank Bidart, Rita Dove, and Kevin Young.

ENGL 2430. Contemporary Fiction. 4 Hours.
Examines British and American writers from 1945 to the present, including such figures as Lessing, Burgess, Pynchon, Morrison, Kingston, and Erdrich.

ENGL 2440. The Modern Bestseller. 4 Hours.
Explores the relationship between commercially successful fiction and the popular imagination.

ENGL 2450. Postcolonial Literature. 4 Hours.
Examines the literature and cultures of postcolonial nations in the Caribbean, Africa, and Asia. Designed to familiarize students with the cultural paradigms and transnational experiences of colonialism. Focuses on the variety of artistic strategies employed by writers to communicate contemporary postcolonial themes such as neocolonialism, nationalism, Third-World feminism, and diaspora.

ENGL 2451. Postcolonial Women Writers. 4 Hours.
Examines the literature and cultures of postcolonial nations in the Caribbean, Africa, Asia, and elsewhere through the lens of gender. Designed to familiarize students with the relationships between cultural paradigms associated with gender and transnational experiences of colonialism. Focuses on the variety of artistic strategies employed by writers to communicate the impacts of gender and sexuality on contemporary postcolonial themes such as neocolonialism, nationalism, and diaspora. Writers may include Chimamanda Adichie, Nawal El-Saadawi, Marjane Satrapi, Bessie Head, Arundhati Roy, Banana Yoshimoto, Sonia Singh, and Dionne Brand.

ENGL 2455. American Women Writers. 4 Hours.
Surveys the diversity of American women's writing to ask what it means to describe writers as disparate as Phillis Wheatley, Edith Wharton, Toni Morrison, and Alison Bechdel as part of the same "tradition." With attention to all genres of American women's writing, introduces issues of genre and gender; literary identification; canons; the politics of recuperation; silence and masquerade; gender and sexuality; intersectionality; sexual and literary politics, compulsory heterosexuality, and more. AFAM 2455, ENGL 2455, and WMNS 2455 are cross-listed.
ENGL 2460. Multiethnic Literatures of the U.S.. 4 Hours.
Explores contemporary American literature by writers from distinctive ethnic groups (for example, Native, Asian, African, Latino/a, Jewish, Italian, Irish, Arab). Features a variety of works that reflect an evolving recognition of the artistically and culturally diverse nature of American literature.

ENGL 2470. Asian-American Literature. 4 Hours.
Introduces students to American writers of Chinese, Japanese, Korean, Filipino, South Asian, and Southeast Asian descent. Focuses on works published since the 1960s. Pays close attention to prevalent themes, sociohistorical contexts, and literary form.

ENGL 2480. U.S. Latino/a Literature. 4 Hours.
Introduces students to American authors from various Spanish-speaking origins (for example, Mexican, Cuban, Dominican, and Puerto Rican). Explores the use of both traditional and experimental forms and themes such as gender roles, bilingualism, and cultural identity. Examines works written in English and published since the 1960s.

ENGL 2490. Native American Literature. 4 Hours.
Introduces students to Native American authors and critics. Emphasizes works published since the Native American renaissance of the late 1960s. Addresses ongoing critical debates such as the connection between Native traditions and contemporary Native American literature.

ENGL 2510. Horror Fiction. 4 Hours.
Explores English and American horror fiction. Focuses on short stories, novels, and movies. Examines the evolution of horror fiction and the various themes, techniques, and uses of the macabre.

ENGL 2520. Science Fiction. 4 Hours.
Traces the development of various science fiction themes, conventions, and approaches from early human-vs.-machine tales to tales of alien encounters. Examines how science fiction explores the relationship between humans and technology as well as humans and nature.

ENGL 2600. Irish Literary Culture Abroad. 4 Hours.
Explores Irish writers from the nineteenth century through the present. Emphasizes their relationships to contemporary Irish society. Explores the formal traditions of Irish writing as well as the historical, political, and cultural discourses that Irish writing has both helped to shape and within which the writing circulates. As the course takes place in Dublin during the summer term, offers students an opportunity to meet living Irish writers who talk about their relationship to the literary tradition and their own craft. Covers writers such as Oscar Wilde, James Joyce, Kate O’Brien, Colm Tóibín, Anne Enright, Paul Murray, Kevin Barry, and Maeve Binchy.

ENGL 2610. Contemporary Israeli Literature and Art Abroad. 4 Hours.
Explores contemporary Israeli culture through literature and art. Focuses on the tensions, pains, and pleasures of existence from various Israeli points of view. Takes place in Israel during the summer term, offering students an opportunity to meet with contemporary Israeli writers, visit sites of the literary settings, and explore art galleries and museums. Readings include short stories and poetry by major Israeli and Palestinian writers from 1948 through the present. ENGL 2610 and JWSS 2610 are cross-listed.

Focuses on a variety of texts (imaginative literature, memoir, scientific writing, creative nonfiction, and popular journalism) that take nature, ecology, and the environment as their subject. Examines paintings, photography, and other visual representations (such as computer simulations) of the natural world. Takes place in Boston and in the United Kingdom.

ENGL 2690. Boston in Literature. 4 Hours.
Explores the various ways in which the city of Boston and its environs are represented in literature and other media. Each semester, the course focuses on a different aspect of Boston in literature, such as representations of Boston's different communities, different historical eras, particular genres or concepts associated with the city, and so forth. Offers students an opportunity to build upon their readings about the city by experiencing independent site visits, class field trips, guest speakers, and other activities. In addition to a culminating group or individual research project about Boston, students may also have the opportunity to participate in a community-based reading project.

ENGL 2700. Creative Writing. 4 Hours.
Gives the developing writer an opportunity to practice writing various forms of both poetry and prose. Features in-class discussion of student work.

ENGL 2710. Style and Editing. 4 Hours.
Explores the relationship between style and substance through close attention to choices made at the level of the paragraph, sentence, and word. Introduces editorial processes and practices and gives students practice in editing for themselves and others.

ENGL 2730. Digital Writing. 4 Hours.
Explores the ways in which composing processes and meaning are impacted when writing moves from material media (e.g., print, images, voice, and performance) to digital media (e.g., hypertexts, digital stories, and videos). Readings cover aspects of digital writing as semiotic (e.g., domains of meaning, mode, materiality, delivery, ensembles of meaning) and draw on theories of multimodality to explore digital remediations of writing. Culminates in an electronic portfolio and collective exhibit.

ENGL 2740. Writing and Community Engagement. 4 Hours.
Offers students an opportunity to study and practice writing in community contexts through advocacy writing, service-learning, community research, and/or community publishing.

ENGL 2760. Writing in Global Contexts. 4 Hours.
Explores the various ways that linguistic diversity shapes our everyday, academic, and professional lives. Offers students an opportunity to learn about language policy, the changing place of World English in globalization, and what contemporary theories of linguistic diversity, such as translanguaging, mean for writing. Invites students to explore their own multilingual communities or histories through empirical or archival research.

ENGL 2770. Writing to Heal. 4 Hours.
Explores how creative writing can be used as a healing tool. Offers students opportunities to analyze, theorize, and create healing narratives through readings, in-class writing activities, writing workshops, and process journals. Culminates in the creation and revision of written personal narratives as well as a digital storytelling project.

ENGL 2780. Visual Writing: Writing Visuals. 4 Hours.
Explores how visual elements, such as fonts, graphics, charts, and video, work within different types of documents to reach various audiences across cultures. Readings cover several aspects of visual writing (e.g., thinking, learning, and expressing) and draw on theories of visual rhetoric to explore the interaction among content, visual elements, audiences, and contexts. Culminates in an electronic portfolio and collective exhibit.

ENGL 2830. Literary Theory. 4 Hours.
Introduces students to major twentieth-century theoretical approaches to literature in conjunction with the close reading of literary works in several genres.
ENGL 2850. Writing for Social Media: Theory and Practice. 4 Hours.
Explores the development and roles of social media writing. Asks students to describe, define, and contextualize current social media genre(s) using readings from social media sites, scholarship, popular/journalistic works, and fiction. Invites students to adopt a new social media platform and to produce social media writing in short, longer individually produced, and longer collaborative forms. Offers each student an opportunity to create a curated, reflective portfolio that works toward an integrated personal/professional digital identity.

ENGL 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENGL 2991. Research Practicum. 2-4 Hours.
Involves students in collaborative research under the supervision of a faculty member. Offers students an opportunity to learn basic research methods in the discipline. Requires permission of instructor for freshmen. May be repeated once for up to 4 total credits.

ENGL 2995. Practicum. 1-4 Hours.
Offers eligible students an opportunity for practical experience. May be repeated without limit.

ENGL 3151. Topics in Early Literatures Abroad. 4 Hours.
Focuses on a particular aspect of medieval or Renaissance British literature, such as medieval romance or Renaissance representations of gender and sexuality. Designated for students engaged in study abroad through the Dialogue of Civilizations program.

ENGL 3325. Rhetoric of Law. 4 Hours.
Introduces students to the persuasive work of legal texts, procedures, and institutions. Investigates the range of critical approaches to the study of law and rhetoric, as well as the implications of understanding law as rhetorical. Draws on texts produced by lawyers and judges, classical rhetoricians, contemporary rhetorical critics, and legal scholars.

ENGL 3340. Technologies of Text. 4 Hours.
Examines innovations that have reshaped how humans share information, e.g., the alphabet, the book, the printing press, the postal system, the computer. Focuses on debates over privacy, memory, intellectual property, and textual authority that have historically accompanied the rise of new media forms and genres. Offers students an opportunity to gain skills for working with texts using the rapidly changing tools of the present, e.g., geographic information systems, data mining, textual analysis.

ENGL 3370. Writing Cultures. 4 Hours.
Offers students an opportunity to conduct qualitative empirical research (using methods such as interviewing and observation) into rhetorical practices, such as reading, writing, listening, speaking, and body language. Explores the role of rhetoric in the representation of people, cultures, and research in online and physical spaces.

ENGL 3375. Writing Boston. 4 Hours.
Explores how writing shapes the life of, and life in, the city. Considers how Boston is constructed in a range of discourses and disciplines. Offers students an opportunity to research and write about the city and participate in a community-based writing project.

ENGL 3376. Creative Nonfiction. 4 Hours.
Explores how writers apply narrative strategies and techniques to factual material. Offers students an opportunity to read and write a variety of nonfiction forms (e.g., narrative essays and narrative journalism, travel and science writing, memoir, editorials, protest and political essays), as well as cross-genre and hybrid forms (e.g., nonfiction prose mixed with poetry, audio and graphic nonfiction). The topics for narrative nonfiction writing apply to a wide array of disciplines, including the humanities, the sciences, and journalism.

ENGL 3377. Poetry Workshop. 4 Hours.
Offers an advanced workshop in writing and reading original poetry. Students experiment in established poetic forms. Features in-class discussion of student work.

ENGL 3378. Fiction Workshop. 4 Hours.
Offers an advanced workshop in writing and reading original fiction. Features in-class discussion of student work.

ENGL 3379. Nonfiction Workshop. 4 Hours.
Offers an advanced workshop in writing and reading original nonfiction. Features in-class discussion of student work.

ENGL 3380. Topics in Writing. 4 Hours.
Allows writers to hone their skills as readers and writers and to develop their interests in a particular form, such as travel writing, autobiography, and science writing. May be repeated without limit.

ENGL 3381. The Practice and Theory of Teaching Writing. 4 Hours.
Focuses on the teaching of writing by studying the professional literature of writing theory as well as a teaching practicum. Students work as a writing tutor or shadow experienced teachers. Offers students an opportunity to prepare for future teaching of writing and to obtain deeper insight into their own writing processes.

ENGL 3382. Publishing in the 21st Century. 4 Hours.
Explores modes and processes of publication in an era of technological and economic change. Investigates the roles of writers, editors, and publishers in this shifting landscape. Offers students an opportunity to attend readings, lectures, and other community literacy events and work with community partners on publication projects.

ENGL 3383. The Writer’s Marketplace. 4 Hours.
Explores how writers negotiate the world of literary publishing. Focuses on producing publishable work in genres of the student’s choice (fiction, poetry, creative nonfiction), submitting work to appropriate venues, and working with editors and agents.

ENGL 3384. Literature and Politics. 4 Hours.
Explores how authors represent the religious, moral, ethical, and social conflicts arising from the acquisition, use, and misuse of political power.

ENGL 3387. The Literature of Science. 4 Hours.
Examines historical instances of the discovery methods and models of literature and science, exploring one or more of the following areas: the relationship of the methods and models of literature and science; the treatment of scientific methods and models in literary texts; and the use of assumed cultural contexts, and literary devices, techniques, and traditions in scientific texts. Readings are drawn from the areas of social history of science, science, and literature.

ENGL 3388. Film and Text Abroad. 4 Hours.
Studies the similarities and differences between literary texts and film versions of those texts or the interrelations between film and literature as a means of cultural expression in a specific country outside the United States. May be repeated without limit.

ENGL 3389. Film and Text. 4 Hours.
Studies either the similarities and differences between literary texts and film versions of those texts or the interrelations between film and literature as means of cultural expression during a specific historical period. For example, students might compare Doctorow’s Book of Daniel to the film version, Daniel, or they might study books and movies of a period like the sixties that reflect the spirit of the era (Catch-22, The Graduate).

ENGL 3572. Fantasy. 4 Hours.
Explores the social, psychological, and social contexts of fantasy in the work of writers such as Carroll, Poe, Kafka, Le Guin, and Tolkien.
ENGL 3582. Children's Literature. 4 Hours.
Studies children's literature with attention to such matters as genre, theme, and social dynamics.

ENGL 3589. Psychology and Literature. 4 Hours.
Concentrates on twentieth-century novels and short stories that stress individual behavior and motivation and reveal human mental and emotional processes. Includes such writers as Kafka, Woolf, Faulkner, Conrad, and Lawrence.

ENGL 3605. Medieval Romance and Modern Readers. 4 Hours.
Focuses on a variety of medieval romances in their original historical and cultural contexts. Includes the study of adaptations and retellings of medieval romances in modern literature, film, and art.

ENGL 3607. Chaucer. 4 Hours.
Surveys the work of Chaucer, with emphasis on the Canterbury Tales.

ENGL 3618. Milton. 4 Hours.
Concentrates on Milton's Paradise Lost, with supplementary readings in his minor poetry and prose.

ENGL 3619. Emerson and Thoreau. 4 Hours.
Focuses on Ralph Waldo Emerson and Henry David Thoreau, two major American Romantic writers whose ideas about the individual, spirituality, nature, and politics have had a wide-ranging impact on American culture. Readings include essays, poetry, and journals by these two Massachusetts-based authors.

ENGL 3663. The African-American Novel. 4 Hours.
Studies the African-American novelist's place in the history of American fiction. Focuses on Chesnutt, Toomer, Wright, Ellison, and contemporary novelists and on their different perceptions of the African-American experience in America.

ENGL 3676. Representing Gender and Sexuality in Literature. 4 Hours.
Investigates the construction of gender and its representation in relation to sexuality, power, and subjectivity in a variety of texts. May be repeated without limit. ENGL 3676 and WMNS 3676 are cross-listed.

ENGL 3678. Bedrooms and Battlefields: Hebrew Bible and the Origins of Sex, Gender, and Ethnicity. 4 Hours.
Considers stories from Hebrew Scripture in English translation, beginning with the Garden of Eden through the Book of Ruth, asking how these foundational narratives establish the categories that have come to define our humanity. Analyzes how the Bible's patterns of representation construct sexual and ethnic identities and naturalize ideas about such social institutions as "the family." ENGL 3678, JWSS 3678, and WMNS 3678 are cross-listed.

ENGL 3685. From Kafka to Kushner: Modern and Contemporary Jewish Literature. 4 Hours.
Surveys Jewish literature from the late modern (1880–1948) and contemporary (1948–present) periods. Considers themes of immigration and cross-cultural influences and issues of religious, ethnic, and gender identity. Emphasizes American and European literatures to begin to define an international Jewish literary canon, including Yiddish poets and playwrights, Russian Jewish writers, and modern writers. ENGL 3685 and JWSS 3685 are cross-listed.

ENGL 3690. The City in Literature. 4 Hours.
Examines the urban experience as it has been depicted in selected literary texts. Discusses such themes as the city as a place of possibility, the city as a center of art and an influence on creative form in an interdisciplinary fashion.

ENGL 3720. 19th-Century Major Figure. 4 Hours.
Examines in detail the work and critical reception of a major writer of the nineteenth century. May be repeated up to four times.

ENGL 3730. 20th- and 21st-Century Major Figure. 4 Hours.
Examines in detail the work and critical reception of a major writer of the twentieth or twenty-first century. May be repeated up to four times.

ENGL 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENGL 3995. Practicum. 1-4 Hours.
Offers eligible students an opportunity for practical experience. May be repeated without limit.

ENGL 4000. Topics in Early Literatures. 4 Hours.
Focuses on a particular aspect of medieval or Renaissance British literature, such as medieval romance or Renaissance representations of gender and sexuality. May be repeated up to five times.

ENGL 4010. Topics in Shakespeare. 4 Hours.
Examines a focused topic, theme, or critical approach to Shakespeare. May be repeated without limit.

ENGL 4020. Topics in 17th- and 18th-Century Literatures. 4 Hours.
Focuses on a particular topic in 17th- or 18th-century British or American literature, such as women and the novel or the captivity narrative. May be repeated once.

ENGL 4040. Topics in 19th-Century Literatures. 4 Hours.
Focuses on a particular topic in 19th-century British or American literature, such as lyric poetry or popular print culture. May be repeated once.

ENGL 4060. Topics in 20th- and 21st-Century Literatures. 4 Hours.
Focuses on a particular topic in 20th- or 21st-century British or American literature, such as capitalism or the Harlem Renaissance. May be repeated once.

ENGL 4070. Topics in Genre. 4 Hours.
Explores the characteristics of a particular literary form over time through works by various authors. May be repeated without limit.

ENGL 4080. Topics in Film. 4 Hours.
Studies a theme or problem (film and society, film and politics), a period in film history (American film from 1945 to the present), a film genre (the western, film noir), or a film director (Hitchcock, Coppola). May be repeated without limit.

ENGL 4100. Topics in Literary Criticism. 4 Hours.
Studies a specific problem, method, or school of literary criticism, such as poststructuralism or feminist criticism. May be repeated without limit.

ENGL 4110. Topics in Rhetoric and Writing Studies. 4 Hours.
Focuses on a particular topic in rhetoric and writing studies, such as rhetorical education, technologies of literacy, or writing and identity. May be repeated once.

ENGL 4400. Opening the Archive. 4 Hours.
Offers a seminar designed to introduce students to the rich archival holdings in the greater Boston area and to offer training in the materials and methods of primary source research. Primary materials include a wide range of resources, including books, manuscripts, letters, pamphlets, broadsides, journals, maps, illustrations, photographs, etc., from the seventeenth through the twentieth centuries.

ENGL 4410. Research in Rhetoric and Writing. 4 Hours.
Introduces students to, and offers them practice in, a range of research methodologies (e.g., ethnography, archival research, historical inquiry) and methods (e.g., interviewing, observation, rhetorical analysis) for studying rhetoric, writing, and writers. Requires permission of instructor for freshmen and sophomores.
ENGL 4684. Topics in Postcolonial Literature. 4 Hours.
Focuses on a nation (e.g., the African/Nigerian novel, Indo-Anglian writing, Jamaican dub poetry), theme (e.g., women writers, cosmopolitanism, narrating the nation), or genre (e.g., magical realism, political drama, translation) in postcolonial literature. May be repeated without limit.

ENGL 4688. Topics in Comparative Textual Studies. 4 Hours.
Explores topics that cross national boundaries or historical periods, such as print culture in the transatlantic world, black women writers, and visual rhetoric. May be repeated up to four times.

ENGL 4710. Capstone Seminar. 4 Hours.
Offers an advanced senior seminar organized around an important critical question in the discipline. This writing-intensive course is designed to be a summative experience for English majors, offering in-depth study of the theories, methods, and practices of critical work on a particular topic while providing students opportunities for reflecting on the connections between their capstone and other work they have done as majors. Offers students an opportunity to produce significant research projects on the critical issues raised by the seminar. May be repeated without limit.

ENGL 4720. Capstone Project. 4 Hours.
Offers students an opportunity to design, develop, and complete a major intellectual project in a workshop setting. Students must enter this course with an approved project and the support of a faculty member in the relevant area of study. In addition to producing original research, offers students an opportunity to contextualize their work in relation to their focus within English studies, their experience of the major, and their intellectual and professional goals.

ENGL 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

ENGL 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ENGL 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENGL 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

ENGL 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ENGL 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ENGL 4994. Internship. 4 Hours.
Offers students internships under the direction of a faculty member in such areas as publishing, education, or business and technical writing. Requires students to produce both a portfolio of professional work and a final paper reflecting on their internship experience. May be repeated without limit.

ENGL 4995. Practicum. 1-4 Hours.
Offers eligible students an opportunity for practical experience. May be repeated without limit.

ENGL 4996. Experiential Education Directed Study. 4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using the course to fulfill their experiential education requirement. May be repeated without limit.

ENGL 4997. Senior Thesis. 4 Hours.
Offers students an opportunity to prepare an undergraduate thesis under faculty supervision.

ENGL 5101. Critical Issues. 3 Hours.
Introduces the terms and discourses of literary theory as it is currently practiced and debated, and provides the historical context for such practices and debates.

ENGL 5102. Key Concepts in Rhetoric and Composition. 3 Hours.
Serves as an introduction to the fields of rhetoric and composition. Provides a foundational vocabulary for understanding the concerns of these fields by considering the history and current meanings of terms crucial to both, for example, “knowledge,” “authority,” “discourse,” “text,” “context,” and “argument.”

ENGL 5103. Proseminar. 3 Hours.
Introduces the history and current scholarly practices of English studies. Surveys theoretical, methodological, and institutional issues in the development of the discipline; introduces students to the research of the English department’s graduate faculty; and offers opportunities for the practice of key components of scholarly production, including formulating research questions, using databases, conducting literature reviews, and writing and presenting scholarship in common formats other than the long research paper, such as conference proposals, oral presentations, and book reviews.

ENGL 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ENGL 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ENGL 5984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

ENGL 6960. Exam Preparation—Master’s. 0 Hours.
Offers the student the opportunity to prepare for the master’s qualifying exam under faculty supervision.

ENGL 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENGL 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

ENGL 7000. Qualifying Exam. 0 Hours.
Provides eligible students with an opportunity to take the master’s qualifying exam.

ENGL 7111. Rhetorical Theory. 3 Hours.
Introduces major concepts, figures, and issues in rhetoric from the classical period to the present day. Explores theories about the scope of rhetoric, the nature of persuasion, and the relationship between language and knowledge.
ENGL 7112. Rhetorical Criticism. 3 Hours.
Trains students to analyze critically the rhetorical work of written and spoken texts, as well as other artifacts, discourses, and practices. Emphasizes prominent methods of rhetorical criticism, drawing on neo-Aristotelianism, genre theory, feminist studies, dramatism, and cultural studies. Introduces students to current debates in the field as well as to perennial issues, such as the purposes of criticism, the relationship between theory and practice, the interaction of text and context, and the role of the critic.

ENGL 7121. Composition Studies. 3 Hours.
Focuses on theories about writing, reading, and learning, and how these theories are played out in practice in often competing and contradictory ways. Examines and critiques the four paradigms that dominate composition theory and practice today: the classical model, the expressivist model, the cognitivist model, and the social-constructivist model.

ENGL 7123. Approaches to Teaching Writing. 3 Hours.
Considers several currently influential approaches to the teaching of writing in schools and colleges, with attention to differences not only in the practices they entail but in the theories and research that inform them.

ENGL 7201. Perspectives on American Literature. 3 Hours.
Attempts to discover or disrupt common themes and recurrent patterns in American literature through a close reading or a critique of primary texts.

ENGL 7202. African-American Literature. 3 Hours.
Focuses on the development of the traditions, critical paradigms, recurrent themes, and patterns of African-American literature through close readings of selected texts and critics. Considers such writers as Houston Baker, Jr., Henry Louis Gates, Jr., Frederick Douglass, Harriet Jacobs, William S. Braithwaite, Larry Neal, Ralph Ellison, Barbara Christian, Richard Wright, Ishmael Reed, Bell Hooks, and Audre Lorde.

ENGL 7206. American Literature and Culture 1. 3 Hours.
Examines early American cultural patterns as they emerge from a wide variety of texts including accounts of exploration and settlement; diaries; poetry; Native American oratory and sacred texts; slave, captivity, and witchcraft narratives; political tracts; novels; and letters. Emphasis is on how issues of colonialism, cross-cultural contact, race relations, and the rise of political and national consciousness affected literary art and rhetorical expression from 1492 to 1800.

ENGL 7207. American Literature and Culture 2. 3 Hours.
Focuses on American writing from 1800 to 1900, emphasizing the ways in which literary texts reflected, enacted, questioned, and controverted cultural assumptions and constructions in the period. Topics include nationalism and territorial expansion; libertarian ideology and such practices as slavery, limited citizenship, and restricted franchise; immigration and “nativism”; and industrialization and pastoralism.

ENGL 7211. Topics in American Literature. 3 Hours.
Explores a significant topic in American literature; for example, realism, humor, the frontier, southern writing, or ethnic American literature (Asian American, Native American, Latino/a and African American). May be repeated without limit.

ENGL 7212. Topics in African-American Literature. 3 Hours.
Explores a topic, theme, or genre in depth in African-American literature, such as slave narratives, women writers, the Harlem Renaissance, autobiography, or contemporary writers. May be repeated without limit.

ENGL 7213. Topics in Early American Literature. 3 Hours.
Focuses on the work of one writer, a group of writers, or a theme or structure common to several writers-Jonathan Edwards, women writers, the poets of the seventeenth and eighteenth centuries, or typology, for example-in the first two hundred years of American literature. Topics change with time and demand. May be repeated without limit.

ENGL 7214. Topics in 19th-Century American Literature. 3 Hours.
Considers such literary and cultural topics as transcendentalism, the literature of the Civil War, slave narratives, women’s narratives, and the literature of social reform. May be repeated without limit.

ENGL 7215. Topics in 20th-Century American Literature. 3 Hours.
Examines an issue or issues in twentieth-century American literature, such as women in twentieth-century American writing; surrealism in modern and contemporary American poetry; naturalism and the city in the modern American novel; autobiography by American women writers of color; and race, ethnicity, and the oral tradition in ethnic American literature. May be repeated without limit.

ENGL 7221. Major American Novelist. 3 Hours.
Examines in detail the work of a major American novelist and its historical context and cultural milieu. May be repeated without limit.

ENGL 7222. Major American Playwright. 3 Hours.
Examines in detail the work of a major American playwright and its theatrical style and social impact-the work, for example, of Eugene O’Neill, Tennessee Williams, Lillian Hellman, Arthur Miller, Edward Albee, August Wilson, or Ntozake Shange. May be repeated without limit.

ENGL 7223. Major American Poet. 3 Hours.
Examines in detail the work of a single major American poet, placing it within its literary and cultural contexts. Some possible subjects are Whitman, Dickinson, Frost, Eliot, H.D., Williams, Hughes, Stevens, Lowell, Moore, Bishop, Merrill, and Ashbery. May be repeated without limit.

ENGL 7224. Major Figures in African-American Literature. 3 Hours.
Focuses on a major African-American novelist, poet, or dramatist, the existing criticism, and the author’s historical context and cultural milieu. Authors considered are Richard Wright, Toni Morrison, Langston Hughes, Zora Neale Hurston, Imamu Amiri Baraka, August Wilson, Lorraine Hansberry, Alice Walker, John Wideman, and Gloria Naylor. May be repeated without limit.

ENGL 7225. Individual American Writer. 3 Hours.
Offers topics to be announced. May be repeated without limit.

ENGL 7226. Individual Modern American Novelist. 3 Hours.
Examines in depth the work of a major figure in twentieth-century American fiction, focusing on the cultural context out of which he or she emerges. May be repeated without limit.

ENGL 7231. 19th-Century American Prose, 1820-1865. 3 Hours.
Focuses on the characteristics of the romantic movement and New England transcendentalism in the works of the principal prose writers of the period. Studies themes and techniques of such writers as Poe, Hawthorne, Melville, Emerson, Fuller, and Thoreau.

ENGL 7232. 19th-Century American Prose, 1865-1900. 3 Hours.
Covers the post–Civil War novel in America, including the realistic and naturalistic movements, and such authors as Twain, Howells, Henry James, Kate Chopin, and Edith Wharton. Includes some notable nonfiction writers, such as Henry Adams and William James.
ENGL 7233. 19th-Century American Poetry. 3 Hours.
Explores poetry written in the United States in the nineteenth century. Authors considered may include Dickinson and Whitman; New England poets including Whittier, Longfellow, Sigourney, and Holmes; and African-American poets, such as Frances Ellen Watkins Harper. Issues considered may include poetry and American literary nationalism; gender, sentimentality, and poetry; and abolition and the Civil War in poetry.

ENGL 7241. Modern American Prose. 3 Hours.
Includes close examination of such prose forms as the essay, short story, autobiography, biography, history, and so on. May select writers with some special purpose in view, but focuses on those generally representative of the 1912-1950 period.

ENGL 7243. Modern American Drama. 3 Hours.
Analyzes philosophic and aesthetic trends among such playwrights as O'Neill, Williams, Miller, Albee, Hellman, and Simon.

ENGL 7244. African-American Novel. 3 Hours.
Surveys major nineteenth- or twentieth-century African-American novelists, such as Francis Harper, Charles Chestnutt, Zora Neale Hurston, Nella Larsen, Toni Morrison, Ralph Ellison, James Baldwin, and Ishmael Reed.

ENGL 7251. Contemporary American Fiction. 3 Hours.
Surveys major developments in American fiction of the period from roughly 1945 to the present against the cultural background of that period. Considers such categories as postmodernism, southern fiction, Jewish fiction, black fiction, women’s fiction, and multicultural fiction since the civil rights era, and such writers as Mailer, Kerouac, Welty, Malamud, Didion, Gaines, Silko, and Chin.

ENGL 7261. Medieval Literature. 3 Hours.
Offers a survey of the major works of the medieval period, excluding Chaucer. Focuses on texts in Middle English from the twelfth century through the fifteenth, and covers the range of available genres and forms including the short religious and secular lyric, debate poetry, the dream vision, religious prose, the romance, fifteenth-century Chaucerian imitations, and fifteenth-century ballads. The critical focus may include questions and problems of sources, influence, genre, voice, and the representation of the subject.

ENGL 7262. Renaissance Literature. 3 Hours.
Studies major prose, poetry, and dramatic literature by such authors as Erasmus, Wyatt, Surrey, More, Sidney, Marlow, Spenser, Raleigh, and Shakespeare.

ENGL 7263. 17th-Century Literature. 3 Hours.
Covers major prose, dramatic literature, and poetry of the seventeenth century including Bacon, Behn, Cavendish, Hobbes, Browne, Bunyan, Donne, Herbert, Jonson, Marvell, and others.

ENGL 7264. Restoration and Early 18th-Century Literature. 3 Hours.
Surveys drama, poetry, and criticism including Restoration theater, Dryden, Pope, Swift, Finch, Addison, Steele, and Gay.

ENGL 7266. Victorian Literature. 3 Hours.
Treats such topics as Victorian masculinities; female poetic identity; the move to aestheticism and decadence in the latter nineteenth century; and resonances of the 1890s to our own fin-de-siècle. Considers such figures as R. Browning, E.B. Browning, Christina Rossetti, Florence Nightingale, Swinburne, Pater, Stevenson, Wilde, H.G. Wells, and Freud.

ENGL 7271. Chaucer. 3 Hours.
Focuses on the works of Chaucer in their late medieval settings; examines both the intertextual tradition that produced such texts as The Book of the Duchess, The Canterbury Tales, and Troilus and Criseyde, and the literary context in which Chaucerian texts have been and continue to be read. Critical issues may include questions of voice and persona, the relationship of author to text, the problems of influence and genre, and medieval views of race, class, and gender.

ENGL 7272. Shakespeare's Tragedies. 3 Hours.
Investigates the question of genre and the critical debates surrounding the major tragedies. Plays studied include King Lear, Hamlet, and Macbeth.

ENGL 7273. Shakespeare's Comedies. 3 Hours.
Considers Shakespeare’s three major types of comedy (comedy of action, festive comedy, and the problem comedies) and the comic impulse of the later romances.

ENGL 7274. Topics in Shakespeare. 3 Hours.
Addresses special issues, such as “Shakespeare on Film,” the hybrid material of the history plays, and his nondramatic works (sonnets “Rape of Lucrece” and “Venus and Adonis”). May be repeated without limit.

ENGL 7275. Milton. 3 Hours.
Presents Milton’s poetic and intellectual achievement through analysis of his major work. Emphasizes Paradise Lost as an expression of Renaissance thought and the culmination of the epic tradition.

ENGL 7281. Topics in Medieval Literature. 3 Hours.
May consider the following: Anglo Saxon literature (including poems such as Beowulf, Judith, The Wanderer, The Seafarer, and a selection of prose); the poems of the Pearl Poet (Sir Gawain and the Green Knight, Pearl, Cleanness); women and/or the Middle Ages; medieval literature and medievalism; the medieval romance, Malory’s Morte Darthur; religious, mystical, and didactic works; medieval travel literature; or William Langland’s Piers Plowman. May be repeated without limit.

ENGL 7282. Topics in Renaissance Literature. 3 Hours.
Considers specific topics in the literature of the sixteenth and seventeenth centuries, such as the sonnet sequence, Renaissance women, and utopian and travel literature. May be repeated without limit.

ENGL 7283. Topics in 17th-Century Literature. 3 Hours.
Considers specific topics in literature from 1600 to approximately 1700, such as metaphysical and religious poetry, the rise of the novel, and drama. May be repeated without limit.

ENGL 7284. Topics in 18th-Century Literature. 3 Hours.
Explores in depth a topic, theme, or genre in eighteenth-century British literature, such as satire; London’s city culture; literary theory; the emerging women writers; the essay; or a major writer, for example, Jonathan Swift, Jane Austen, or Henry Fielding. May be repeated without limit.

ENGL 7285. Topics in Romanticism. 3 Hours.
Explores a topic, theme, or genre in Romantic literature, such as Romantic autobiography or Romantic conceptions of the poet; may also explore intensively the work of one major British writer of the Romantic era. May be repeated without limit.

ENGL 7286. Topics in Victorian Literature. 3 Hours.
Offers a focus on special topics such as gender issues, the 1890s, Victorian fantasy, and science fiction. May be repeated without limit.

ENGL 7287. Topics in 20th-Century British Literature. 3 Hours.
Examines the cultural contexts that produced twentieth-century British literature; the representation of gender, race, and class; and the modern, the postmodern, and the postcolonial. May be repeated without limit.
ENGL 7291. 18th-Century Novel. 3 Hours.
Focuses on Behn, Defoe, Fielding, Richardson, Walpole, Sterne, Beckford, and Austen.

ENGL 7292. Romantic Poetry. 3 Hours.
Surveys representative forms and works of the major poets of the English Romantic Period (1798-1832): Blake, Wordsworth, Coleridge, Byron, Shelley, Keats, and representative women writers, such as Baile, Barbauld, and Hemans. Studies poetry in the historical and intellectual context of its time.

ENGL 7293. Victorian Poetry. 3 Hours.
Focuses on Tennyson, R. Browning, E.B. Browning, Arnold, Christina Rossetti, D.G. Rossetti, Swinburne, and Hopkins, with emphasis on issues of gender, poetic form, and the movement toward modernism.

ENGL 7294. Victorian Novel. 3 Hours.
Explores the Victorian novel emphasizing recent critical approaches (for example, gender studies, new historicist, or psychoanalytic). Considers such figures as C. Bronte, E. Bronte, Dickens, Eliot, Gaskell, Trollope, and Hardy.

ENGL 7295. 20th-Century British Drama. 3 Hours.
Explores the evolution of British drama from Shaw to Tom Stoppard, emphasizing the influence of Ibsen and later European dramatists; the Irish influence of Yeats, Synge, and O’Casey; the traumas of two world wars; and the steady growth in the variety and power of British dramatic productions. Also considers such writers as Samuel Beckett, John Osborne, Harold Pinter, and Caryl Churchill.

ENGL 7296. 20th-Century British Fiction. 3 Hours.
Explores twentieth-century British fiction, emphasizing recent critical approaches (feminist, postcolonial, or narratological). Considers such figures as Forster, Conrad, Lawrence, Woolf, Lessing, E. Waugh, Rushdie, Byatt, Carter, Murdock, and Naipaul.

ENGL 7303. Creative Writing Workshop. 3 Hours.
Comprises advanced work in creative writing.

ENGL 7311. Linguistics. 3 Hours.
Examines how linguists have begun to map out the part of our mental space devoted to language. Their inquiry centers on several questions: What do people know when they know a language? How does that knowledge get there? How is it organized? This course concentrates on all three. Explores some of the rules that we unconsciously follow as language users, which results in a new way of thinking about language. With this new perspective, we move on to issues that are often the topic of social and political debates: gender in language, dialects (for instance, Boston English, Chicano English, and African-American English or Ebonics), standards and attitudes, and nature vs. nurture, among others.

ENGL 7312. Syntax. 3 Hours.
Explores how speakers of a language know a remarkable range of subtle facts about their language, facts that they were never explicitly taught. For instance, in the sentence, "Betty talked to Wilma about herself," herself is ambiguous (it can be Betty or Wilma). But in "Betty expected Wilma to talk about herself," herself can refer only to Wilma. Why should this be? The difference comes from the subtle rules that underlie every speaker’s ability to speak and understand their native language. Examines just what these rules look like, and how we come to know them. Through weekly readings and problem sets, students begin to map out their own "mental grammar," the system that forms their unconscious knowledge of language.

ENGL 7313. Semantics. 3 Hours.
Investigates the realm of meaning in language, and explores the different accounts for how we understand words and are able to use them to create complex meanings. What does a word mean, and how do we know what it means? Part of the course considers meaning at the word level: how can we define words and what relationships hold between sets of words? Another part examines meaning at the sentence level: sentential ambiguity, relations between sentences, and how the whole meaning of a sentence can be understood. A third part focuses on language at the discourse level, looking at the ways that language can be used directly or indirectly to accomplish speech acts.

ENGL 7321. Topics in Linguistics. 3 Hours.
Offers varied topics and may focus on one or more of the core areas in linguistics: syntax, semantics, morphology, and phonology. Or it may focus on other areas, such as the lexicon, dialect, metaphor, language acquisition, prescriptive grammar, or language and society. May be repeated without limit.

ENGL 7322. Linguistics and Literature. 3 Hours.
Introduces stylistics, the study of formal properties of poetry and prose. Considers general questions: Are there constraints on creativity? What relationship holds between form and meaning? What is the nature of metaphor? How can we characterize author style, genre style? Analyzes texts of representative major writers for linguistic features. Focuses on how linguistic methods can contribute to critical response.

ENGL 7323. Linguistics and Writing. 3 Hours.
Explores topics in textuality and text cohesion, distinguishing unified text from a string of unrelated sentences. Studies lexical, semantic, and syntactic cohesion, paragraph patterning, and information flow. Analyzes diverse nonfictional prose selections for style features. Considers expressive, persuasive, scientific, informative, and exploratory forms of discourse.

ENGL 7324. History of the English Language. 3 Hours.
Traces the development of English using linguistic readings and historical documents (letters, journals, or literary selections) from various periods and representing a range of styles (formal to informal). Studies changes in the sound system, inflectional system, vocabulary, and syntax of English, as well as the development of prose style. Considers issues in language change: the influence of foreign invasion, relocation, dialect dominance, and literacy.

ENGL 7325. Issues in English Grammar. 3 Hours.
Explores how native speakers of a language we manipulate a vast number of symbols, as each day we make up and understand a stream of brand-new sentences. This effortless and completely unconscious ability depends on a set of unconscious rules, a linguistic system called the "mental grammar." Investigates what this grammar looks like in an attempt to understand the basics of how language works. Our focus is on three areas: syntax (sentence structure), morphology (word structure), and phonology (sound structure). Part of each class has a "workshop" format with a slant toward "doing" linguistics: working with data, analyzing it, and ultimately explaining it.

ENGL 7326. Gender and Language. 3 Hours.
Considers language as a reflector of social practice and as a means of influence and expression of power. Through a review of current research, explores such questions as is language inherently biased? Do men and women use language differently? Covers speech styles, patterns of conversational interaction, and language use in institutional settings: the courtroom, the doctor’s office, the business meeting, the TV talk show, the university classroom. Reviews material from diverse fields including politics, advertising, news media, and literature.
ENGL 7331. Film Studies. 3 Hours.
Introduces the basic methods of film analysis, the history of cinema, and recent theoretical debates within film studies. Provides familiarity with ways of analyzing films in terms of editing, shot composition, framing, mise-en-scène, and the like, with the historical changes in Hollywood and in international cinema, and with such current theories as structuralism and semiotics.

ENGL 7332. Topics in Film. 3 Hours.
Focuses on some specific dimension of film studies-a genre of film, such as film noir, a director like Alfred Hitchcock or Francis Ford Coppola, a film movement like expressionism or social realism, or a particular historical moment in film history, such as post-1967 Hollywood. Topics chosen determine texts and films. May be repeated without limit.

ENGL 7333. American Film. 3 Hours.
Offers a history of American film from the beginnings to the present. Pays particular attention to the way we negotiate social norms and values, reproduce or contest dominant ideologies, and represent (or fail to represent) their historical movement. Considers films from Birth of a Nation to Citizen Kane to The Godfather to Thelma and Louise.

ENGL 7334. Contemporary Film. 3 Hours.
Offers a survey of contemporary film, both American and international. Studies the major new developments in film, from the new ethnic filmmaking to the recent turn to gender and sexuality. Also engages some of the central critical and theoretical issues and debates in film studies, from spectatorship to postmodernism. A large part of the course is devoted to the analysis of visual and narrative form and to the link between form and meaning.

ENGL 7341. Contemporary Critical Theory. 3 Hours.
Introduces the study of modern and contemporary literary theory and criticism including "New Critical," Marxist, feminist, psychoanalytic, structuralist, poststructuralist, phenomenological, and other approaches.

ENGL 7342. Topics in Criticism. 3 Hours.
Examines such topics in critical theory as narrative, cultural criticism, representation, reader response, feminist theory, postcolonial studies, and comparative literature. May be repeated without limit.

ENGL 7351. Topics in Literary Study. 3 Hours.
Focuses on literature on a thematic, formal, or generic basis. May include black women writers, poetry of nature. May be repeated without limit.

ENGL 7352. Topics in Genre. 3 Hours.
Examines such topics in genre criticism as biography, autobiography, satire, and children’s literature. May be repeated without limit.

ENGL 7353. Topics in Fiction. 3 Hours.
Examines such subjects as short fiction, the romance, and the short-story cycle. May be repeated without limit.

ENGL 7354. Topics in Drama. 3 Hours.
Examines such subjects as tragic drama, comic drama, and absurdist drama. May be repeated without limit.

ENGL 7355. Topics in Poetry. 3 Hours.
Examines such subjects as epic poetry, the lyric, poetry of the seasons, and confessional poetry. May be repeated without limit.

ENGL 7356. Topics in Nonfiction Prose. 3 Hours.
Examines writings in nonfiction prose in such areas as biography, history, science, and technology. Varies according to the design of the instructor. May be repeated without limit.

ENGL 7357. Topics in Literary Relations. 3 Hours.
Explores relations among national literatures. Covers such subjects as modernism in England and America, and romanticism in nineteenth-century England and America. May be repeated without limit.

ENGL 7358. Topics in Literature and other Disciplines. 3 Hours.
Examines such subjects as literature and the visual arts, literature and psychology, and literary impressionism. May be repeated without limit.

ENGL 7359. Topics in Comparative Literature. 3 Hours.
Offers topics to be announced. May be repeated without limit.

ENGL 7360. Topics in Rhetoric. 3 Hours.
Focuses on specialized topics in rhetoric, such as visual rhetoric, rhetorical criticism, rhetoric of science, issues in contemporary rhetorical theory, and rhetoric and cultural studies. Varies by semester. May be repeated without limit.

ENGL 7361. Modern Poetry. 3 Hours.
Examines the themes, techniques, and cultural contexts of modern American and British poetry, 1900-1950. Considers a range of representative poets and poems; such “movements” as imagism, proletarian poetry, and the Harlem Renaissance; such practices as collage poetics; and such issues as canon formation and the intersections of modernism and postmodernism.

ENGL 7362. Contemporary Poetry. 3 Hours.
Examines the themes, techniques, and cultural contexts of postmodern American and British poetry, 1950 to the present. Considers a range of representative poets and poems; such groups as Beat, neosurrealist, African-American, and L-A-N-G-U-A-G-E poets; such practices as field composition and performance poetry; and such issues as appropriation and the intersections of modernism and postmodernism.

ENGL 7370. Topics in Digital Humanities. 3 Hours.
Focuses on theoretical and methodological intersections among technology, computation, humanities research, and pedagogy. May cover topics such as multimodal scholarly composition, "new" and "old" media, public humanities, text encoding, text mining, digital archives, humanities tool building, geospatial analysis, topic modeling, and network mapping. Content varies by semester. May be repeated without limit.

ENGL 7371. Ethnography. 3 Hours.
Introduces a diverse set of methods, including observation and interviewing, for understanding humans in social and cultural contexts. Topics range from the nuts and bolts of designing and implementing a project to responding to the crisis of representation. Students conduct an ethnographic study and read ethnographies in anthropology and in their fields of interest. Is geared to teachers preparing to conduct classroom observations, technical communicators studying how people interact with documents and technologies, or anyone interested in ethnography as a research method and representational practice.

ENGL 7372. Reading and the Teaching of Reading. 3 Hours.
Provides teachers with the opportunity to develop a coherent theory of reading instruction coordinated with teaching writing. Recommended for teachers who have previously taken a course in the theory and teaching of writing.

ENGL 7391. Writing and the Teaching of Writing. 3 Hours.
Examines the theory and practice of writing and teaching writing. Required for stipended graduate assistants (SGAs) in their first year.

ENGL 7392. Writing and Learning Across Curriculum. 6 Hours.
Explores in depth how writing may be used to promote thinking and learning across a wide variety of disciplines. Intended primarily for high school and college instructors in the humanities, social sciences, and natural sciences. Usually given only through the Institute on Writing and Teaching at Martha’s Vineyard.
ENGL 7394. Writing Programs in Schools and Colleges. 3 Hours.
Examines both the nature of writing programs in schools and colleges and the issues that curricular changes raise for these institutions. Intended for English teachers on all levels who wish to become composition leaders in their schools. Usually given only through the Institute on Writing and Teaching at Martha’s Vineyard. Requires extensive course work in composition theory and practice.

ENGL 7395. Topics in Writing. 3 Hours.
May include the following topics: literacy and literacies; basic writing; issues of gender, race, and class in the classroom; writing assessment; or collaborative learning. May be repeated without limit.

ENGL 7396. Composition Pedagogy. 3 Hours.
Examines exemplary theory, research, and practice in the teaching of writing. Considers such topics as the writing process, the role of reading in the writing classroom, development and assessment, and teaching in a diverse society.

ENGL 7397. Responding to Learners. 3 Hours.
Examines and puts into practical use a variety of methods of analyzing writing. Studies both professional and student writing. Provides the tools for analyzing and improving student writing, assessing the writing of their students, and designing appropriate writing assignments and activities. Provides an opportunity to begin the development of an integrated writing curriculum from the elementary to the college level.

ENGL 7398. Writing and Reading in Content Areas. 3 Hours.
Examines some characteristic student and professional writing in the humanities, sciences, and social sciences. Attempts to help participants see how students can use writing as a way of knowing and learning, not just in the English class but, for example, in the biology, history, or even mathematics class. Usually given only through the Institute on Writing and Teaching at Martha’s Vineyard.

ENGL 7603. Designing Teacher Research. 2 Hours.
Prepares participants for research to be conducted in ENGL 7663 during the academic year at the home institution. Examines some published case studies of teaching and writings, and explores relevant methods of data analysis, observation techniques, interview and questionnaire construction, sampling procedures, experimental design, and writing protocol analysis. Usually given only through the Institute on Writing and Teaching at Martha’s Vineyard.

ENGL 7663. Teacher-Research Fieldwork. 3 Hours.
Allows participants to conduct the independent research planned in ENGL 7603. Provides resources available for this research at the home institution including the participants’ individual teaching practices, course or departmental curriculum, the writing of their students and of students in other classes, the practices of other teachers and administrators, as well as published books, reports, and articles on composition. Provides for student to collect, collate, and interpret data according to the guidelines established at the institute and then prepare a project in which they present their findings. Usually given only through the Institute on Writing and Teaching at Martha’s Vineyard.

ENGL 7671. Teacher-Research Final Project. 1 Hour.
Provides for participants who have prepared ENGL 7603 projects to present their findings, draw their conclusions, and discuss the implications of their research for further study. Guides participants in the ENGL 7603 and ENGL 7663 sequence. Usually given only through the Institute on Writing and Teaching at Martha’s Vineyard.

ENGL 7960. Exam Preparation—Doctoral. 0 Hours.
Offers an opportunity to prepare for the PhD qualifying exam under faculty supervision.

ENGL 7966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

ENGL 7976. Directed Study. 1-4 Hours.
Offered by arrangement. May be repeated without limit.

ENGL 7977. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ENGL 7990. Thesis. 3 Hours.
Offers thesis supervision by members of the department. May be repeated without limit.

ENGL 7996. Thesis Continuation. 0 Hours.
Offers thesis supervision by members of the department.

ENGL 8405. Directed Research Project. 3 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

ENGL 8406. Directed Writing Project. 3 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

ENGL 8407. Teaching Practicum. 1 Hour.
Gives students the opportunity to observe a senior faculty member teaching an undergraduate course in American or British literature, literary studies, rhetoric, composition studies, or linguistics. Students meet regularly with the faculty member to discuss teaching practices and other pedagogical issues and submit a term project discussing the experience in the context of the scholarship of teaching. May be repeated without limit.

ENGL 8960. Exam Preparation—Doctoral. 0 Hours.
Offers the student the opportunity to prepare for the PhD qualifying exam under faculty supervision.

ENGL 8966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience. May be repeated without limit.

ENGL 8984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

ENGL 9000. PhD Candidacy Achieved. 0 Hours.
Indicates successful completion of the doctoral comprehensive exam.

ENGL 9984. Research. 1-4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

ENGL 9986. Research. 0 Hours.
Offers the student the opportunity to conduct full-time research. May be repeated up to three times.

ENGL 9990. Dissertation. 0 Hours.
Offers dissertation supervision by members of the department. May be repeated once.

ENGL 9996. Dissertation Continuation. 0 Hours.
Offers dissertation supervision by members of the department. May be repeated without limit.

ENG 0010. Elements of Writing. 2 Hours.
Reviews the structural patterns of current English. Students practice writing sentences, paragraphs, and short papers.
ENG 0901. Teaching Literature and Film. 6.8 Hours.
Seeks to provide English teachers with an approach for teaching literature and film using the great ideas of philosophy to unlock meaning and discover insight into the secondary school canon. The goal of this approach is for students of all skill levels to be able to identify themes in literature and films and engage in intelligent discussions of ideas and characters found within the existing curriculums. Participants read short selections, view films, and explore core ideas from both Eastern and Western philosophy in roundtable discussions. Offers teachers an opportunity to gain a broader understanding of human nature, ethics, friendship and love, moral character, happiness, justice, equality, knowledge, duty, and freedom and to enrich their literature lessons while enriching the lives of their students and themselves.

ENG 0902. From Socrates to Salinger: Using the Great Ideas of Western Philosophy. 6.8 Hours.
Offers English teachers an opportunity to develop a new approach to teaching literature and film using the ideas of Western philosophy to unlock the meaning and discover the insight into the secondary school canon. In the hands of good teachers, students of all skill levels are able to identify themes in literature and films and engage in intelligent discussions of ideas and characters found within our existing curriculums. Participants read short selections, view classic films, and explore core ideas from Western philosophy in roundtable discussions. Explores an understanding of ideas such as human nature, ethics, friendship and love, moral character, happiness, justice, equality, knowledge, duty, and freedom.

ENG 0903. Dancing the Texts. 6.8 Hours.
Explores educational practice. The concept of "the unit" is ubiquitous, but might there be another way to organize a study? Readings include several American texts in various genres simultaneously, keeping them all open before us, making connections between them, discovering the obvious and not-so-obvious bridges, all the while expecting rich edge effects and marvellous serendipity.

ENG 0904. Teaching Poetry Writing to Adolescents. 6.8 Hours.
Explores how best to begin, how much to criticize, how much "theory" vs. how much unfettered "playing around," what to expect from high school students, of what are they capable poetically, how to know if what they write is any good, and if you as a teacher have to write, too. Participants in this class take part in what the instructor calls "the high-toned soap opera of the writing life."

ENG 0905. The Hero Journey: Discovering Eastern Philosophy in Literature and Film. 6.8 Hours.
Offers students an opportunity to develop a new approach to teaching literature and film using the great ideas of Eastern philosophy to unlock the meaning and discover the insight into the secondary school canon. Focuses on the concept of the hero journey, the archetypal tale of the dangerous adventure heroes take in search of the key to unlocking mystery and meaning. Uses canonical texts and classic American films to trace the mileposts on this universal trek.

ENG 0906. Writing and Teaching Memoir with Middle and High School Students. 6.8 Hours.
Considers ways to engage students in writing and learning from their own stories. Adolescents are often preoccupied with self. Drawing on that interest is a way to get them involved in reading and writing, reflecting on their lives, and learning from the contexts in which they live. Explores a variety of techniques, including group discussion, peer review, writing to prompts, and doing exercises, that could be used by participants with their own students. Readings illustrate the work of writers from a variety of backgrounds and cultures, as well as key ideas from psychology, cultural anthropology, and sociology. Considers reasons for caution and what is appropriate for students of different ages.

ENG 0907. Expository Writing: The Art of Argument. 6.8 Hours.
Designed for secondary school teachers—English teachers as well as teachers of other subjects—who plan to develop and refine information writing in content subjects. Is there a place for a writer’s voice in expository (informational) writing? What models and strategies of informational writing help writers express their voice? Offers participants an opportunity to explore the elements of exposition, read argument, write argument, and prepare an expository guidebook/teacher reference toolkit for classroom usage.

ENG 0910. Foundations of Writing. 3 Hours.
Introduces the principles of structured writing with an emphasis on understanding various rhetorical and paragraph forms. Offers students continuous practice in order to perfect skills—not only the essay and paragraph forms but also grammatical and syntactical correctness. May be repeated without limit.

ENG 0913. Writing, Reading, and Teaching the Memoir: Stories We Live By. 6.8 Hours.
Examines memories about childhood and their significant contribution to adulthood. Offers students an opportunity to explore how to construct narratives of their own lives and explore the process that allows individuals to clarify the meanings and connections within the web of personal experience, as well as to utilize tools for continuing the journey of exploration in the classroom.

ENG 0914. A World of Stories: Teaching Global Perspectives through Literature. 6.8 Hours.
Examines a variety of literature, including stories for adolescents and children from around the world. Offers students an opportunity to explore response strategies that encourage them to build bridges from their lives to the larger world and participate in thoughtful dialogue around cultural experiences in a global context.

ENG 0915. Scribbling Women. 6.8 Hours.
Designed to introduce the literature of American women writers through content that demonstrates their importance in multiple contexts, including both the literary arts and social history. Encourages participants to teach literature through the use of interactive media to engage students as listeners, writers, creators, and critics. Offers participants an opportunity to become learners, researchers, and curriculum developers, as they create lessons for their own classrooms in accordance with the Massachusetts Department of Elementary and Secondary Education.

ENG 0920. Creative Drama: Literature in Action. 6.8 Hours.
Offers students an opportunity to create and use their imaginations, to experience classic drama through a new lens, and to learn how to integrate creative drama into classroom activities. Designed for the English language arts classroom, this process-oriented, hands-on course seeks to engage learners in a variety of creative activities designed to effectively illuminate the relationship between literary text and performance. Because a play is only completely realized when performed, this course aims to consider questions of performance that open up the texts in exciting ways. Offers students an opportunity to read and study plays, exploring what it means to bring a play to life, how plays represent experience, what dramatic form is, and how it differs from that of fiction and poetry.
ENG 1103. College Writing 1 for Nonnative Speakers. 3 Hours.
Offers students an opportunity to develop written communication skills and basic research techniques in preparation for English-language college writing in their majors. Incorporates reading, research, and critical thinking in the development of expository writing—the kind of objective, audience-directed prose used in college and the workplace to explain and defend ideas. Emphasizes planning, drafting, revising, and correct citation in essays, along with development of focus, organization, and paragraph/sentence structure. Offers opportunities for in-class assignments and peer-review activities. Requires students to analyze and draft writing assignments from topics covered in ENG 1103.

ENG 1104. Lab for ENG 1103. 1 Hour.
Requires students to analyze and draft writing assignments from topics covered in ENG 1103.

ENG 1105. College Writing 1. 3 Hours.
Offers students an opportunity to develop written communication skills and basic research techniques in preparation for college writing in their majors. Incorporates reading, research, and critical thinking in the development of expository writing, the kind of objective, audience-directed prose used in college and the workplace to explain and defend ideas. Emphasizes planning, drafting, revising, and correct citation in essays, along with development of focus, organization, and paragraph/sentence structure. Offers opportunities for in-class assignments and peer-review activities in addition to extended essays developed outside of class. Students must pass with a C or higher in order to receive credit and continue on to ENG 1107.

ENG 1106. Lab for ENG 1105. 1 Hour.
Requires students to analyze and draft writing assignments from topics covered in ENG 1105.

ENG 1107. College Writing 2. 3 Hours.
Builds on students’ skills of written communication and basic research in preparation for college writing in their majors. Offers opportunities to emulate and incorporate various rhetorical strategies in the development of written analysis and researched argumentation. Focuses on techniques for logical analysis (inductive and deductive reasoning) and effective reasoning, establishing credibility, and emotional appeals to develop persuasive arguments. Emphasizes planning, drafting, revising, and correct citation in essays. Offers opportunities for in-class assignments and peer-review activities in addition to extended essays developed outside of class. Students must pass with a C or higher in order to receive credit and continue to ENG 3105 or ENG 3107.

ENG 1108. Lab for ENG 1107. 1 Hour.
Requires students to analyze and draft writing assignments from topics covered in ENG 1107.

ENG 1200. Introduction to Literature. 3 Hours.
Surveys basic concepts in literature as these are integrated into various genres, such as poetry, short fiction, the novel, and drama. Examines fundamentals of literary analysis (plot, character, symbolism, theme, irony), as well as critical principles for making literary judgments. Discusses the definition and characteristics of the term “story,” and offers students an opportunity to analyze the role stories play in culture, politics, and other areas of daily life.

ENG 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENG 2105. Writing Workshop. 3 Hours.
Offers students an opportunity to continue developing writing skills presented in ENG 1107. Requires students to have a strong grasp of English-language grammar and mechanics. Offers students an opportunity to learn the tools and techniques involved in analyzing, synthesizing, and evaluating argumentative texts. In addition to shorter writing assignments, students create a polished documented research paper of at least 10 pages, which must include proper MLA citation and effective research strategies. Emphasizes argumentative writing, peer review, and research skills aimed at preparing students for college writing in their majors. This is a required course for all Global Classroom students, and all students must pass with a C or higher in order to receive credit and continue to ENG 3105 and ENG 3107.

ENG 2106. Lab for ENG 2105. 1 Hour.
Requires students to analyze and draft writing assignments from topics covered in ENG 2105.

ENG 2230. English Literature 1. 3 Hours.
Explores English literature from the Middle Ages to the Romantic period and might include studying works by authors such as Chaucer, Donne, Milton, Pope, Swift, Johnson, Blake, Wordsworth, Byron, and Keats.

ENG 2231. English Literature 2. 3 Hours.
Explores English literature from the Victorian era through the present and might include studying works by authors such as Browning, Tennyson, Dickens, Wilde, Hardy, Woolf, Joyce, Lessing, and Pinter.

ENG 2450. American Literature 1. 3 Hours.
Offers students an opportunity to examine the roots of American thought and culture to reach a broad understanding of many of the major currents of contemporary American thought. Explores American literature from its Puritan beginnings through the turn of the 20th century. Includes works by such writers as Whitman, Dickinson, Twain, James, Hemingway, Moore, Faulkner, Ellison, Cahan, and Morrison.

ENG 2451. American Literature 2. 3 Hours.
Examines the continuing themes of the nature of the American dream, the desire to create a distinctly American literature, and continues through the artistic and literary movement known as modernism. Surveys the major American writers and major literary works through these eras. Includes works by such writers as Whitman, Dickinson, Twain, James, Hemingway, Moore, Faulkner, Ellison, Cahan, and Morrison.

ENG 3105. Writing for the Professions: Science and Engineering. 3 Hours.
Offers writing instruction for students considering careers or advanced study in fields of science, technology, engineering, and mathematics. Students practice and reflect on writing in professional, public, and academic genres as they plan, research, write, and analyze various forms of technical communications such as technical reports, progress reports, proposals, instructions, presentations, and technical reviews relevant to technical professions and individual student goals. Offers students opportunities to evaluate a wide variety of sources and to develop communication skills in audience analysis, critical research, peer review, and revision. Students must pass with a C or higher in order to receive credit.

ENG 3106. Lab for ENG 3105. 1 Hour.
Requires students to analyze and draft writing assignments from topics covered in ENG 3105. Coreq ENG 3105.
ENG 3107. Writing for the Professions: Business and the Social Sciences. 3 Hours.
Offers writing instruction for students considering careers or advanced study in business administration and the social sciences. Students practice and reflect on writing in professional, public, and academic genres as they plan, research, write, and analyze various forms of business communications such as proposals, recommendation reports, letters, presentations, and emails relevant to industry. Offers students opportunities to evaluate a wide variety of sources and to develop communication skills in audience analysis, critical research, peer review, and revision. Students must pass with a C or higher in order to receive credit.

ENG 3108. Lab for ENG 3107. 1 Hour.
Requires students to analyze and draft writing assignments from topics covered in ENG 3107. Coreq ENG 3107.

ENG 3210. Writing for Young Readers. 3 Hours.
Introduces the changing world of children's literature by examining published picture books, chapter books, and young adult novels ranging from fairy tales to modern-day works. Examines the influence children's literature has on young lives and its impact on culture and communication. Encourages students to examine their own childhoods for ideas as they complete writing exercises aimed at craft development and in the production of work designed for young readers. Provides time for students to critique their own work and the work of others in writing workshops and peer-review sessions.

ENG 3220. Writing Poetry. 3 Hours.
Introduces techniques, forms, structures, and styles of both traditional and contemporary poetry. Focuses on fundamentals of poetry, including line, diction, syntax, image, trope, rhetoric, and rhythm, along with examining roles of audience, speaker, and message. Class discussion emphasizes essential terms of poetic analysis as students develop an appreciation for the challenges that poets set for both themselves and their readers. Offers students an opportunity to use developing insights to craft original polished and completed poems. Provides time for students to critique their work and the work of others in writing workshops and peer-review sessions.

ENG 3230. Writing Fiction. 3 Hours.
Introduces techniques and strategies of fiction writing. Examines key communication elements of fiction, including plot, characterization, setting, point-of-view, and various story development techniques. Students have an opportunity to read and react to a variety of texts while completing writing exercises and while generating, developing, and revising original pieces of fiction. Provides time for students to critique their own work and the work of others in writing workshops and peer review sessions. Prereq ENG 1107.

ENG 3240. Writing Nonfiction. 3 Hours.
Explores how writers translate personal experience and research into effective pieces of creative nonfiction. Studies literary journalism, personal essays, memoir, nature writing, and other subgenres to enhance understanding of this communication strategy. Class discussions analyze published works through points of view of scholar and writer, while delving into ethical considerations of writing from "real" life. Considers accurate description, scenic representation, and narrative framing, along with meaningful integration of images, videos, and Web tools. Offers students an opportunity to develop and revise original works of creative nonfiction. Provides time for students to critique their work and the work of others in writing workshops and peer-review sessions.

ENG 3260. Writing to Inform and Persuade. 3 Hours.
Focuses on techniques used in nonfiction writing to communicate ideas and influence audience point of view about "true" events or affairs. Examines a variety of nonfiction pieces and styles, such as journalism features and profiles, editorials and opinion pieces, literary essays, and visual arguments. Offers students an opportunity to advance their understanding and appreciation of informative, persuasive writing techniques as they discuss, develop, revise, and review each other's original nonfiction pieces.

ENG 3300. Literature and Business Leadership. 3 Hours.
Examines organizational leadership by studying fictional characters whose workplace challenges parallel those encountered by today's business executives. Analyzes a variety of management styles and strategies as depicted in story form to guide students' understanding of leadership as it applies to workplace responsibility, choice, risk taking, moral obligation, and self-mastery. Offers students an opportunity to use insights gained from literary examples to inform personal reflections on the meaning of leadership and the qualities that combine to make someone an effective manager of people and organizations.

ENG 3330. Literature, Technology and Culture. 3 Hours.
Investigates relationships between literature and technology and how these connections influence human culture. Explores how writers interpret roles of technology in society and examines ways literature encourages/discourages technological research and development. Seeks to guide students' understanding of how literature, technology, and society link to envision new worlds, expand imagination, and impact concepts of individuality and community. Offers students opportunities to use insights gained from literature to inform personal reflections about technology's role in culture and its impact on human life.

ENG 3440. Western World Literature. 3 Hours.
Explores literature from the ancient world through the Renaissance; the second half explores literature from the Enlightenment to the present. Covers a variety of writers and literary traditions and might include studying works by authors such as Homer, Sophocles, Virgil, Dante, Machiavelli, Cervantes, Voltaire, Goethe, Ibsen, Kafka, and Brecht.

ENG 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENG 4210. Writing for Publication. 3 Hours.
Focuses on nonfiction writing for students interested in learning how to generate story ideas and how to write and revise journalistic work for intended magazine audience/publication. Focuses primarily on development and pitch of travel or hobby-related articles for selected print or online magazines. Readings highlight a collection of publications to show what is revealed about magazines’ content and storytelling goals through use of audience, articles, structure, photos, and other elements. Offers students an opportunity to craft a manuscript and pitch letter designed for publication consideration. Provides time for students to critique their own work and the work of others in writing workshops and peer-review sessions.

ENG 4455. Topics in Shakespeare. 3 Hours.
Explores a subject or theme common to several plays by Shakespeare, such as Shakespeare's women, the tragic vision, fathers and sons, the comic and the grotesque, and Shakespeare on film. Topics change from quarter to quarter and campus to campus. Students may take this course more than once, provided it is a different topic each time.

ENG 4896. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student's approved experiential activity and integrates it with study in the academic major.
ENG 4950. Seminar. 1-4 Hours.
Offers students the opportunity to integrate knowledge and abilities gained throughout the program. This capstone course for English majors concludes with a detailed research project.

ENG 4955. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ENG 4983. Topics. 1-4 Hours.
Examines a subject or theme as various as the literature that produced it, from the tragic hero to visions of utopia, from children’s literature to the literature of the dispossessed. Topics change from term to term and campus to campus so that students may take this course more than once, provided it is a different topic each time. May be repeated without limit.

ENG 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENG 4991. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

ENG 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ENG 4993. Independent Study. 1-4 Hours.
Offers students an opportunity to undertake special research.

ENG 4994. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

ENG 4995. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

ENG 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ENG 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

ENG 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

ENG 6501. Teaching Literature and Film. 4 Hours.
Seeks to provide English teachers with an approach for teaching literature and film using the great ideas of philosophy to unlock meaning and discover insight into the secondary school canon. The goal of this approach is for students of all skill levels to be able to identify themes in literature and films and engage in intelligent discussions of ideas and characters found within the existing curriculum. Participants read short selections, view films, and explore the core ideas from both Eastern and Western philosophy in roundtable discussions. Offers teachers an opportunity to gain a broader understanding of human nature, ethics, friendship and love, moral character, happiness, justice, equality, knowledge, duty, and freedom and to enrich their literature lessons while enriching the lives of their students and themselves.

ENG 6502. From Socrates to Salinger: Using the Great Ideas of Western Philosophy. 4 Hours.
Offers English teachers an opportunity to develop a new approach to teaching literature and film using the ideas of Western philosophy to unlock the meaning and discover the insight into the secondary school canon. In the hands of good teachers, students of all skill levels are able to identify themes in literature and films and engage in intelligent discussions of ideas and characters found within our existing curriculums. Participants read short selections, view classic films, and explore core ideas from Western philosophy in roundtable discussions. Explores an understanding of ideas such as human nature, ethics, friendship and love, moral character, happiness, justice, equality, knowledge, duty, and freedom.

ENG 6503. Dancing the Texts. 4 Hours.
Explores educational practice. The concept of “the unit” is ubiquitous, but might there be another way to organize a study? Readings include several American texts in various genres simultaneously, keeping them all open before us, making connections between them, discovering the obvious and not-so-obvious bridges, all the while expecting rich edge effects and marvelous serendipity.

ENG 6504. Teaching Poetry Writing to Adolescents. 4 Hours.
Explores how best to begin, how much to criticize, how much “theory” vs. how much unfettered “playing around,” what to expect from high school students, of what are they capable poetically, how to know if what they write is any good, and if you as a teacher have to write, too. Participants in this class take part in what the instructor calls “the high-toned soap opera of the writing life.”

ENG 6505. The Hero Journey: Discovering Eastern Philosophy in Literature and Film. 4 Hours.
Offers students an opportunity to develop a new approach to teaching literature and film using the great ideas of Eastern philosophy to unlock the meaning and discover the insight into the secondary school canon. Focuses on the concept of the hero journey, the archetypal tale of the dangerous adventure heroes take in search of the key to unlocking mystery and meaning. Uses canonical texts and classic American films to trace the mileposts on this universal trek.

ENG 6506. Writing and Teaching Memoir with Middle and High School Students. 4 Hours.
Considers ways to engage students in writing and learning from their own stories. Adolescents are often preoccupied with self. Drawing on that interest is a way to get them involved in reading and writing, reflecting on their lives, and learning from the contexts in which they live. We explore a variety of techniques, including group discussion, peer review, writing to prompts, and doing exercises, that could be used by participants with their own students. Readings illustrate the work of writers from a variety of backgrounds and cultures, as well as key ideas from psychology, cultural anthropology, and sociology. We also consider reasons for caution and what is appropriate for students of different ages.

ENG 6507. Expository Writing: The Art of the Argument. 4 Hours.
Designed for secondary school teachers who plan to develop and refine their instruction in content subjects. The course is a tool kit for teaching expository writing with a focus on argument models, including classical argument.

ENG 6508. Integrating Poetry into the Elementary Classroom. 4 Hours.
Offers students an opportunity to explore the role of poetry in the classroom. Examines the use of poetry within the confines of a writing curriculum, the best strategies for teaching poetry to improve literacy, the writing skills poetry encourages and promotes, and the best texts to include. Addresses practical, hands-on applications for teaching writing and poetry, with a focus on strategies and mini-lessons for detail, word choice, strong voice, wordplay, and revision.
ENG 6509. Writing for the 21st Century. 4 Hours.
Offers students an opportunity to consider the historical changes in
the teaching of writing and how those shifts have allowed students and
teachers to think of themselves as writers. Discusses and challenges
the mandates that pressure teachers to meet standards that often work
against individualized writing instruction. Covers grammar and language
diversity, reading and writing connections, assessment and portfolios,
revision, technology, and rhetoric.

ENG 6510. Literacy and Leadership: Professional Research in English
Studies. 4 Hours.
Focuses on the professional research skills needed to define literacy
curriculum goals for a department, school, or program. Considers how to
craft strategies, presentations, and written texts about literacy for a broad
public audience. Topics include the challenges to the contemporary
classroom, such as how to help struggling readers, how to support
English-language learners, how to prepare for AP exams, as well as ways
of integrating visual rhetoric and media into the English/language arts
curriculum.

ENG 6513. Writing, Reading, and Teaching the Memoir: Stories We Live
By. 4 Hours.
Examines memories about childhood and their significant contribution
to adulthood. Offers students an opportunity to explore how to construct
narratives of their own lives and explore the process that allows
individuals to clarify the meanings and connections within the web of
personal experience, as well as to utilize tools for continuing the journey
of exploration in the classroom.

ENG 6514. A World of Stories: Teaching Global Perspectives through
Literature. 4 Hours.
Examines a variety of literature, including stories for adolescents and
children from around the world. Offers students an opportunity to explore
response strategies that encourage them to build bridges from their lives
to the larger world and participate in thoughtful dialogue around cultural
experiences in a global context.

ENG 6515. Scribbling Women. 4 Hours.
Designed to introduce the literature of American women writers
through content that demonstrates their importance in multiple
contexts, including both the literary arts and social history. Encourages
participants to teach literature through the use of interactive media
to engage students as listeners, writers, creators, and critics. Offers
participants an opportunity to become learners, researchers, and
curriculum developers, as they create lessons for their own classrooms
in accordance with the Massachusetts Department of Elementary and
Secondary Education.

ENG 6520. Creative Drama: Literature in Action. 4 Hours.
Offers students an opportunity to create and use their imaginations,
to experience classic drama through a new lens, and to learn how to
integrate creative drama into classroom activities. Designed for the
English language arts classroom, this process-oriented, hands-on course
seeks to engage learners in a variety of creative activities designed
to effectively illuminate the relationship between literary text and
performance. Because a play is only completely realized when performed,
this course aims to consider questions of performance that open up the
texts in exciting ways. Offers students an opportunity to read and study
plays, exploring what it means to bring a play to life, how plays represent
experience, what dramatic form is, and how it differs from that of fiction
and poetry.

ENG 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be
repeated without limit.

ENG 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions.
May be repeated without limit.

ENG 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

ENG 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

ENG 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

ENG 6980. Capstone. 1-4 Hours.
Provides eligible students with an opportunity for work experience.

ENG 6983. Topics. 1-4 Hours.
Covers special topics in English. May be repeated without limit.

ENG 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or
produces a product related to the student’s major field. May be repeated
without limit.

ESL 0070. Listening and Speaking. 0 Hours.
Provides listening and speaking practice for students to improve
their pronunciation, listening comprehension, and speaking skills for
university-level classroom success. Students are required to read and
discuss short business cases each week, incorporating professional
development themes that are practiced through role-play raised in
the weekly case discussion. Additionally, students are required to
give a presentation about a company where they would like to work,
participating in dictation and pronunciation exercises to strengthen their
language skills. May be repeated without limit.

ENGW 1101. Introductory Writing—SOL (Speakers of Other Languages). 4
Hours.
Introduces students to the components of the writing process, from
generating ideas to drafting and revising. In a workshop setting, students
learn to read texts of some complexity (which in turn serve as the
occasion for their own writing), and to write expository prose that makes
use of a variety of rhetorical strategies and research methods while
demonstrating a control of the conventions of standard edited written
English. Requires students to write multiple drafts and emphasizes the
writing process as well as the quality of the finished product. Students
must keep a portfolio of their work. Requires diagnostic placement for
nonnative speakers.

ENGW 1102. First-Year Writing for Multilingual Writers. 4 Hours.
Designed for students whose first or strongest language is not English.
Parallels ENGW 1111 but focuses on the concerns of multilingual writers.
Students study and practice writing in a workshop setting; read a range
of texts in order to describe and evaluate the choices writers make and
apply that knowledge to their own writing; explore how writing functions
in a variety of academic, professional, and public contexts; and write for
various purposes and audiences in multiple genres and media. Offers
students an opportunity to learn how to conduct research using primary
and secondary sources and to give and receive feedback, to revise their
work, and to reflect on their growth as writers.
ENGW 1110. Introductory First-Year Writing. 4 Hours.
Designed for students who would benefit from an extra semester of writing instruction before taking ENGW 1111. Students study and practice writing in a workshop setting. Introduces students to college-level writing, reading, and research. Offers students an opportunity to give and receive feedback, to revise their work, and to reflect on their growth as writers.

ENGW 1111. First-Year Writing. 4 Hours.
Designed for students to study and practice writing in a workshop setting. Students read a range of texts in order to describe and evaluate the choices writers make and apply that knowledge to their own writing and explore how writing functions in a range of academic, professional, and public contexts. Offers students an opportunity to learn how to conduct research using primary and secondary sources; how to write for various purposes and audiences in multiple genres and media; and how to give and receive feedback, to revise their work, and to reflect on their growth as writers.

ENGW 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENGW 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENGW 3250. Writing for the Professions. 4 Hours.
Introduces the vocabulary and philosophy of business communications. Offers students an opportunity to practice planning, writing, and analyzing effective industry-related letters and memoranda and to apply the writing process (brainstorm, draft, focus, revise, edit) successfully to compose letters, emails/memos, proposals, and other types of writing and correspondence associated with various industries.

ENGW 3302. Advanced Writing in the Technical Professions. 4 Hours.
Offers writing instruction for students in the College of Engineering and the College of Computer and Information Science. Students practice and reflect on writing in professional, public, and academic genres—such as technical reports, progress reports, proposals, instructions, presentations, and technical reviews—relevant to technical professions and individual student goals. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and develop expertise in audience analysis, critical research, peer review, and revision.

ENGW 3303. Advanced Writing in the Environmental Professions. 4 Hours.
Provides writing instruction for students in fields related to environmental studies. Students develop an in-depth analytic or recommendation report about a complex environmental concern related to their majors and/or their co-op or other personal or professional experiences. In a workshop setting, students evaluate scholarly and popular sources, practice a variety of professional and academic forms of writing and communication, and develop expertise in audience analysis, critical research, peer review, and revision. Writing is guided in stages from initial topic exploration and a formal proposal through drafts and progress reports to a final polished report, presented in a bound portfolio with a cover letter, an abstract, and other writing samples.

ENGW 3304. Advanced Writing in the Business Administration Professions. 4 Hours.
Offers writing instruction for students in the D'Amore-McKim School of Business. Students practice and reflect on writing in professional, public, and academic genres—such as proposals, recommendation reports, letters, presentations, and e-mails—relevant for careers in business. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and develop expertise in audience analysis, critical research, peer review, and revision.

ENGW 3305. Advanced Writing in the Criminal Justice Professions. 4 Hours.
Offers writing instruction for students in criminal justice. Students practice and reflect on writing in professional, public, and academic genres—such as reports, protocols, press releases, and public service announcements—relevant for careers in criminal justice and related fields. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and develop expertise in audience analysis, critical research, peer review, and revision.

ENGW 3306. Advanced Writing in the Health Professions. 4 Hours.
Offers writing instruction for students in the Bouvé College of Health Sciences. Students practice and reflect on writing in professional, public, and academic genres—such as literature reviews, case studies, protocols, and care instructions—relevant for careers in nursing, pharmacy, and other health professions. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and develop expertise in audience analysis, critical research, peer review, and revision.

ENGW 3307. Advanced Writing in the Sciences. 4 Hours.
Offers instruction in writing for students considering careers or advanced study in the physical or life sciences. By exploring research literature and reflecting on their own experiences, offers students an opportunity to identify issues of interest in their field and analyze how scientific texts make claims, invoke other scientific literature, offer evidence, and deploy key terms. Through analysis and imitation, exposes students to the challenges of the scientific project, such as the use of quantitative data and visual presentation of evidence. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and develop expertise in audience analysis, critical research, peer review, and revision.

ENGW 3308. Advanced Writing in the Social Sciences. 4 Hours.
Offers instruction in writing for students considering careers or advanced study in the social sciences. By exploring research literature and reflecting on their own experiences, offers students an opportunity to identify issues of interest and analyze how texts make claims, invoke other social science literature, offer evidence, and deploy key terms. Through analysis and imitation, exposes students to the challenges of the social science project, including the collection of data on human subjects and the ethical presentation of evidence. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and develop expertise in audience analysis, critical research, peer review, and revision.
ENGW 3309. Advanced Writing in the Humanities. 4 Hours.
Offers instruction in writing for students considering careers or advanced study in the humanities. By exploring critical literature and reflecting on their own experiences, offers students an opportunity to identify issues of interest and analyze how texts make claims, invoke primary and secondary texts, offer evidence, and deploy key terms. Through analysis and imitation, exposes students to the challenges of the humanities project, including the framing of interpretive questions and the presentation of textual evidence. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and develop expertise in audience analysis, critical research, peer review, and revision.

ENGW 3310. Advanced Writing in Literature. 4 Hours.
Builds upon courses in the English major by focusing on “writing about literature” as a genre, a kind of writing that has its own history and set of styles and conventions. Analyzes a variety of strategies that readers, including published scholars, use in writing about literature. Examines how such strategies are shaped by different literary theories and approaches to texts, as well as by assumptions about what constitutes an argument and what is an appropriate persona or voice to adopt in literary studies. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and develop expertise in audience analysis, critical research, peer review, and revision.

ENGW 3311. Advanced Writing for Prelaw. 4 Hours.
Offers instruction in writing for students considering legal careers. Introduces students to legal reasoning and to the contexts, purposes, genres, audiences, and styles of legal writing. Emphasizes the role of writing and argument in U.S. legal culture. Using strategies drawn from rhetorical theory and criticism, students examine briefs, memoranda, opinions, and other legal texts to identify and describe techniques of analysis and persuasion. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and develop expertise in audience analysis, critical research, peer review, and revision.

ENGW 3312. Advanced Writing in Education. 4 Hours.
Offers instruction in writing for students considering careers in education. Students practice and reflect on writing in professional, public, and academic genres in education, including teaching narratives, classroom ethnographies, case studies, educational policies, standards and outcomes, curricula, syllabi, lesson plans, etc. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and develop expertise in audience analysis, critical research, peer review, and revision.

ENGW 3313. Advanced Writing in the Arts, Media, and Design. 4 Hours.
Examines writing in the arts and in the fields of media and design. Explores writing for a range of public and professional audiences, including scholarly and critical. Emphasizes understanding different literacies: alphabetic, visual, musical, and sculptural. Genres might include critical reviews, grant writing, promotional pieces, interactive narratives, newspaper articles, and Web pages, among others. Offers students an opportunity for analysis, reflexive imitation, and creative interdisciplinary work.

ENGW 3314. Interdisciplinary Advanced Writing in the Disciplines. 4 Hours.
Offers writing instruction for students interested in interdisciplinary study or who wish to explore multiple disciplines. Students practice and reflect on writing in professional, public, and academic genres relevant to their individual experiences and goals. In a workshop setting, offers students an opportunity to evaluate a wide variety of sources and to develop expertise in audience analysis, critical research, peer review, and revision.

ENGW 3315. Advanced Writing in the Disciplines. 4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENGW 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

Entrepreneurship and Innovation (ENTR)

ENTR 1201. The Entrepreneurial Universe. 4 Hours.
Introduces students to the world of entrepreneurship. Covers the importance of entrepreneurship, the characteristics of entrepreneurs, and the entrepreneurship process. Describes entrepreneurship in its various forms, including startup growth ventures, entrepreneurship in small and medium enterprises, and microbusinesses.

ENTR 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENTR 2206. Global Social Enterprise. 4 Hours.
Designed to provide students with an in-depth exposure to entrepreneurship in the social sector, a rapidly growing segment of the global economy. Uses the case method to expose students to leading entrepreneurs who have developed and implemented business models to solve social problems such as extreme poverty, disease, illiteracy, and economic and social dislocation. Focuses on uniquely creative and driven people who have dedicated their lives to making a difference in the lives of others through values-based entrepreneurship.

ENTR 2215. Understanding Family Enterprise. 4 Hours.
Covers business, personal, and family issues found in family owned and managed companies, including management of the business, succession planning, entitlement, hiring, nonfamily employees, boards of advisors and directors, compensation, managing conflict, and communications. Designed for individuals who plan to enter into the management of a family business. Focuses on small and midsize firms with annual revenue of $5 million to $500 million.

ENTR 2301. The Entrepreneurial Universe. 4 Hours.
Introduces students to the world of entrepreneurship. Covers the importance of entrepreneurship, the characteristics of entrepreneurs, and the entrepreneurship process. Describes entrepreneurship in its various forms, including startup growth ventures, entrepreneurship in small and medium enterprises, and microbusinesses.

ENTR 2303. Entrepreneurial Marketing and Selling. 4 Hours.
Designed to help aspiring and serious entrepreneurship students to generate and evaluate robust marketing opportunities that may serve as the foundation for a new venture. Once a new opportunity has been vetted, students then have an opportunity to work on developing an entrepreneurial marketing plan. Covers methods for recognizing, discovering, or creating opportunities and validating those opportunities. One of the biggest challenges entrepreneurs face is coming up with the right opportunity for a new venture. This is an applied and experiential course involving field research. Two key deliverables are the opportunity assessment project and the entrepreneurial marketing plan.
ENTR 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENTR 3210. Social Impact Investing: Connecting Compassion and Capital. 4 Hours.
Studies the investors, entrepreneurs, and enterprises comprising the global impact investing universe. Social impact investing is a rapidly emerging sector within the global investment community in which investors fund innovative enterprises dedicated to creatively solving the world’s most difficult social problems, such as extreme poverty, access to clean water, sanitation, agricultural productivity, and literacy. Historically, these initiatives were organized as nonprofits or charities and received funding from donations and grants from foundations and government agencies. Today, many social entrepreneurs are instead using for-profit and hybrid business models to attract investment capital in the form of equity investments, loans, and other forms of so-called patient capital. Offers students an opportunity to develop a practical, real-world, and sustainable impact investing portfolio.

ENTR 3212. Innovation for Social Change. 4 Hours.
Examines three fundamental principles of social innovation—user-centered design, integrated systems thinking, and impact measurement—and applies them to corporate, nonprofit, government, and philanthropic contexts. Through case teaching, multidisciplinary project-based learning, guest speakers, and design research, exposes students to leading ideas and policy perspectives from various sectors and regions. Seeks to embolden student commitment to creative problem-solving approaches that transcend silos and sectors. A final team project is formulated and designed with local partners, including an implementation strategy with investors that addresses the toughest problems confronting human society involving water, food, energy, education, housing, and security for marginalized and vulnerable populations.

ENTR 3217. Global Family Business Leadership. 4 Hours.
Offers students an opportunity to develop an understanding of the nuanced challenges facing entrepreneurial leaders in different cultural settings. While family businesses have been found to be both numerically and economically significant in most countries, these enterprises worldwide share many common issues. However, there are differences that emanate from specific institutional and cultural contexts. Understanding these differences and how they can affect leadership of a family business is increasingly important for stewards of family businesses in a global marketplace. Understanding the nature of international differences and appreciating the opportunities they offer for growth-oriented family business leaders is especially important as family businesses face unique barriers to international expansion. Required participation in spring break international field project.

ENTR 3219. Microfinance: Fostering Entrepreneurship in the Developing World. 4 Hours.
Investigates, analyzes, and addresses one of the core questions surrounding microfinance: Can business, through microlending programs, truly address the needs of the desperately poor (3 billion people living on two dollars or less per day) in a meaningful, scalable, and sustainable way? Engages students in a theoretical analysis and practical examination of the field of microfinance. Examines the impact of microcredit and microenterprise development on alleviating extreme poverty in developing countries.

ENTR 3220. International Entrepreneurship and Innovation Consulting. 4 Hours.
Offers students an opportunity to learn the principles and methods of consulting to growing companies and social enterprises abroad. This is done through a set of frameworks that focus on customer segmentation, product or service requirements, product-line and service strategy, business model design, and then internationalization strategy. Working in teams, students apply these frameworks to local companies in different business sectors and then prepare to apply them to client companies in their follow-on designated destination country. The final part of the course is preparation for the international field studies. This includes an introduction to effective methods for management consulting, including goal setting, team organization, and client management.

ENTR 3305. Entrepreneurial Strategy and Business Model Design. 4 Hours.
Considers dynamic entrepreneurial startup strategy from three perspectives: positioning of the venture within a dynamic, evolving industrial ecosystem that includes major companies, startups, and universities at various parts of the value-chain; different sources of innovation, including open innovation and industry-wide technology platforms; and business model design and implementation. Explores startup strategy from these perspectives using case studies and web-based company research projects and then asks students to develop their own strategy for a startup using the frameworks studied in class.

ENTR 3306. Global Entrepreneurship. 4 Hours.
Offers an opportunity to learn how entrepreneurs start, finance, and manage small businesses. Includes a field experience in South Africa, which involves identifying startups and small business for assistance in developing a business plan and seeking debt and/or equity financing. Students have an opportunity to consider the unique challenges encountered by entrepreneurs in economically disadvantaged communities and the additional challenges presented by South Africa’s history of racism and its current struggles with HIV/AIDS. Teaches students the basic concepts and tools associated with small business management, such as preparing financial models and a written business plan and investment presentation, with the goal that they can provide meaningful consulting assistance to township entrepreneurs.

ENTR 3308. Business Economic History of South Africa. 4 Hours.
Covers the economic history of modern South Africa through lectures from faculty at the partner university in South Africa and also from the Northeastern professor. Includes the country’s transition from apartheid to its present economic and political situation. Offers an opportunity to learn how South Africa has managed to overcome the struggles of its recent past and become one of the leading emerging economies of the world with a flourishing business community. Includes readings in and study of modern South African economics, law, history, politics, and culture.
ENTR 3310. Entrepreneurship and Social Ventures. 4 Hours.
Offers students an opportunity to design the “business model” for a solution to a social problem, emphasizing how the enterprise can become self-supporting without government grants or charitable contributions. Social entrepreneurs combine the knowledge and skills used in traditional business, with a passionate commitment to having a meaningful and sustainable social impact. The most successful social enterprises solve important social problems through disruptive innovation and business models, and their greatest challenge is to not just solve social problems but to create an economic engine within the business to insure long-lasting sustainability. Through discussion, debate, and critical thinking, students identify core concepts of entrepreneurship in the social context and create a unique opportunity to apply classroom concepts to real-world problems through group projects.

ENTR 3316. Microfinance and Economic Development in Latin America. 4 Hours.
Utilizes case study methods, student presentations, discussion groups, and research to illustrate effective methods of microfinance as a poverty-alleviating tool. Offers students an opportunity to embark on extensive research on microfinance institutions. Includes a field experience component in Latin America, which involves identifying village banking sites, meeting with entrepreneurs, interviewing applicants or potential borrowers, assisting with microbusiness startups, and distributing microfinance loan capital in the creation of a village bank system. May be repeated without limit.

ENTR 3318. Business, Economics, and History of Hispaniola and Latin America. 4 Hours.
Covers the business and economic history of the field location (Caribbean, Central America, or Latin America) through lectures faculty at the partner organization and the partner university, as well as at Northeastern. Offers students an opportunity to learn about the region’s flourishing business community and global development climate. Includes readings in economics, law, history, politics, and culture; extensive site visits; and guest lecturers. May be repeated without limit.

ENTR 3319. Innovation Workshop. 4 Hours.
Examines how to identify market trends and innovations that can lead to exciting new products and services. Discusses how to form and manage product development teams, brainstorm new ideas, observe and learn from target users, design new products and services, and see how these translate into financial outcomes. Explores the role of development and manufacturing partners. Offers students an opportunity to do field research and some form of prototyping for ideas of their own creation resulting in a business presentation for investors and the prototype design.

ENTR 3320. Base of Pyramid Innovation. 4 Hours.
Explores how innovations are deployed in the developing world. There are more than 4 billion people who could experience an improvement in livelihood from innovations developed to suit their needs. However, due to the design constraints of the developing world, innovators cannot simply deploy to these places without appropriate adaptations. Offers an opportunity to help develop business models for identified technological innovations in collaboration with local deployment partners in chosen developing countries. The course consists of the following components: understanding an identified technological innovation and the local context that guided its development, developing business model concepts and prototypes, innovating business models in response to feedback, validating the business models developed, and building a deployment plan for implementation.

ENTR 3325. Sustainable Innovation. 4 Hours.
Explores the societal, regulatory, financial, engineering, and marketing dimensions of sustainable innovation. Examines fundamental frameworks for thinking about these dimensions, and then examines how companies and governments act based on case studies. Requires students to do a field project on the application of class concepts to Northeastern University across a broad range of venues, from the consumption of energy and materials to educational and community outreach programs.

ENTR 3326. Sustainability in the Latin American Business Environment. 4 Hours.
Provides a theoretical foundation of the study of business activities in the Latin American business context to ensure that externalities are valued in the economic context of the enterprises and also considered in the decision-making process. Explores different methodologies of evaluating sustainability in the entrepreneurial sector of the country of study and of assessing the social and environmental impact of their action. Offers students an opportunity to identify the impacts and directly assist in the development of decisions to control, mitigate, recuperate, and compensate for negative impacts. Requires prior completion of FINA 2720 or an environmental science course.

ENTR 3328. Field Research in Sustainable Business. 4 Hours.
Offers students an opportunity to explore, in teams with other university students in the country of study, sustainable business practices in companies ranging from agricultural enterprises to high-technology startups. Working with these companies, offers students an opportunity to create business plans and explore the trade-offs between traditional profits and environmental and social constraints. This course is designed to provide students with a firsthand experience in the dilemmas and trade-offs faced by developing countries seeking to promote economic development while protecting their resources. Requires prior completion of FINA 2720 or an environmental science course.

ENTR 3330. Lean Design and Development for Entrepreneurs. 4 Hours.
Studies how to rapidly create new products and services. Starting with an introduction to new product and service design and the innovation life cycle, the course applies the management concept of lean, agile development to concept creation, customer research, prototype development, and market validation. Offers students an opportunity to apply these skills to their own new product or service ideas and develop prototypes during the semester. In addition, the course explores cost-effective approaches for finding and managing third-party suppliers for design, engineering, and early stage production and delivery. Students are assessed not only for the quality of their ideas and project execution but also for their ability to work in teams and communicate results.

Studies the economic history of Iceland in order to explore sustainable development and its implications. Emphasizes renewable energy and commercial fishing, land use, and tourism from the twentieth century onward. Settled in the ninth century, over the course of a few hundred years of human activity the long-term equilibrium of the island was disrupted, causing severe environmental degradation. By the turn of the twentieth century, Iceland was one of the poorest countries in Europe. Over the last hundred years, Iceland transformed itself, making it a leader in the sustainable use of natural resources. Studies the process that brought about this transformation and focus on renewable energy and sustainable resource management.
ENTR 3338. Field Research in Sustainable Energy in Iceland. 4 Hours.
Explores the use of sustainable sources of energy, as well as sustainable resource management, in Iceland. Through study and field trips to power plants and businesses, offers students an opportunity to investigate the role played by hydropower and geothermal energy in providing a sustainable source of energy in a developed economy and to learn how governments and businesses work together to develop and manage renewable energy and natural resources to create a sustainable environment.

ENTR 3346. Family Business in Italy. 4 Hours.
Seeks to provide students with a comprehensive contemporary overview of Italian family business dynamics, politics, history, culture, and society, with an intentional focus on the comparisons between northern Italy vs. southern Italy. Uses formal and informal activities (lectures, company and historical site visits, dialogues) to offer students an opportunity to engage with Northeastern professors, guest lecturers, and Italian family business leaders in dialogue and discussion of contemporary challenges sustaining business across generations as well as related topics concerning the impact of current events, culture, history, and global issues.

ENTR 3348. Family Business: A Global Perspective. 4 Hours.
Studies family multinationals and the role of the family in internationalization. Many family companies are competing successfully and thriving in an increasingly globalized business environment despite assessments that they lack sufficient resources and capabilities to go global. Neither the literature on multinationals nor the growing field of family business studies has systematically investigated family multinationals yet. This course situates itself at the crossroads of internationalization studies on the one hand and family business research on the other. Offers students an opportunity to develop an understanding of the differences and the long-term transgenerational learnings that emerge from the longevity of global family businesses in different cultural settings. Explores the opportunities for family business growth by identifying pathways relevant to family business leaders. Taught abroad. May be repeated without limit.

ENTR 3401. Management of Operations and Growth in Small- and Medium-Sized Enterprises. 4 Hours.
Offers teams of students an opportunity to consult with owners of small- and medium-sized enterprises (SMEs) to develop project proposals and perform field casework specific to the needs of their SME clients. A highlight of this course is the SME consulting project. Through the project and course material, covers how to manage an SME from the day-to-day operations to strategic planning for growth. Exposes students to a variety of ways that an SME can achieve profitability and growth by generating lasting customer relationships, offering exemplary service, managing cash flow, implementing marketing strategies, and developing new and retooled products/services to reach new markets.

ENTR 3403. Managing Operations in a Technology-Based Startup Firm. 4 Hours.
Offers students an opportunity to acquire a skill set that allows them to develop a project management plan for transforming an idea or concept into a viable working product. Emphasizes the need for cross-functional collaboration throughout every phase of the effort. Explores concurrent technology practices, prototyping methods, and the approaches required for achieving the integration of business and technology interests. Utilizes case studies as part of the new-product-development process.

ENTR 3410. Entrepreneurship and Intrapreneurship in Innovation-Driven Markets. 4 Hours.
Seeks to provide students with frameworks and analytical methods for developing successful growth strategies for startups and established corporations operating in hyper-competitive, technology-intensive global industries. Reviews the key theories and tools needed to understand how technological change creates new market opportunities and allows the emergence of new business models; how firms can use technology and innovation to outcompete rivals in existing markets or to create new, fast-growing markets. Spells out how the evolution of technology and market forces in an industry affects the type of firm capabilities needed to succeed over time. Examines the business models and growth strategies of some of the most dynamic companies around the world and then elaborates on what this might mean for the student’s own career as an entrepreneur in a start-up, as an intrapreneur in a large company, or as a change agent in a family business. Combines conceptual rigor with practical relevance and personal application.

ENTR 3520. Impact Investing and Social Finance. 4 Hours.
Explores impact investing, a transformative way to work with money to achieve a more inclusive and sustainable economy. Large investors are entering the world of impact investing, a rapidly emerging space where social and ecological effects of finance are championed over maximizing shareholder value. New investment vehicles such as social impact bonds and Web exchanges are changing the role of financing institutions to better serve the needs of low-income populations around the world. Applies interdisciplinary frameworks, tools, and cases, with hands-on teamwork and guest speakers, to critically examine the field. Offers students an opportunity to learn to develop and test concepts that integrate social responsibility, sustainability, and mutual accountability into current financial and economic systems while expanding social capital markets.

ENTR 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENTR 4225. Corporate Entrepreneurship through Global Growth, Acquisitions, and Alliances. 4 Hours.
Analyzes whether, why, and how multibusiness corporations expand their operations into new business areas by questioning decisions to grow organically or through mechanisms such as acquisitions or alliances. Uses rigorous case-based discussions, expert readings, and major current events to discuss issues related to the choice of make, buy, or partner. Evaluates how these different corporate entrepreneurial strategies are used to help firms be more competitive and innovative.

ENTR 4501. Business Planning for Technology Ventures. 4 Hours.
Designed as a senior course for entrepreneurship majors. Covers the issues raised when creating a technology venture that goes through multiple rounds of financing in order to become a successful large company. Topics include managing growth, writing business plans, raising money, and formulating exit strategies. Focuses on projects to obtain venture financing from venture capitalists, angels, and corporate investors.

ENTR 4503. Business Planning for Small and Medium Enterprises. 4 Hours.
Designed for seniors interested in launching a new venture or growing an existing business venture. Includes developing a business plan, strategy development for small- to medium-sized enterprises, sales forecasting, pro-forma development, debt financing, and service developments. Sponsored by the Center for Family Business, the focus of projects is to obtain a bank loan to start a business or grow an existing small- to medium-sized venture.
ENTR 4505. Entrepreneurial Growth Strategy for Technology Ventures. 4 Hours.
Focusses on helping technology ventures define and improve their strategies and tactics to achieve external funding. Studies frameworks for developing a growth-focused product and service strategy; techniques to grow and evolve a startup team, creating scalable business models; and early stage, successive-round venture finance. Working in teams, students must apply these methods to improve the business plans for early stage technology ventures and to create new financial projections and investor packages for early stage ventures, with specific assessments of customer focus and needs, intellectual property, new product-line and technology strategy, and business model design. Company projects include the fields of web services, IT, healthcare, and life sciences. The course is a practicum on how to get new venture concepts funded and scaled from the perspective of entrepreneur and investor.

ENTR 4506. Advanced Studies in Social Enterprise. 4 Hours.
Focusses on a single developing region. Offers an opportunity to analyze the role of socially-driven entrepreneurship or “social impact enterprises” (SIEs) in alleviating poverty and its symptoms (for example, disease, illiteracy and chronic unemployment) in that country. To prepare for an intensive field experience working with local SIEs on one or more hands-on projects, students have an opportunity to study the history, politics, and development of the country, with an emphasis on the role that private-sector initiatives have played and hope to play in addressing widespread poverty and with a focus on the failures and successes in economic and business development, economic growth, and poverty alleviation. Offers students an opportunity to develop a plan for a micro-investment strategy focused on these and/or similar businesses and organizations having a significant social impact in a developing country. Includes an optional nine-day field component in a developing country during spring break; students who do not participate in the field component are given an alternative research assignment. ENTR 3210 and ENTR 3219 recommended.

ENTR 4510. Management Consulting Abroad. 4 Hours.
Offers an intensive field consulting program with local ventures in different countries. Designed to have students experience firsthand the challenges that entrepreneurs confront internationalizing products and services as well as core product management issues. Offers students an opportunity to work in cross-culture consulting teams with local students from partner universities. Projects vary widely but typically involve assessment of current product line and services strategy, marketing approaches, and how these must be adapted for foreign markets, including the United States. This is a field consulting course with heavy client engagement, requiring detailed written and oral communications for the client.

ENTR 4512. Social Entrepreneurship and Sustainable Development in India. 4 Hours.
Offers a Dialogue of Civilizations course in India focusing on a social entrepreneurial journey of researching and designing sustainable economic solutions to social problems. The overriding premise of the course is that the inception and implementation of a social innovation begins by understanding a social problem within a particular context and developing a systems-based approach to imagining solutions to reduce or solve the social problem. Through a learning-by-doing approach, offers students an opportunity to delve into critical social problems in the country—gender inequality, financial exclusion, climate vulnerability, environmental degradation, water access, disease, illiteracy, human trafficking, food insecurity, etc.—and work alongside local counterparts.

ENTR 4514. Development Practice and Global Citizenship in India. 4 Hours.
Offers a Dialogue of Civilizations course in India focusing on the personal, reflective journey of the individual and the collective journey of becoming an active global citizen. Offers students an opportunity to enter the personal journey by exploring development practice—what it means to have a life and career as a development practitioner—and by engaging in reflective practice, a set of techniques for synthesizing and analyzing our lived experience, both personal and professional. Also offers students an opportunity to engage in the global citizen journey by learning to facilitate dialogues between their class and their new colleagues and friends in India to better understand their hopes and fears about the globalized context in which we all live.

ENTR 4970. Junior/Senior Honors Project 1. 4 Hours.
Focusses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

ENTR 4971. Junior/Senior Honors Project 2. 4 Hours.
Focusses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

ENTR 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENTR 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

ENTR 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

ENTR 4993. Independent Study. 1-4 Hours.
Allows students who have received approval to undertake independent study in lieu of any course required in the various concentrations. Students present proposals to an Independent Studies Committee for evaluation and approval. Every proposal requires a detailed outline of the objectives and plan of study and must be accompanied by a supporting statement from the supervising faculty member under whose direction the study takes place. A copy of the final report prepared by the student is presented to the appropriate Independent Studies Committee. Further information about the Independent Studies Program can be obtained from concentration coordinators. May be repeated without limit.

ENTR 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

ENTR 5978. Independent Study. 1-4 Hours.
Allows students who have received approval to undertake independent study in lieu of any course required in the various concentrations. Students present proposals to an Independent Studies Committee for evaluation and approval. Every proposal requires a detailed outline of the objectives and plan of study and must be accompanied by a supporting statement from the supervising faculty member under whose direction the study takes place. A copy of the final report prepared by the student is presented to the appropriate Independent Studies Committee. Further information about the Independent Studies Program can be obtained from concentration coordinators. May be repeated without limit.
ENTR 6200. Enterprise Growth and Innovation. 3 Hours.
Explores the challenges and processes for harnessing technological
innovation for new-business development. Integrates technology
strategy, innovation in marketing, product development, and organization
design for the purpose of enterprise growth. Through readings,
cases, and exercises, studies how firms from different industries gain
competitive advantage through distinctive products and services, and
leverage their technologies and skills into new emerging markets. Also
focuses on processes for conceiving, financing, and organizing new
ventures.

ENTR 6208. Innovation and Enterprise Growth. 2,3 Hours.
Explores the challenges and processes for harnessing technological
innovation for corporate growth. Integrates innovation in four key
dimensions: markets and users, technology (for both products and
services), organization, and business models. Uses readings, cases,
and exercises to teach students how firms from different industries
accelerate corporate growth by internally generating new products
and services and how to do this fast and efficiently by leveraging their
skills, product technologies, and production processes into growth
opportunities. Features a team-based applied project in corporate
entrepreneurship. Offers students an opportunity to develop fully featured
business plans using business planning tools from BUSN 6202. Focuses
on growth through internal development, as opposed to mergers and
acquisitions.

ENTR 6210. Managing Operations in Early Stage Ventures. 3 Hours.
Stresses the operating problems of managing small businesses. Case
studies develop analytical approaches for appraising the risks and
rewards of potential growth opportunities as well as operating problems.
Problems range from locating, evaluating, marketing, and financing
a small company to the survival and growth of more established
businesses. Guest speakers and entrepreneurs provide pertinent
business perspectives to in-class activities.

ENTR 6211. Entrepreneurship: Services and Retail Business Creation. 3
Hours.
Covers the issues surrounding the creation of a new business in the
service and retail sectors. Emphasizes issues relating to the startup,
growth, and operation of business ventures in these areas. Topics
include developing a business plan for startup, market positioning,
services design, operations management, sales forecasting, cash flow
management, and venture financing with a heavy emphasis on debt
financing. Students are asked to develop business plans for services and
retail ventures of their own choosing as the class project. Requires prior
completion of 9 SH of MBA core courses.

ENTR 6212. Business Planning for New Ventures. 3 Hours.
Gives students the opportunity to build a complete business plan for
new high-potential ventures. Covers all aspects of the planning process,
from the point of view of both the prospective entrepreneur and the
potential investor. Explores the demands of the entrepreneurial career
through reading, self-assessment exercises, and group projects. Guest
speakers from startup companies, law firms, and venture capital firms
provide a window on current experiences in the small-business world.
Recommended for prospective entrepreneurs as well as others who may
become involved with new ventures.

ENTR 6214. Social Enterprise. 3 Hours.
Designed to provide students with an in-depth exposure to
entrepreneurship in the social sector, a rapidly growing segment of the
global economy. Uses the case method to expose students to leading
entrepreneurs who have developed and implemented business models
to solve social problems such as extreme poverty, disease, illiteracy, and
economic and social dislocation. Focuses on uniquely creative and driven
people who have dedicated their lives to making a difference in the lives
of others through values-based entrepreneurship.

ENTR 6215. New Venture Creation for Entrepreneurs and Corporate
Innovators. 3 Hours.
Offers a methods-based course for innovators seeking to become
entrepreneurs, either in their own businesses or leading a new venture
within an existing corporation. Offers students an opportunity to apply
methods for opportunity identification, customer segmentation, user-
centered design, business modeling, and field-testing new venture
concepts. From this foundation, students create detailed financial
projections, written business plans, and investor presentations.

ENTR 6216. Global Social Entrepreneurship and Innovation. 3 Hours.
Explores using innovation to build and create value in the larger global
context. Examines some of the latest innovation practices: (1) to build
and create value within emerging economies, (2) to facilitate social
entrepreneurship, (3) to promote sustainable development, and (4) to
build and create value at the bottom of the pyramid. Exposes students
to what successful entrepreneurs must learn to balance business
demands with the larger need for innovative thinking. Stresses the
application of successful practices to generate results. Topics include
creating and sharing knowledge and intellectual property, exploiting
systems and networks, redefining disruptive innovation, and the steps
necessary to make innovation and entrepreneurship happen in a variety
of global contexts. Uses real-life examples and case studies to illustrate
successful practices.

ENTR 6217. Lean Innovation. 3 Hours.
Explores how corporate venturing and entrepreneurial teams can quickly
and effectively bring new concepts to market. Demonstrates how small
technical teams can quickly investigate opportunity spaces, develop
and select concepts, and translate these into prototypes. Other topics
include industrial design thinking, project teams, prototyping, and
commercialization of design. Explores the challenges and solutions to
managing a technology-based product within an established corporation
and details frameworks on how innovative projects can be inexpensively
tested and deployed within the organization.

ENTR 6218. Business Model Design and Innovation. 3 Hours.
Introduces major topics in the modern understanding of business
models: their essence and role in securing competitive advantage, key
components and design of business models, business model change and
innovation, technology commercialization through sustaining business
models, financial representation of a business model, and validation of
developed business models.

ENTR 6219. Financing Ventures from Early Stage to Exit. 3 Hours.
Introduces students to the financing process for ventures from early
stage to exit. Exposes students to various financing options, which may
include crowdsourcing, the American JOBS Act, and foreign-sourced
capital, as well as different types of debt and equity financing. Offers
students an opportunity to learn about analyzing financial aspects of
term sheets, including valuation methodologies and other financing
documents.
ENTR 6220. Family Business Leadership and Governance. 3 Hours.
Explores the unique challenges and strengths of family firms. Uses a learning framework with particular emphasis upon the insights and lessons learned by successful family business leaders. Offers students an opportunity to heighten their awareness of themselves concerning their roles in the family firm and their future career plans, as well as to develop key leadership skills associated with strategic planning and implantation within family enterprises. Explores particular functional issues unique to family firms in the areas of marketing, finance, control and human resource management, as well as family and business governance. Restricted to business students only.

ENTR 6221. Managing Creativity for Entrepreneurs. 3 Hours.
Introduces students to design thinking, offering them an opportunity to learn to think creatively in designing new products or services in order to start companies—and not just for incremental change but for game-changing, disruptive innovation. Covers idea generation, creative design, opportunity assessment, and selling ideas to investors. The course is activity based, guiding students through the steps of generating ideas and turning them into prototypes. At the conclusion of the course, offers students an opportunity to present their business ideas to angel investors.

ENTR 6222. Competing in Dynamic, Innovation-Driven Markets. 3 Hours.
Reviews the key theories and tools needed to understand how technological change creates new markets and prompts new business models, how technology-based firms can outcompete rivals in fast-growing markets characterized by high uncertainty, and how the evolution of technology in an industry affects the type of firm capabilities needed to succeed over time.

ENTR 6223. Cross-Cultural Innovation Management. 3 Hours.
Introduces students to the meaning of innovation. Offers students an opportunity to build their knowledge and skills in enhancing innovation across cultures, to obtain tools for managing innovation and for creating an innovation culture, and to implement measures of innovation. Walks students through each one of the innovation phases, from problem identification and idea generation to manufacturing and market penetration. Consists of hands-on experiential exercises focused on the management of innovation.

ENTR 6224. Intellectual Property and Other Legal Aspects of Business and Innovation. 3 Hours.
Introduces the major areas of the legal environment for innovation and new ventures and their relationship to early stage decisions and product and business development. Analyzes the nature, practical impact, and competitive usefulness of laws in the areas of intellectual property, contracts, employment, e-commerce, regulatory compliance, and entity formation. Offers students an opportunity to integrate and apply their understanding of legal, financial, business, technology, and ethical factors; sharpen their analytic skills; and use their skills and understanding to recognize opportunities for adding value and managing risk.

ENTR 6225. Corporate Entrepreneurship through Global Growth, Acquisitions, and Alliances. 3 Hours.
Offers students an opportunity to analyze whether, why, and how multibusiness corporations expand their operations into new business areas by questioning decisions to grow globally through mechanisms such as acquisitions or alliances. Uses rigorous case-based discussions, expert readings, and major current events to discuss issues related to the choice of make, buy, or partner. Offers students an opportunity to evaluate how these different corporate entrepreneurial strategies are used to help firms be more competitive and innovative.

ENTR 6260. Advanced Topics in Entrepreneurship. 3 Hours.
Offers an in-depth examination of selected issues and problems in entrepreneurship that are of current interest to faculty and students. Specific topics alternate depending on faculty availability and interest as well as student enrollment criteria.

ENTR 6290. Developing New Ventures for Startups and Corporations. 2 Hours.
Focuses on the venturing process, specifically how innovative ideas are identified and translated into successful results. Introduces methods for assessing the attractiveness of new ideas and issues involved in the formation of successful venture teams. Offers students an opportunity to learn how to develop a business plan, including how to do research and analysis for each section and how to integrate the entire plan for the best result. Also introduces venture concept validation, business model validation, venture funding types and stages, venture financial performance projections, and the foundations of a great pitch.

ENTR 6293. Design Thinking for Market-Driven Innovation. 3 Hours.
Uses digital mashups, iterative design, and “play” to unlock creative potential in the way products and services work for customers. Based on the principle that innovation is a discipline that is capable of being learned and being practiced and that arts-based learning and design thinking can unlock creative potential and foster an environment that encourages innovation. A team-based group project applies the principles of iterative design introduced in this course.

ENTR 6960. Exam Preparation—Master’s. 0 Hours.
Offers the student the opportunity to prepare for the master’s qualifying exam under faculty supervision.

ENTR 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENTR 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

ENTR 7976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

TECE 6200. Innovation and Entrepreneurial Growth. 3 Hours.
Covers the intersection of the innovation management and entrepreneurship literature. Topics include a review of the innovation literature; use of technology as a competitive tool; developing focused growth strategies; architectures and platforms for products, systems, and services; and the interplay of technology markets and organizations. The course is not only theoretical but also practical in that it covers trends in specific technology fields. Open to first-year graduate students.

TECE 6222. Emerging and Disruptive Technologies. 3 Hours.
Covers the role emerging technologies play in innovation for new ventures and established corporations. Includes a mix of theory and practical knowledge. Topics covered include technology disruption, diffusion, life cycles, and research-and-development strategy. Explores, in detail, the technical and market opportunities for current and emerging technologies across a broad spectrum of industries.

TECE 6230. Entrepreneurial Marketing and Selling. 3 Hours.
Examines the specific situation of entrepreneurial marketing. Topics include how to perform a market analysis when there are limited resources and tight schedules to be met. Also addresses new market situations, opportunity assessment, customer segmentation, going to market, and writing a marketing plan.
TECE 6240. Finance For Technology-Based Entrepreneurial Firms. 3 Hours.
Examines the special issues of finance in a technology-based entrepreneurial firm. Special situations arise because of the length of time a startup firm is in the research-and-development stage; the firm may require years before any revenue is generated. Introduces students to cash flow analysis, budgeting, raising money, banking, exit strategies, pro formas, and writing a financial plan.

TECE 6250. Lean Design and Development. 3 Hours.
Covers the intersection of customer research with product design, specifically lean design and how to map abstract attributes that customers seek into concrete product designs that can actually be built. Other topics include managing the technology business interface, creating product teams, and drafting product development plans. Open to first-year graduate students.

TECE 6260. Measuring and Managing the Cost of Production and Growth. 3 Hours.
Examines the new and growing topic of accounting for new product development and its influence on project selection, product design, and profitability. Topics include managerial and financial accounting, accounting for new product development, project costs, and business data.

TECE 6300. Managing a Technology-Based Business. 3 Hours.
Covers topics specific to managing a business or a strategic business unit within a firm. Considers the special issues related to technology-based firms. Topics include creating a culture, operations planning, staffing for technical excellence, dealing with technology vendors, dealing with advisers, supply chain management, and writing operations plans. Open to first-year graduate students.

TECE 6320. International Business and Intellectual Property. 3 Hours.
Covers two topics that are very important to technological entrepreneurs: selling products and services internationally and protecting one's intellectual property globally. Topics include targeting and selling abroad, agencies for small business export, differences in operating abroad, forming international alliances, and protecting intellectual property in the international marketplace.

TECE 6321. Intellectual Property in an Entrepreneurial Firm. 2 Hours.
Covers the subject of intellectual property as it applies to the new entrepreneurial firm. Topics covered include patents, trademarks, trade secrets, and intellectual property law. Explores the role that intellectual property plays in developing business strategies.

TECE 6340. The Technical Entrepreneur as Leader. 3 Hours.
Focuses on the personal skills an entrepreneur needs to lead and persuade others. Students read about and complete exercises on leadership and selling ideas. In addition, students meet members of the entrepreneurship community in New England. Stresses communications skills, both written and oral, along with self-discovery of leadership style.

TECE 6360. Strategic Entrepreneurship in a Technical Field. 3 Hours.
Explores various aspects of developing a business plan to a professional level. Students write a business plan for a product or service idea and present the plan to a jury.

TECE 6374. Special Topics. 1-4 Hours.
Examines state-of-the-art topics that are of interest to the faculty member presenting the lectures. Open to first-year graduate students. May be repeated without limit.

TECE 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

TECE 7671. Development Project. 2 Hours.
Constitutes the first phase of the capstone project. Students select or are assigned to a project. The initial work involves the development of a needs and requirements statement for their project. Incorporates all of the literature search and groundwork for the larger capstone. Requires acceptance into the MS in Technological Entrepreneurship program. May be repeated up to five times.

TECE 7673. Development Project in Entrepreneurship. 3 Hours.
Requires students, working with an adviser to develop the initial phase of the project, to test concepts and build prototypes of the product/technology they plan on developing for their business. An important component of the course is the requirement that students develop a proof of concept to present to potential investors. May be repeated without limit.

TECE 7976. Directed Study. 1-4 Hours.
Offers theoretical or experimental work under the direction of faculty on a selected topic. Course content depends upon the faculty member. May be repeated without limit.

TECE 7978. Independent Study. 1-4 Hours.
Offers work performed under individual faculty supervision. May be repeated without limit.

Environmental Studies (ENVS)

ENVS 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENVS 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENVS 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENVS 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student's major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8-credit honors project. May be repeated without limit.

ENVS 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student's major field. May be repeated without limit.

ENVS 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

ENVS 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision.

ENVS 4992. Directed Study. 1-4 Hours.
Offers students an opportunity for special readings and research in environmental studies. May be repeated without limit.

ENVS 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor.

ENVS 4996. Experiential Education Directed Study. 4 Hours.
Draws upon the student's approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using it to fulfill their experiential education requirement. May be repeated without limit.
FIN 0400. AFP Learning System: Treasury. 3 Hours.

Designed for individuals who want to broaden their knowledge and skills in the area of corporate treasury and cash management and financial professionals who want to prepare for the AFP’s Certified Treasury exam. Topics include utilizing corporate cash; maintaining a company’s ability to meet current and future financial obligations; establishing systems that provide adequate liquidity, optimizing “cash conversion cycles,” and “float”; assisting in obtaining short- and long-term borrowed funds; using credit facilities; utilizing technology to streamline the cash management process; building domestic and international banking relationships to support global cash management; understanding a company’s internal policies/processes and external variables that impact cash management. Offers access to Web-based testing with over 400 test questions and real-life interactive applications.

FIN 0401. AFP Learning System: Treasury. 3.6 Hours.

Offers students an opportunity to achieve a greater mastery of the knowledge required to address current and emerging corporate financial issues. Appropriate for practitioners executing finance, accounting, or treasury functions; bankers and other financial services providers developing and implementing products and services for use by corporate finance organizations; technical and administrative staff supporting finance functions; and students preparing for the AFP’s Certified Treasury Professional certification exam. Uses an interactive learning experience where students engage in classroom discussion and continue learning at home using Web-based tests and application exercises. Includes more than 600 online questions in the format found on the actual CTP exam, pretest covering all modules, module-specific tests with automatic feedback, comprehensive posttests, and progress reports.

FIN 0701. CFP 1 Financial Planning Process and Insurance. 3 Hours.

Presents the basics that form the foundation of knowledge needed as a working financial service professional.

FIN 0702. CFP 2 Investment Planning. 3 Hours.

Offers students an opportunity to learn about the wide variety of investment vehicles that can be included in a client’s portfolio, as well as client assessment, tax considerations, economic factors, valuation methods, asset allocation techniques, portfolio performance evaluation, and more.

FIN 0703. CFP 3 Income Tax Planning. 3 Hours.

Emphasizes the fundamentals of individual income taxation, the tax implications of various types of businesses, tax-advantaged investments, employee compensation issues and planning, alternative minimum tax, tax traps, and more.

FIN 0704. CFP 4 Retirement Planning and Employee Benefits. 3 Hours.

Covers all the major retirement-related issues—retirement savings needs analysis, qualified retirement plan design, Social Security, Medicare, and more. Examines group life, health, and disability insurance; nonqualified deferred compensation; and other commonly provided employee benefits.

FIN 0705. CFP 5 Estate Planning. 3 Hours.

Introduces the process of developing an estate plan. Topics covered include federal estate and gift taxation, techniques that reduce the size of the gross estate, wills, intestacy, probate, trusts, and more.

FIN 0712. CFP Certification Exam Review. 4.8 Hours.

Utilizes experienced financial planning practitioners who focus on areas of greatest importance and difficulty. Because this is an intensive review, participants are expected to have already successfully completed a CFP Board Registered Certification Education Program or have exam challenge status through other qualifications and have an in-depth understanding of the five course areas. For a full description of challenge status qualifications please visit www.CFP.net. Participants must also be proficient using a financial calculator acceptable to the CFP Board for the examination. Northeastern University has partnered with the College for Financial Planning to use its course materials for this review course.

FIN 1200. Managing Your Personal Finances. 3 Hours.

Introduces the basic theory, techniques, and application of financial analysis tools needed for business financial administration and decision making.

FIN 3310. Financial Institutions and Markets. 3 Hours.

Explores the structure and functioning of the U.S. and international financial markets and institutions. Topics covered include banking theory; instruments of various financial markets; the roles of traditional and nontraditional financial intermediaries; and the impact of securitization, international financial competition, financial system stability, and financial regulation.

FIN 3330. Risk Management and Insurance. 3 Hours.

Offers students an opportunity to develop an understanding and appreciation of fundamental insurance principles. Studies risk, risk management, rating, and contract elements. Course material includes the major lines of insurance covering both personal and commercial insurance.
FIN 3340. Investments. 3 Hours.
Studies the nature of securities, the mechanics and costs of trading, and the ways in which the securities markets operate. Applies risk-return analysis in making decisions to buy or sell stocks, bonds, options, and other investments. Requires a semester-long project in which students follow and analyze the performance of individual and a portfolio of investments with written analysis.

FIN 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FIN 4220. Working Capital Management. 3 Hours.
Explores short-term financial management. Reviews institutional and legal aspects as a context for making decisions involving current assets and current liabilities. This working capital management—the management of cash, inventories, accounts receivable, and short-term credit arrangements by business firms—provides the basis of long-term survival of businesses.

FIN 4230. International Finance. 3 Hours.
Studies the international financial environment in which organizations operate, including trade, balance of payments, capital flows, tariff policies, international economic institutions, currency, and exchange-rate issues. Explores international aspects of investment planning and financing decisions and other factors important to managing multicity cash flows and financing of multinational corporations.

FIN 4240. Personal Financial Planning. 3 Hours.
Focuses on the logic, concepts, tools, and applications of financial planning for retirement, estate planning, and financial risk management. Forecasts and analyzes various financial needs such as retirement income, health and insurance protection, dependent protection projections, etc., and utilizes investment vehicles to develop a financial plan to meet the forecast needs. Intended for those planning careers in personal financial advising in one of the various financial services environments.

FIN 4250. Real Estate Finance. 3 Hours.
Discusses finance concepts applied to real estate issues. Topics include mortgage instruments, mortgage markets, residential real estate closing, income property analysis, financial leverage, real estate valuation, securitization, and real estate investments.

FIN 4950. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

FIN 4955. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student's major field. May be repeated without limit.

FIN 4983. Topics. 1-4 Hours.
Covers special topics in finance. May be repeated without limit.

FIN 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FIN 4991. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

FIN 4992. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

FIN 4993. Independent Study. 1-4 Hours.
Offers students an opportunity to undertake special research.

FIN 4994. Internship. 1-4 Hours.
Provides students with an opportunity for internship work.

FIN 4995. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

FIN 4996. Experiential Education Directed Study. 1-4 Hours.
Draws upon the student's approved experiential activity and integrates it with study in the academic major.

FIN 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

FIN 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

FIN 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

FIN 6101. Accounting Fundamentals for Financial Institutions. 3,4 Hours.
Emphasizes managerial and financial accounting concepts as they apply to financial institutions. Analyzes financial statements of a variety of financial institutions with an emphasis on understanding the accounting structure of financial institutions, ratio analysis as it is used to evaluate financial performance, and accounting control systems.

FIN 6102. Asset and Liability Management. 3,4 Hours.
Provides a risk-management analysis of the assets and liabilities of financial institutions. Topics include analysis and management of regulatory, liquidity, capital, credit, currency, and interest-rate risks.

FIN 6120. Building Financial Relationships. 3,4 Hours.
Explores how financial institutions develop, price, and market financial products and services in a global economy. Examines the variety of financial products available, product packaging and pricing decisions, cross-selling, and relationship building in a competitive marketplace.

FIN 6160. Financial Institutions and Markets. 4 Hours.
Introduces the domestic and international financial system and the institutions within it. Topics include the major types of financial institutions that operate globally and the financial instruments they use; determination of exchange rates, interest rates, and security prices and their impact on markets; and the impact of fiscal and monetary policies on financial markets and the broader economy.

FIN 6161. Investment Analysis. 4 Hours.
Focuses on investment management as the study of risk and return of financial securities and real assets. Explores domestic and international financial markets and the securities traded therein. Offers students an opportunity to develop an understanding of security analysis, including fundamental, technical, and quantitative techniques used in the valuation of financial assets. Analyzes qualitative concepts such as market efficiency, intrinsic value, and risk. Stresses portfolio construction, management, and protection.

FIN 6961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

FIN 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FIN 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

FIN 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.
FIN 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

FIN 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

FIN 6983. Topics. 1-4 Hours.
Covers special topics in finance. May be repeated without limit.

FIN 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

Finance and Insurance (FINA)

FINA 1209. Personal Finance. 4 Hours.
Emphasizes the development of individually focused financial information and a comprehensive financial plan designed to enable the individual to manage his or her financial affairs. Integrates personal goals—such as buying a home, retirement, investing, and insurance needs—to help assure that the financial plan incorporates the major decision stages of an individual's faces.

FINA 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FINA 2201. Financial Management. 4 Hours.
Designed to develop the financial skills and logical thought processes necessary to understand and discuss financial policy decisions in a global economy. Specific objectives include developing an understanding of the time value of money, using financial statements in decision making; and understanding the nature of financial markets, the cost of capital, valuation of stocks and bonds, management of short-term assets, short-term and long-term financing, capital markets, and multinational financial management. Addresses the impact of legal, social, technological, and ethical considerations on efficient economic outcomes. Requires a financial calculator and provides an opportunity to develop computer spreadsheet skills.

FINA 2202. Financial Management in a Global Context. 4 Hours.
Covers the financial skills and thought processes necessary to understand and discuss financial policy decisions in a global economy. Emphasizes return and risk management issues faced by financial managers as they operate internationally. Topics include the effects of currency translation and valuation; understanding the time value of money; translating, consolidating, and evaluating financial statements in decision making; determination of the cost of capital; valuing stocks and bonds available in different global markets; and managing short-term assets and liabilities and short-term financing. Addresses the impact of legal, social, technological, and ethical considerations faced by financial managers in companies that operate globally. Requires a financial calculator. Offers students an opportunity to develop computer spreadsheet skills.

FINA 2209. Financial Management. 4 Hours.
Does not count as credit for business majors. Counts as FINA 2201 for business minors only.

FINA 2720. Sustainability in the Business Environment. 4 Hours.
Examines a variety of environmental problems, including global warming, use and disposal of toxic substances, and depletion of natural resources such as water and petroleum. Many of these problems arise because these are resources that are available to all and so their overuse is an externality that is not included in manufacturing costs. Businesses have been involved in both identifying sustainability issues in their individual organizations and providing a variety of innovative solutions. Uses a combination of readings and case studies to assess how both government regulations—such as taxes, subsidies, building codes, prohibitions of use—and business solutions—including zero emissions, green design, producer take-back, life cycle assessment, and corporate environmental reporting—address these problems.

FINA 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FINA 3301. Corporate Finance. 4 Hours.
Designed to develop the skills needed to make and implement financial policy decisions in a global economy. Specific objectives include developing an understanding of financial analysis; company valuation; capital markets; cost of capital; capital asset pricing and risk management; short- and long-term financial policies; working capital management; multinational financial management; and special topics including lease financing, debt refunding, mergers and acquisitions, and bankruptcy and restructuring. Offers opportunities to consider many broader issues including the relevance of globalization; the world economy; technological advances; and legal, social, and ethical issues related to the practice of corporate finance. Stresses written and oral communication skills and teamwork. Uses cases and spreadsheets extensively.

FINA 3303. Investments. 4 Hours.
Focuses on investment management as the study of risk and return of financial securities and real assets. Students design and assess models that evaluate investments while recognizing the constraints of the real world. Explores domestic and international financial markets and the securities traded therein. Discusses techniques for valuation of financial assets. Analyzes qualitative concepts such as market efficiency, intrinsic value, and risk. Provides the ability to build unique valuation models to suit the particular investment alternative that students wish to scrutinize. Also stresses portfolio construction, management, and protection, as well as performance assessment. During the semester, students have an opportunity to create and manage a stock portfolio.

FINA 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FINA 4310. Working Capital Management. 4 Hours.
Examines strategies and analytical approaches to managing current assets and current liabilities. Explores corporate cash management under changing money market conditions. Discusses the use of interest rate futures and working capital management in a multinational context. Provides a summary overview of entrepreneurial finance, with a focus on small businesses, corporate ventures, and intrapreneurship. Applies knowledge of corporate finance in the context of starting, acquiring, managing, and divesting a business or a business unit within a corporation. Topics include analyzing the financial needs of new ventures, exploring sources of financing, managing decline, determining valuation, and reviewing exit strategies.
FINA 4312. Issues in Corporate Governance. 4 Hours.
Examines the nature of conflicts over control of the corporation. Applies modern financial theory and practice to the issues raised and draws on seminal works in the finance and economics literature that influence the current debate in this area. Discusses legal and ethical considerations that are especially important in corporate-control issues. Uses cases involving well-known takeovers, as well as current hostile takeover battles, to illustrate the theories discussed.

FINA 4320. International Financial Management. 4 Hours.
Introduces international financial markets including balance of payments, history of the international monetary system, exchange-rate determination, foreign-exchange-exposure hedging strategies, and international capital markets. Examines how the financial strategies and policies of multinational corporations differ from domestic corporations and how financial management is utilized in an international setting to achieve corporate goals.

FINA 4410. Valuation and Value Creation. 4 Hours.
Explores recent developments in financial management and financial analysis through the use of modern financial theory to make capital allocation decisions that lead to long-run value maximization for the corporation. Focuses on applications and financial model building. Examines risk analysis by building spreadsheet models for valuation and risk-analysis applications. Utilizes valuation analysis models to merge financial, corporate, and business strategies to measure and manage corporate value. Develops an understanding of the mechanics of the valuation process, along with an understanding of the drivers of value and development of strategies for value creation. Topics covered are relevant to value consultants, corporate managers, and securities analysts.

FINA 4412. Personal Financial Planning. 4 Hours.
Emphasizes the development of personal financial management knowledge by applying the techniques and perspectives of financial planning professionals. Builds upon and applies skills gained in FINA 2201 to personal finance decisions such as retirement planning, home mortgages, and overall risk management. Offers students an opportunity to develop their own financial plan and understand how that plan will change as they age and their life situation changes. Note that while this course is not designed to prepare students to take the Certified Financial Planner exam, many of the topics, such as retirement planning, investment and securities planning, and estate planning, are among those discussed.

FINA 4420. Mergers and Acquisitions. 4 Hours.
Offers a practical, planning-based approach to managing the mergers and acquisitions (M&A) process. Analyzes how M&As create or destroy value; commonly used takeover tactics and defenses; M&A valuation techniques; alternative deal structures; and the financial, strategic, legal, and regulatory aspects of M&As. The first section covers how and when to apply the appropriate tools and skills to successfully complete a transaction. The second section offers students an opportunity to apply what has been learned to solve real-world business problems. Discusses all major elements of the acquisition process in the context of a logical process.

FINA 4512. Financial Risk Management. 4 Hours.
Explores the concepts of financial futures, options on financial futures, and listed options markets as developed to help corporations and financial institutions manage financial risk. Covers financial derivatives and standard hedging techniques first, followed by a study of market risk and strategies in managing market risk.

FINA 4514. Investment Banking. 4 Hours.
Examines the investment banking business. Investment bankers are one of the most important conduits through which funds flow from savers to corporations needing to invest in plant and equipment. Offers an opportunity to examine the major functions of large investment banks in regard to their investment banking, market making, and asset management businesses; to determine the financing needs of domestic and international corporations, not-for-profit organizations, and government entities by using concepts learned in earlier courses; and to learn to link these financing needs with products that are available in the capital markets, usually through the investment banking houses.

FINA 4516. Real Estate Finance. 4 Hours.
Surveys the field of real estate including principles of real estate law, transactions brokerage, management, development, valuation, taxation, finance, and investment. Provides a framework of real estate finance and investment, in both theory and practice. Examines all aspects of real estate financing including the primary and secondary mortgage markets, real estate financial institutions, regulations, and mortgage-backed securities. Analyzes the return, risk, and various strategies in real estate investments with financial methods and techniques. Uses case discussions, spreadsheet analysis, and investment projects to make learning effective.

FINA 4518. Risk Management and Insurance. 4 Hours.
Emphasizes the functional area of corporate risk management. Covers such areas as organizing and controlling the risk management function; identifying, measuring, controlling, and financing risk; selecting the best method of risk treatment; and implementing and monitoring risk management. Topics of exposure analysis include property, liability (public, employer, products, officers and directors, and professionals), income, and extraordinary expense losses. Covers treatment methods such as self-insurance, offshore captive, retention groups, and commercial insurance. Includes recent developments such as tort reform integration of risk management with modern financial theory, as well as implications and analysis of recent tax reforms.

FINA 4524. Credit Analysis. 4 Hours.
Explores all aspects of credit evaluation from the perspective of banks and other institutions. Introduces industry-grade credit analysis. Credit analysis is used by all manner of banks and other institutions, such as insurance companies, hedge funds, private equity groups, and even elements of local, state, and federal governments, to evaluate clients and potential borrowers who need loans and other structured debt products.

FINA 4526. Core Topics in Alternative Investments. 4 Hours.
Covers alternative investments, including real assets such as real estate and real estate investment trusts, hedge funds, commodities, private equity, and structured products. This course is highly quantitative and focuses on methods for understanding risk, return, and benchmarking of these investments. Offers students an opportunity to obtain a deeper understanding of each of these asset types.

FINA 4602. Turnaround Management. 4 Hours.
Examines strategies for identifying companies likely to fail and selecting and implementing remedial actions. Topics include business turnarounds, troubled companies, workouts, bankruptcies, and liquidations, using case studies and readings. Students evaluate a turnaround plan.
FINA 4604. Fixed-Income Securities. 4 Hours.
Exposes students to the theory, application, and evidence concerning highly sensitive interest rate products. Explores recent developments in pension fund management, asset/liability management, duration matching, “gap” management, and other important issues confronting domestic and international financial and corporate management. Offers students the opportunity to learn how to customize a risk management program.

FINA 4608. Advanced Financial Strategy. 4 Hours.
Covers strategic financial decision making in dynamic and technology-driven organizations operating in domestic and international settings. Through case studies, discussions with senior financial executives, and student projects, students gain insight into capital investing and financing decisions in the new economy. An analytical paradigm linking business strategy, financial management, and valuation is utilized to explore financial decision making throughout the life cycle of companies, intended to optimize shareholder value creation. Topics include fundamental financial analysis, capital budgeting under conditions of high risk and uncertainty, startup financing, creative financing, megamergers, risk management, and valuation.

FINA 4610. Entrepreneurial Finance, Innovation Valuation, and Private Equity. 4 Hours.
Covers qualitative and quantitative aspects of entrepreneurial finance, such as venture capital and angel financing. Also covers private equity (i.e., buyout/leveraged-buyout firms), but in less detail. Introduces valuation in entrepreneurial finance, including valuation of startups, using real options to value innovation-intensive firms, valuation in staged financing, etc. Casework emphasizes the practical aspects of qualitative and quantitative issues related to venture capital financing, entrepreneurship, and innovation from the perspective of the financier and the startup firm. Discusses issues related to the venture capital industry, such as the limited partnership structure, term-sheets and contracts, exit of portfolio firms, and international investments. Requires a working knowledge of Excel or other spreadsheet programs.

FINA 4970. Junior/Senior Honors Project 1. 4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. Combined with Junior/Senior Project 2 or college-defined equivalent for 8 credit honors project. May be repeated without limit.

FINA 4971. Junior/Senior Honors Project 2. 4 Hours.
Focuses on second semester of in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

FINA 4983. Special Topics in Finance. 4 Hours.
Examines areas of current interest and special topics in finance. Employs a mix of lectures, cases, and projects. Topics depend on the instructor. May be repeated up to two times.

FINA 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FINA 4993. Independent Study. 1-4 Hours.
Allows students who have received approval to undertake independent study in lieu of any course required in the various concentrations. Students present proposals to an Independent Studies Committee for evaluation and approval. Every proposal requires a detailed outline of the objectives and plan of study and must be accompanied by a supporting statement from the supervising faculty member under whose direction the study takes place. A copy of the final report prepared by the student is presented to the appropriate Independent Studies Committee. Further information about the Independent Studies Program can be obtained from concentration coordinators. May be repeated without limit.

FINA 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

FINA 5978. Independent Study. 1-4 Hours.
Allows students who have received approval to undertake independent study in lieu of any course required in the various concentrations. Students present proposals to an Independent Studies Committee for evaluation and approval. Every proposal requires a detailed outline of the objectives and plan of study and must be accompanied by a supporting statement from the supervising faculty member under whose direction the study takes place. A copy of the final report prepared by the student is presented to the appropriate Independent Studies Committee. Further information about the Independent Studies Program can be obtained from concentration coordinators. May be repeated without limit.

FINA 6200. Value Creation through Financial Decision Making. 3 Hours.
Highlights the role of financial management as a source of value creation in a competitive global environment characterized by rapid technological, personal, and market changes. Offers students an opportunity to develop tools and techniques of financial analysis and valuation to support financial decision making. Presents future managers with actual business problems to learn to apply the tools of financial analysis to strategic decisions faced by the firm, such as capital budgeting and capital structure.

FINA 6201. Financial Theory and Policy. 3 Hours.
Covers the fundamentals of financial decision making. Introduces students to the basic framework of corporate finance. Topics include tools and applications of financial asset valuations, the risk-return tradeoff, modern portfolio theory, methods of calculating the risk of financial assets, tools and applications for analyzing a firm’s capital investment decisions, capital structure and dividend policy issues, theory and evidence concerning corporate restructuring, such as mergers and hostile takeovers, and issues concerning international financial management and the legal, ethical, and regulatory environment of financial management.

FINA 6202. Analysis of Financial Institutions and Markets. 3 Hours.
Introduces the domestic and international financial system and the institutions within it. Develops data and quantitative analysis tools utilized for economic and financial modeling and analysis. Emphasis is on regression analysis and its application, including how to build and interpret statistical models. Topics include the major types of financial institutions that operate within the global economy and the financial instruments employed by them; how exchange rates, interest rates, and security prices are determined and how they affect the global economy; and how governments and central banks impact economic and financial conditions.
FINA 6203. Investment Analysis. 3 Hours.
Familiarizes students with domestic and international financial markets and the securities traded therein. Discusses a variety of techniques for valuation of financial assets and relies heavily on quantitative methods. Critically analyzes such qualitative concepts as market efficiency, intrinsic value, and risk. The contents of this course, descriptive, theoretical, and applied, should provide students with the ability to build unique valuation models to suit the particular investment alternative they wish to scrutinize. Also provides students with an understanding of how investment theory and investment practice relate.

FINA 6204. International Finance Management. 3 Hours.
Develops specific concepts, policies, and techniques for the financial management of the multinational firm. Topics include operation of the foreign exchange markets, foreign exchange risk management, sources and instruments of international financing, foreign direct investment and the management of political risk, multinational capital budgeting, and financing control systems for the multinational firm.

FINA 6205. Financial Strategy. 3 Hours.
Develops financial, analytical, and communication skills necessary to develop and implement a financial strategy consistent with firm value creation in a dynamic environment. Stresses the impact of ethical and legal considerations, global markets, and technological innovation on efficient economic outcomes. Emphasizes written and oral communication skills. Upon completion of this course, students should be able to identify and analyze a firm’s strategic opportunities and propose a suitable financial strategy that is consistent with firm value creation.

FINA 6206. Finance Seminar. 3 Hours.
Structures discussion of current topics in the finance literature. Students read and present the works of leading researchers. Topics are broad and may cover various areas of corporate finance, investments, and institutions. Students also complete an original project emphasizing current methodologies of analysis.

FINA 6208. Financial Management for Value Creation. 4 Hours.
Introduces basic concepts of financial management—the management of the flow of funds available to an organization. Uses practice-oriented education to help students develop knowledge, skills, critical-thinking abilities, and behaviors consistent with the objective of creating value. Includes frameworks, principles, tools, techniques, and procedures to illustrate their application. Topics include financial analysis, forecasting and planning, working capital management, valuation, capital budgeting, cost of capital, dividend policy, mergers, sources and methods of financing, financial structure, financial markets, financial strategy, risk management, and the timing of financial policies in domestic and international settings. Discusses ethical, legal, regulatory, environmental, societal, cultural, diversity, technological, and demographic issues related to financial management as appropriate.

FINA 6209. Introduction to International Accounting and Finance. 3 Hours.
Offers students an opportunity to obtain a graduate-level understanding of accounting principles and standards and resulting financial statements. Emphasizes problems caused from differences in accounting standards and tax codes. Traces the impact of exchange-rate changes on the reporting of profits and owner’s equity.

FINA 6211. Financial Risk Management. 3 Hours.
Provides an overview of all of the hedging markets and hedging instruments. Explores specific hedging use of options, forwards, futures, swaps, and options on futures. Focuses on advanced financial risk management of interest rates, currency rates, equity returns, and fixed income returns. Students use readings and case problems to study when and how to use hedging instruments to alter a portfolio’s risk exposure.

FINA 6212. Fixed Income Securities and Risk. 3 Hours.
Exposes students to theory, applications, and evidence concerning highly sensitive interest rate products. Discusses recent developments in pension fund management, asset/liability management, duration matching, “gap” management, concurrent interest rate and exchange rate management, and other important issues now confronting domestic and international financial and corporate management. Studies how to customize a risk management program.

FINA 6213. Investment Banking. 3 Hours.
Discusses policy, strategy, and administration of financial services firms. Topics include issuance of securities, the service function within financial services, pricing a negotiated issue of common stock or competitive bid issue, and meeting capital requirements of a securities firm.

FINA 6214. Mergers and Acquisitions. 3 Hours.
Explores the environments that have recently given rise to a large number of corporate mergers and the business factors underlying these corporate combinations. Examines the financial, managerial, accounting, and legal factors affecting mergers. Studies how to appraise a potential merger and structure a merger on advantageous terms.

FINA 6215. Business Turnarounds. 3 Hours.
Concentrates on the diagnosis, prescription, and implementation of actions pertinent to business turnarounds, troubled companies, workouts, bankruptcies, and liquidations. Case studies and readings guide the student through the maze of financial, ethical, legal, general business, and strategic aspects of turnarounds, culminating in the student evaluating and developing a turnaround plan.

FINA 6216. Valuation and Value Creation. 3 Hours.
Explores recent developments in financial management and financial analysis through the use of modern finance theory to make capital allocation decisions that lead to long-run value maximization for the corporation. Focuses on applications and financial model building, risk analysis for valuation applications, and business strategies to measure and manage corporate value and value creation. Topics are relevant to value consultants, corporate managers, and securities analysts.

FINA 6217. Real Estate Finance and Investment. 3 Hours.
Provides students with a comprehensive understanding of real estate finance. Emphasizes factors affecting real estate investment. Topics include valuation (appraisal), market analysis, development, taxation, ownership types, short-term financing, mortgage markets, and investment strategies. Designed for students interested in a general overview of real estate finance, as well as those intending to pursue a career in the real-estate field.

FINA 6218. Personal Financial Planning. 3 Hours.
Emphasizes the development of personal financial management knowledge by applying the techniques and perspectives of financial planning professionals. Examines the various aspects of financial planning, exploring how individual characteristics, such as age and economic circumstances, as well as the macroeconomy, impact decisions. Offers students an opportunity to develop a financial plan and identify how that plan changes with age and life circumstances. Note that while this course is not designed to prepare students to take the Certified Financial Planner exam, many of the topics, such as retirement planning, investment and securities planning, and estate planning, are among those discussed.
FINA 6219. Portfolio Management. 3 Hours.
Develops portfolio construction, revision, and performance measurement. Highlights portfolio construction in an efficient capital market. Topics include risk-return analysis, the effects of diversification on risk reduction, and the costs of inflation, taxes, and transaction costs on fixed income and equity security portfolios. Examines financial models of capital asset pricing as the basis for the analysis of portfolios from the institutional investor’s viewpoint.

FINA 6220. Healthcare Finance. 3 Hours.
Implements financial management and economic principles to analyze real-world healthcare issues. Emphasizes and encourages problem solving and creative thinking through the use of texts, cases, and models of the healthcare industry. Students are exposed to financial, managerial, and risk management strategies unique to the healthcare industry.

FINA 6221. Entrepreneurial Finance. 3 Hours.
Uses the basic processes, principles, tools, and concepts of finance within the parameters of a small business to develop a complete financial plan. Constructs a comprehensive plan that projects the future circular flow of funds by analyzing and then integrating the impact of both investment decisions (use of funds) and financial decisions (source of funds).

FINA 6222. Risk Management and Insurance. 3 Hours.
Introduces the concepts of risk and risk bearing in the business firm. Topics include risk identification and analysis, measurement of loss possibilities, and the principal methods of managing such contingencies. The focus is broad enough to include some nontraditional areas, such as speculative risk and foreign operations. Discusses insurance in detail as a major method of managing certain types of risks. Emphasis is on aspects that directly relate to the financial management function, such as insurance markets and products, selecting insurers and insurer intermediaries, legal frameworks involved in the transfer of risk to insurers, pricing of insurance contracts, and principles followed by insurers in selecting risks.

FINA 6225. Entrepreneurial Finance for High Tech Companies. 3 Hours.
Provides an overview of entrepreneurial finance with a focus on high-technology companies. Specific topics covered include analyzing the financial needs of high-technology ventures, including working capital management, risk analysis, capital budgeting, sources of financing, valuation, and exit strategies, including licensing, joint ventures, mergers and acquisitions, and initial public offerings (IPOs). Uses a combination of text material, books, and cases.

FINA 6230. Venture Capital and Startup Financing. 3 Hours.
Covers qualitative and quantitative aspects of entrepreneurial finance, such as venture capital and angel financing. Follows the firm’s life cycle, with modules on valuation, raising capital, security choice, and the structure and valuation of exit decisions in the presence of information uncertainty. Offers students an opportunity to analyze the role of financial contracts in addressing information and incentive problems in such uncertain environments, which is typical for entrepreneurial firms. Casework emphasizes the practical aspects of qualitative and quantitative issues related to venture capital financing, entrepreneurship, and innovation from the perspective of the financier and the startup firm. Seeks to prepare students for careers connected to entrepreneurial finance, for example, as budding entrepreneurs or as venture capitalists.

FINA 6231. Entrepreneurial Finance, Innovation Valuation, and Private Equity. 3 Hours.
Covers qualitative and quantitative aspects of entrepreneurial finance, such as venture capital and angel financing. Also covers private equity (i.e., buyout/leveraged buyout firms) but in less detail. Introduces students to valuation aspects in entrepreneurial finance, including valuation of startups, using real options to value innovation-intensive firms; valuation in staged financing; etc. Case-work emphasizes the practical aspects of qualitative and quantitative issues related to venture capital financing, entrepreneurship, and innovation from the perspective of the financier and the startup firm. Also covers many issues related to the venture capital industry, such as the limited partnership structure of the venture capital/private equity industry, venture capital term sheets and contracts, exit of portfolio firms, and international investments. May be repeated without limit.

FINA 6231. Disrupting the Finance and Insurance Service Industries. 3 Hours.
Offers a summary overview of fintech and how it is disrupting the financial services and insurance industries. Discusses key business, regulatory, and technical elements including, but not limited to, blockchain technologies, bitcoin, crowdsourcing, payment processing, changes in investment management, changes in commercial banking, and changes in insurance. Considers evolutionary changes taking place among incumbents and entrepreneurial startups in developed as well as emerging economies. Includes research articles, business cases, and guest speakers from the local fintech community.

FINA 6232. Strategies for Companies in Crisis. 3 Hours.
Examines companies in crisis, the flip side to the rapidly growing companies usually discussed in the High Tech MBA program. Focuses on approaches that help companies regain momentum and resume growth. Discusses downsizing and layoffs; operating, financial, and strategic turnarounds; bankruptcy; restructuring; product selection; quality management incentives; and other topics. Open to finance students.

FINA 6233. Economics of Growth and Innovation. 3 Hours.
Utilizes current economic events and changes that have transformed the competitive landscape to generate discussion about the future course of the world economy. Examines the intersection between economics and politics and the methods and means used by companies to compete. Uses simulations to illustrate the impact of market turmoil and competition on company performance. Offers students an opportunity to obtain a solid framework of economic knowledge to enable them to understand changes in the economy and to predict how policies will affect the economy and their company.
FINA 6284. Financing Innovation and Growth. 3 Hours.
Offers an immersion in corporate finance with a specific focus on the financing of innovation and growth at firms. Topics include analyzing and applying finance from the perspective of intrapreneurship as well as entrepreneurship.

FINA 6290. Financial Tools and Decision Making for Executives. 3 Hours.
Offers students an opportunity to develop skills needed to make and implement corporate financial policy decisions in a global economy. Introduces financial markets and the valuation of financial assets that trade in these markets. Studies financial analysis, financial planning, working capital management, cost of capital, and short- and long-term financial policies.

FINA 6291. Creating Value in a Global Business Environment. 3 Hours.
Offers students an opportunity to learn how firms can successfully sustain value creation and compete for capital in capital markets. Creating and sustaining corporate value is required for a company’s survival and growth. Introduces modern finance concepts to better understand how companies are valued and how they create value. Includes topics such as long-term financial strategy, capital planning, and management, and the initial public offering (IPO) process, mergers and acquisitions, and joint ventures. Explores situations in which theoretical finance assumptions do not apply in practice and discusses how the theory might be modified or relaxed to reflect the situation at hand.

FINA 6292. Advanced Topics in Finance. 3 Hours.
Examines current, specialized, and advanced topics in the areas of corporate finance, investments, risk management, valuation, private equity, venture capital, and other areas as appropriate. Course content, pedagogy, and prerequisites vary by topic and instructor.

FINA 6309. Foundations of Accounting and Finance. 3,4 Hours.
Explores key principles of accounting, as presented in the principal financial statements. Using those principles, explores a number of accounting practices and issues. Develops tools of financial analysis and financial planning and applies the information gained to business decision making. Utilizing the principle of time value of money to compare inflows and outflows of funds occurring at different times, develops basic decision tools for managers to make sound financial choices and to understand the context in which they are made. At the end of the course, the successful student should have a sound basic understanding of accounting and financial matters and the ability to understand business decisions in context and to evaluate the choices that management faces in the normal course of business development.

FINA 6360. Fund Management for Analysts. 1 Hour.
Introduces a variety of operating documents typical to an active mutual fund. Offers students an opportunity to apply lessons from investment and portfolio management classes by presenting investment recommendations to a panel and communicating with peers in a thoughtful and forceful manner. Investment decisions are made based on student analysis and recommendations that include knowledge of macroeconomic expectations, corporate financing issues, debt-repayment concerns, and employee and technological changes. May be repeated up to three times.

FINA 6361. Fund Management for Managers. 1 Hour.
Builds on FINA 6360. Designed to provide students further analytical knowledge, including exposure to and opportunity to perform managerial tasks related to the management and operation of mutual funds. Included in these tasks are reconsideration of the fund’s investment policy statement and asset allocation plan as well as preparation of accounting statements, dealing with compliance issues, addressing ethical concerns, measuring and managing risk, and performing marketing and fund-raising activities. May be repeated up to three times.

FINA 6960. Exam Preparation—Master’s. 0 Hours.
Offers the student the opportunity to prepare for the master’s qualifying exam under faculty supervision.

FINA 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FINA 6964. Co-op Work Experience. 0 Hours.
Provides eligible students with an opportunity for work experience. May be repeated without limit.

FINA 7976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.
FLNG 3101. Advanced Foreign Language Transfer 1. 4 Hours.
Offers credit for foreign language courses taken at other academic institutions.

FLNG 3102. Advanced Foreign Language Transfer 2. 4 Hours.
Offers credit for foreign language courses taken at other academic institutions.

FLNG 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

French (FRNH)

FRNH 1101. Elementary French 1. 4 Hours.
Designed for students with very little or no prior knowledge of French. Provides a lively introduction to basic oral expression, listening comprehension, and elementary reading and writing. The audiolingual approach, using practical vocabulary drawn from realistic situations, aims at good pronunciation and ease in response. Each lesson incorporates helpful information about daily life in France and the varied cultures within the world of French speakers. Laboratory practice complements class work, enables students to work aloud at their own speed, reinforces their acquisition of essential structures, and acquaints them with a vast library of audio-visual resources.

FRNH 1102. Elementary French 2. 4 Hours.
Continues FRNH 1101. Reviews and continues the study of grammar and basic language skills. Offers progressively more intensive practice in oral and written communication. Laboratory practice complements class work, enables students to work aloud at their own speed, reinforces their acquisition of essential structures, and acquaints them with a vast library of audio-visual resources.

FRNH 1201. Elementary French 1—BSIB. 4 Hours.
Designed to meet the special needs of students majoring in international business and who have very little or no prior knowledge of French. Provides a lively introduction to basic oral expression, listening comprehension, and elementary reading and writing. The audiolingual approach, using practical vocabulary drawn from realistic situations, aims at good pronunciation and ease in response. Each lesson incorporates helpful information about daily life in France and the varied cultures within the world of French speakers. Laboratory practice complements class work, enables students to work aloud at their own speed, reinforces their acquisition of essential structures, and acquaints them with a vast library of audio-visual resources.

FRNH 1202. Elementary French 2—BSIB. 4 Hours.
Continues FRNH 1201. Designed for the special needs of international business students. Reviews and continues the study of grammar and basic language skills. Offers progressively more intensive practice in oral and written communication. Laboratory practice complements class work, enables students to work aloud at their own speed, reinforces their acquisition of essential structures, and acquaints them with a vast library of audio-visual resources.

FRNH 1301. Elementary French Immersion 1. 4 Hours.
Designed for students who are in a French-speaking country, this is an off-campus immersion course. Offers students an opportunity to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

FRNH 1302. Elementary French Immersion 2. 4 Hours.
Designed for students who are in a French-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

FRNH 1900. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FRNH 2101. Intermediate French 1. 4 Hours.
Emphasizes further vocabulary building and mastery of fine points of grammar through written composition, prepared oral reports, and reading and discussion from current French periodicals.

FRNH 2102. Intermediate French 2. 4 Hours.
Continues FRNH 2101. Stresses the fundamentals of French to promote effective self-expression through speaking and writing and to explore the idiomatic aspects of the language. Through progressive class discussions and oral and written commentaries, students analyze a contemporary French novel or a French cultural reader, screenplay, or collection of short stories. Strives to help students read and comprehend modern French writing with confidence, and to be able to talk and write about it in good French. Provides preparation for advanced courses.

FRNH 2151. Intermediate French for Business Purposes. 4 Hours.
Focuses on oral and aural skills that are enhanced by the immersion environment. Offers elective credit for courses taken at other academic institutions.

FRNH 2201. Intermediate French 1—BSIB. 4 Hours.
Continues FRNH 2101. Designed to meet the special needs of international business students. Emphasizes communicating in a business environment, tailoring grammar and sentence pattern coverage, vocabulary, and cultural topics to a business setting. Combines contemporary business topics and intermediate business French. Offers students an opportunity to be prepared to communicate in speaking and writing in a business setting in France and with a better understanding of the current business culture in France. Students who do not meet course prerequisites may seek permission of instructor.

FRNH 2202. Intermediate French 2—BSIB. 4 Hours.
Continues FRNH 2201. Designed to meet the special needs of international business students. Emphasizes further vocabulary building and mastery of fine points of grammar through written composition, prepared oral reports, and reading and discussion from current French periodicals.

FRNH 2301. Intermediate French Immersion 1. 4 Hours.
Designed for students who are in a French-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

FRNH 2302. Intermediate French Immersion 2. 4 Hours.
Designed for students who are in a French-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.
FRNH 2900. Specialized Instruction in French. 1-4 Hours.
Designed for individuals whose language skills are at the intermediate level and who seek specially focused language instruction. Such instruction might be the use of the language in specific settings, or it might be focused on specific conversational nuances of the language. Students must have at least an elementary level of competence in the language. May be repeated without limit.

FRNH 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FRNH 3101. Advanced French 1. 4 Hours.
Continues further development of vocabulary. Offers students an opportunity to continue to master grammar and conversation through advanced reading, composition, grammar review, and listening skills. Whenever possible, offers students an opportunity to engage in local community activities to enhance communication skills and cultural knowledge.

FRNH 3102. Advanced French 2. 4 Hours.
Builds on FRNH 3101 and continues further development of vocabulary. Offers students an opportunity to continue to master grammar and conversation through advanced reading, composition, grammar review, and listening skills. Whenever possible, offers students an opportunity to engage in local community activities to enhance communication skills and cultural knowledge.

FRNH 3201. Advanced French 1—BSIB. 4 Hours.
Designed to meet the special needs of international business students. Stresses the fundamentals of French to promote effective self-expression through speaking and writing and to explore the idiomatic aspects of the language. Through progressive class discussions and oral and written commentaries, students analyze a contemporary French novel or a French cultural reader, screenplay, or collection of short stories. Strives to help students read and comprehend modern French writing with confidence, and to be able to talk and write about it in good French. Provides preparation for advanced courses.

FRNH 3202. Advanced French 2—BSIB. 4 Hours.
Continues FRNH 3201. Focuses on advanced conversation and composition work for international business students. Is the final language course before students go abroad. Enhances and reinforces those practical language and communication skills that students will encounter when they are abroad.

FRNH 3301. Advanced French Immersion 1. 4 Hours.
Designed for students who are in a French-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence.

FRNH 3302. Advanced French Immersion 2. 4 Hours.
Designed for students who are in a French-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence.

FRNH 3800. Special Topics in French. 1-4 Hours.
Focuses on a unique aspect of the French language. The specific topics are chosen to reflect current developments in the language and expressed student interests. Focuses on the use of the language for specific purposes or its use in specialized settings (e.g., media, business, health). Requires at least an intermediate level of skill in the language. May be repeated up to three times.

FRNH 3900. Specialized Instruction in French. 1-4 Hours.
Designed for individuals whose language skills are at an advanced level and who seek specially focused language instruction. Such instruction might be the use of the language in specific settings, or it might be focused on specific conversational nuances of the language. Requires at least an advanced level of competence in the language. May be repeated without limit.

FRNH 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FRNH 4201. Advanced Proficiency French 1—BSIB. 4 Hours.
Designed to meet the special needs of international business students. Builds on FRNH 3202. Offers students an opportunity to continue building vocabulary and master fine points of grammar through written composition, prepared oral reports, and reading and discussion based on assigned material. Restricted to international business majors only.

FRNH 4202. Advanced Proficiency French 2—BSIB. 4 Hours.
Designed to meet the special needs of international business students. Builds on FRNH 4201. Offers students an opportunity to continue building vocabulary and master fine points of grammar through written composition, prepared oral reports, and reading and discussion based on assigned material. Restricted to international business majors only.

FRNH 4800. Special Topics in French. 1-4 Hours.
Focuses on a unique aspect of the French language. The specific topics are chosen to reflect current developments in the language and expressed student interests. Focuses on the use of the language for specific purposes or its use in specialized settings (e.g., media, business, health). Requires at least an advanced level of skill in the language. May be repeated up to four times.

FRNH 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FRNH 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

FRNH 4992. Directed Study. 1-4 Hours.
Offers students a way of going beyond work given in the regular curriculum; may also enable students to complete major or minor requirements in certain situations. Priority is given to language majors and to juniors and seniors. May be repeated without limit.

FRNH 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

FRNH 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

FRNH 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

FRNH 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
FRN 0903. La Comédie Dans le Cinéma Français. 6.8 Hours.
Offers students the opportunity to examine the French sense of humor via the screening of French comedies. Examines available American remakes of these French movies to further understand the divergence and complexity of the cultural approach to humor. Examines the French comic psyche and compares it to the American sense of humor. Studies other relevant material, such as comic literature, jokes, comic books, and songs, to enhance understanding of laughter in both societies. This course is conducted in French.

FRN 0904. French Language Immersion. 6.8 Hours.
Offers students an opportunity to enhance their knowledge of today's French culture and to develop and sharpen their French skills through a variety of group activities. Emphasizes French and French only. Uses readings and other media supports to study and discuss various topics such as the French economy, France in Europe, religion and moral values, the regional languages, everyday life with its cultural misunderstandings, the French family, the media in France, and other topics. Utilizes activities and drills to update, reinforce, and expand knowledge in grammar and vocabulary.

FRN 0905. French Cinema. 6.8 Hours.
Utilizes French films to question and analyze the many aspects of French traditions. Offers teachers an opportunity to obtain the tools to incorporate a French film or an extract of a film into their classroom practice to illustrate a particular subject. This course is conducted only in French. Each film has been specifically selected to be used within the classroom at a middle or high school level. Following each film, teachers have an opportunity to enhance their skills through group discussion and activities. Group discussion focuses on the teachers' interpretation of the movies viewed that day, while group activities concentrate on the many ways a well-chosen movie can support various topics. This approach permits participants to develop and enhance their students' skills in the target language.

FRN 0906. Comparative French Cinema. 6.8 Hours.
Structured to enhance participants' knowledge of contemporary French culture by means of screening French movies and their American remakes. Designed to be a cultural study of both countries via the cinema. American directors often remake French movies in order to target an American public. Although the story line of these movies has usually been kept with very few changes, the cinematic approach is often markedly changed to adapt the film to the tastes of an American audience. Students view a series of five French movies along with their American remakes. By juxtaposing the original to the remake, students have the opportunity to take note of the many divergences and to study what has been changed, how, and why.

FRN 0910. French Cooking. 2.5 Hours.
Offers students an opportunity to experiment with French food and to discuss its cultural influences. Emphasizes the vocabulary of "la cuisine bourgeoise" and application of topics explored in this class in the K–12 classroom.

FRN 0913. La Cuisine Française Regionale. 6.8 Hours.
Offers students an opportunity to explore the richness and diversity of French culture and cuisine while honing one’s language skills. Explores the gastronomy of various regions of France, including Auvergne, Savoie, Bourgogne, Provence, and Alsace. Focuses on commonly prepared dishes while exploring the traditions of home cooking and how neighborhood location influences French cuisine. This course, advanced in its culinary and linguistic approach, is much more than a cooking course—it is an opportunity to explore France from a native’s perspective and to examine how teachers might incorporate that perspective into their classrooms.

FRN 0914. French in Context: Understanding French Culture. 6.8 Hours.
Conducted exclusively in French. Seeks to develop understanding of French culture through the study and analysis of various cultural topics. Offers participants an opportunity to enter the everyday life of the French and explore intricate themes such as government and politics, the judicial system, the social security benefits network, the school system, the economy of the country, and its place in Europe and in the world. Other topics include French media, the movie industry, the gastronomy, and of course the French language itself. Offers participants an opportunity to exercise their own oral and written language skills through online discussions and meetings. Requires good command (advance level or higher) of the French language in order to participate.

FRN 0915. Le Cinéma Francophone. 6.8 Hours.
Dedicated to francophone cinema. Various French-speaking regions, including Belgium, Province of Québec in Canada, Algeria, Morocco, Senegal, and Ivory Coast, are at the center of study. Viewings may include the Canadian La Face Cachée de la Lune, the Belgium Rosetta, and Entre Les Murs from France. Offers students an opportunity to discover how the culture and social structure of each country, the geographic location, its weather, and its economic status affect the way film directors produce films. Discussion, in French, follows each viewing.

FRN 0916. Literature in French Film. 6.8 Hours.
Seeks to give participants an opportunity to be fully immersed in the French language through literature and films based on popular readings. Encourages students to compare and contrast various films based on selected readings and to discuss and analyze both the novels and the films. Adaptation of novels by French directors can vary from being faithful to the books to a more fictionalized version. Offers participants an opportunity to debate the reasons why a storyline has been modified, changed, or suppressed. Extracts from such readings as Cyrano de Bergerac, La Femme du Boulanger, and Le Retour de Martin Guerre are part of the study. Conducted in French. Requires good command of the French language in order to participate.

FRN 5975. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

FRN 5977. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

FRN 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.
FRN 6503. La Comédie Dans le Cinéma Français. 4 Hours.
Offers students the opportunity to examine the French sense of humor via the screening of French comedies. Examines available American remakes of these French movies to further understand the divergence and complexity of the cultural approach to humor. Examines the French comic psyche and compares it to the American sense of humor. Studies other relevant material, such as comic literature, jokes, comic books, and songs, to enhance understanding of laughter in both societies. This course is conducted in French.

FRN 6504. French Language Immersion. 4 Hours.
Offers students an opportunity to enhance their knowledge of today’s French culture and to develop and sharpen their French skills through a variety of group activities. Emphasizes French and French only. Uses readings and other media supports to study and discuss various topics such as the French economy, France in Europe, religion and moral values, the regional languages, everyday life with its cultural misunderstandings, the French family, the media in France, and other topics. Utilizes activities and drills to update, reinforce, and expand knowledge in grammar and vocabulary.

FRN 6505. French Cinema. 4 Hours.
Utilizes French films to question and analyze the many aspects of French traditions. Offers teachers an opportunity to obtain the tools to incorporate a French film or an extract of a film into their classroom practice to illustrate a particular subject. This course is conducted only in French. Each film has been specifically selected to be used within the classroom at a middle or high school level. Following each film, teachers have an opportunity to enhance their skills through group discussion and activities. Group discussion focuses on the teachers’ interpretation of the movies viewed that day, while group activities concentrate on the many ways a well-chosen movie can support various topics. This approach permits participants to develop and enhance their students’ skills in the target language.

FRN 6506. Comparative French Cinema. 4 Hours.
Structured to enhance participants’ knowledge of contemporary French culture by means of screening French movies and their American remakes. Designed to be a cultural study of both countries via the cinema. American directors often remake French movies in order to target an American public. Although the story line of these movies has usually been kept with very few changes, the cinematic approach is often markedly changed to adapt the film to the tastes of an American audience. Students view a series of five French movies along with their American remakes. By juxtaposing the original to the remake, students have the opportunity to take note of the many divergences and to study what has been changed, how, and why.

FRN 6510. French Cooking. 2 Hours.
Offers students an opportunity to experiment with French food and to discuss its cultural influences. Emphasizes the vocabulary of “la cuisine bourgeoisie” and application of topics explored in this class in the K–12 classroom.

FRN 6513. La Cuisine Française Regionale. 4 Hours.
Offers students an opportunity to explore the richness and diversity of French culture and cuisine while honing one’s language skills. Explores the gastronomy of various regions of France, including Auvergne, Savoie, Bourgogne, Provence, and Alsace. Focuses on commonly prepared dishes while exploring the traditions of home cooking and how neighborhood location influences French cuisine. This course, advanced in its culinary and linguistic approach, is much more than a cooking course—it is an opportunity to explore France from a native’s perspective and to examine how teachers might incorporate that perspective into their classrooms.

FRN 6514. French in Context: Understanding French Culture. 4 Hours.
Conducted exclusively in French. Seeks to develop understanding of French culture through the study and analysis of various cultural topics. Offers participants an opportunity to enter the everyday life of the French and explore intricate themes such as government and politics, the judicial system, the social security benefits network, the school system, the economy of the country, and its place in Europe and in the world. Other topics include French media, the movie industry, the gastronomy, and of course the French language itself. Offers participants an opportunity to exercise their own oral and written language skills through online discussions and meetings. Requires good command (advance level or higher) of the French language in order to participate.

FRN 6515. Le Cinema Francophone. 4 Hours.
Dedicated to francophone cinema. Various French-speaking regions, including Belgium, Province of Québec in Canada, Algeria, Morocco, Senegal, and Ivory Coast, are at the center of study. Viewings may include the Canadian La Face Cachée de la Lune, the Belgium Rosetta, and Entre Les Murs from France. Offers students an opportunity to discover how the culture and social structure of each country, the geographic location, its weather, and its economic status affect the way film directors produce films. Discussion, in French, follows each viewing.

FRN 6516. Literature in French Film. 4 Hours.
Seeks to give participants an opportunity to be fully immersed in the French language through literature and films based on popular readings. Encourages students to compare and contrast various films based on selected readings and to discuss and analyze both the novels and the films. Adaptation of novels by French directors can vary from being faithful to the books to a more fictionalized version. Offers participants an opportunity to debate the reasons why a storyline has been modified, changed, or suppressed. Extracts from such readings as Cyrano de Bergerac, La Femme du Boulanger, and Le Retour de Martin Guerre are part of the study. Conducted in French. Requires good command of the French language in order to participate.

FRN 6951. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

FRN 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

FRN 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

FRN 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

FRN 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

FRN 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

FRN 6983. Topics. 1-4 Hours.
Covers special topics in French. May be repeated without limit.

FRN 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.
FDR 0101. The Annual Campaign: Taking the Mystery Out of Fund-Raising. 0.6 Hours.
Focuses on how to conduct an annual campaign. Reviews the creation of a campaign calendar, recruitment of annual campaign leadership, utilization of volunteers, event management, and the creation of collateral materials. Discusses how to create a case for support and how to train volunteer solicitors in techniques of personal and phone solicitation. Emphasizes practical solutions to fund-raising challenges; provides students with templates and materials that can easily be adapted to any organization.

FDR 0102. How to Develop a “Fundable” Program. 0.6 Hours.
Designed to help organizations turn a good idea into a program plan that can attract private and public funding. Offers students an opportunity to learn to identify “leverage points” so their program has more impact; to identify clear goals, objectives, and strategies; and to measure their success. Uses the development of a “logic model” to present a well-designed program concept and the basic elements of a grant proposal.

FDR 0103. Marketing Nonprofit Organizations. 0.6 Hours.
Covers how to market nonprofit organizations to generate needed publicity and resources. Uses and analyzes specific examples of successful marketing strategies.

FDR 0104. Grant Writing Basics. 0.6 Hours.
Offers students an opportunity to learn how to write grant proposals. Uses interactive and small group work to examine the elements of a proposal, what makes a proposal effective, and how to develop a strategy for highlighting what is unique and effective about their program. By the end of the course, students should have the outline of a grant proposal.

FDR 0105. Public Policy and Fund-Raising: Making the Connection. 0.6 Hours.
Offers service providers an opportunity to learn how to influence the public policies that affect their work and improve the ability of their organizations to raise funds in the process. Public policy influences the lives of all service providers and the communities they serve. Whether operating with state contracts, or serving a population that is reliant on publicly funded services, many providers want public policy makers to hear their perspective yet remain unsure of how to effectively communicate their message.

FDR 0106. Planning for Major Events. 0.6 Hours.
Offers students an opportunity to learn the essential elements needed for planning a successful event.

FDR 0107. Advanced Grant Writing. 1.2 Hour.
Offers nonprofit professionals an opportunity to become accomplished grant writers and to gain strong knowledge of grant writing and the skills needed to develop a successful proposal. Seeks to enable participants to leave with a complete grant application suitable for submitting to a private foundation, as well as a personalized library of resources for further skill development and identification of new sources of grant funding.

FDR 0108. Prospecting for Foundation Grants. 0.6 Hours.
Offers nonprofit professionals an opportunity to learn the skills needed to use three primary online resources of information (The Foundation Center, GuideStar, and the Associated Grantmakers of Massachusetts) to find sources of grant funding. During the course, participants use services normally reserved for subscribers, resulting in a tailored list of prospects for their project and a working knowledge of how to glean information specific to their needs from these sources.

FDR 0109. Conducting Capital Campaigns. 0.6 Hours.
Designed to walk participants through the key phases in planning and implementing a multi-million-dollar capital campaign.

FDR 0110. Raising Funds from Individuals. 0.6 Hours.
Offers students an opportunity to obtain a basic understanding of how and why individuals give financial support to organizations, the preparation to establish a comprehensive program of soliciting support from individuals, and the understanding of both the organizational and the personal skills necessary to raise money from individuals.

FDR 0111. The Annual Campaign: Taking the Mystery Out of Fund-Raising. 0.9 Hours.
Focuses on how to conduct an annual campaign. Reviews the creation of a campaign calendar, recruitment of annual campaign leadership, utilization of volunteers, event management, and the creation of collateral materials. Discusses how to create a case for support and how to train volunteer solicitors in techniques of personal solicitation as well as phone solicitation. Emphasizes practical solutions to fund-raising challenges; provides students with templates and materials that can easily be adapted to any organization.

GAME 1110. Games and Society. 4 Hours.
Provides an historical and cultural perspective on games and other forms of interactive entertainment. Examines the present state and future directions of paper, card, and board games; physical games and sports; and video games. Introduces students to current issues, experiments, and directions in the field of game design. Through weekly lectures and small-group labs, students have an opportunity to develop a critical basis for analyzing game play.

GAME 1850. Experimental Game Design. 4 Hours.
Explores traditions of games, play, participation, and procedurality in twentieth-century art movements, including Dada, Surrealism, Fluxus, conceptual art, the Situationists, Happenings, participatory performance and Tactical Media, avant-garde music, and contemporary art games. Through readings, lectures, and studio assignments, offers students an opportunity to understand and apply key principles by creating a series of artworks using various strategies drawn from these traditions, including appropriation, scores, intervention, and expression.

GAME 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GAME 2010. The Business of Games. 4 Hours.
Surveys a wide array of game-specific industry topics, including pitching and development of talking points, business models and revenue structures, studio organization and style, intellectual property, contracts, project management expectations, project green-lighting, production pipelines, return on investment, outsourcing, and marketing. Exploring historical shifts and evolution of the video game market offers students an opportunity to obtain perspective on the status of the industry and potential growth in the economy.

GAME 2150. Programming for Games. 4 Hours.
Offers students an opportunity to build computer game components and small complete games that explore physical principles in games, artificial intelligence, collision detection, and particle systems while gaining familiarity with common game engine libraries.
GAME 2200. Games and Learning. 4 Hours.
Describes the classical work on the relationship of play to learning and real life. Focuses on how players learn in and from games. Discusses how learning theories and principles relate to the design of entertainment games and games for impact. Also explores how game mechanisms can be applied beyond games such as in websites and education. Offers students, both in individual and group assignments, an opportunity to analyze and design game mechanisms to support learning, including writing game reviews and developing game concepts. Culminates in a final project in which students need to develop an analog or digital prototype.

GAME 2355. Narrative for Games. 4 Hours.
Examines and explores the structure and aesthetics of narrative, specifically in games. Begins by breaking down narrative into its various component parts that include, but are not restricted to, linear/branching narrative, emergent/inherent narrative, narrative obstacles, game pacing and narrative clock, character objectives, protagonist/antagonist, player/character, momentum and emotional journey, and tragic/comic elements. Offers students an opportunity to understand each narrative component through detailed case studies and the creation of narrative artifacts.

GAME 2500. Foundations of Game Design. 4 Hours.
Seeks to define the practice of game design within the larger context of playful interaction design, while constantly maintaining a player-centric approach. Unfolds the process of designing games between phases of analysis, synthesis, and evaluation. Establishes the role of game designer as an expert with a vision for determined player experiences and a vocal advocate for players. Seeks to offer students a broad methodology consisting of brainstorming methods, prototyping techniques, process management practices, and evaluation procedures to solve a wide array of design problems in an iterative manner.

GAME 2555. Games for Change. 4 Hours.
Offers students sound introduction to the psychological and behavioral theories of entertainment media with the goal of implementing these theories to the future design and evaluation of games for change. Focuses more on the psychological, behavioral, and social aspects of video games than on pure technical aspects. Organized around a collection of selected readings and real-world games and discussions. The final project is based on reflective thinking, critical evaluation, and creative application. COMM 2555 and GAME 2555 are cross-listed.

GAME 2650. Introduction to Game Research Methods. 4 Hours.
Surveys research methods and epistemologies relevant to game researchers, designers, and artists, including experimental studies; analytics, formal and historical analysis; ethnography; qualitative social research; and design research. Engages students in lectures, readings, and game faculty guest lectures presenting practical examples of methods discussed in the class. Seeks to familiarize students with core literatures on games, library research, and research design through a series of hypothetical research project drafts and the completion of a research project using a specific method covered in the class.

GAME 2750. Games Criticism and Theory. 4 Hours.
Covers fundamental theories of art, meaning-making, expression, cultural reflection, and criticism concerning media, games, and playful artifacts. Assigns several papers that offer students an opportunity to choose and apply different critical lenses to games, game criticism, and their own gameplay experience. A long-form paper allows students to train writing theoretically informed and argumentatively cogent critical presentations of games and gameplay experience.

GAME 2755. Games and Social Justice. 4 Hours.
Analyzes games from a social justice perspective, encouraging students to consider issues of social stereotyping, normalization, exclusion, and inequity as they apply to games from all sectors of the industry. Discusses and analyzes games using a variety of social theories from a diverse set of fields, including gender studies, critical race theory, and LGBTQ studies. Provides a studio setting in which students have an opportunity to engage in critical making of playable experiences that are based upon and deeply integrate social justice theories in their design.

GAME 2950. Game Studio. 4 Hours.
Offers an experiential learning course in which students collaborate with faculty on a project for credit, which may include research, game creation, or a combination of the two. Offers students an opportunity to co-produce a publishable, distributable, or exhibitable game and/or research paper, which can become part of the student’s portfolio. Course may be taught by an individual faculty member or team-taught to explore a specific topic, such as documentary games, art games, physical interfaces, installations, historical games, live-action role-playing, etc. Offers students an opportunity to gain experience working on a real-world project, as well as being credited for collaboration with an established practitioner/researcher. May be repeated once.

GAME 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GAME 3055. Playable Design. 4 Hours.
Covers how to design for playful engagement across contexts. Surveys basic theories and findings on play in ethology, evolutionary psychology, developmental psychology, anthropology, sociology, and philosophy through readings and discussion. Through lectures and exercises, familiarizes students with traditional design areas of play (toys, playgrounds, amusement parks) and the history, theory, patterns, and methods of evoking playfulness in contexts beyond games, toys, and playgrounds. Encourages students to apply these insights into portfolio work by creating playful experience prototypes across media.

GAME 3150. Game Design Algorithms. 4 Hours.
Seeks to extend student knowledge of common algorithms used in game design. Explores issues of cross-platform coding, mid-scale games, networked games, dynamic content systems, and working in a team-based coding environment. Working in small groups, students have an opportunity to develop and optimize a multiplayer game over the course of the semester.

GAME 3250. Artificial Intelligence for Games. 4 Hours.
Seeks to extend student knowledge of artificial intelligence techniques used in game design. Explores finite state machines, goal-driven agent behavior, graphs, in-game scripting, path finding, and fuzzy logic. Offers students an opportunity to work in pairs to develop intelligent agents to navigate a variety of game scenarios. Combines student projects competitively and collaboratively to test the robustness of the artificial intelligence solutions.

GAME 3300. Game Interface Design. 4 Hours.
Analyzes both successful and unsuccessful game interfaces from a historical and cultural perspective. Uses interactive design assignments to offer students an opportunity to develop an understanding of game user interface design standards. Encourages students to develop innovative interface designs that support new game content models.
GAME 3400. Level Design and Game Architecture. 4 Hours.
Analyzes game-level designs in a variety of genres and forms. Building upon basic drawing and design skills, students have an opportunity to develop paper prototypes and simple game “mods” in the context of story and game play. Students use computer-based tools to examine game-level architecture. Encourages students to take this elective in preparation for or in parallel to the Game Projects courses. ARTF 1122 and ARTF 1124 recommended (required for combined majors).

GAME 3700. Rapid Idea Prototyping for Games. 4 Hours.
Studies digital and nondigital prototyping techniques through weekly activities in which students build and critique prototypes around a variety of game design themes. Offers students an opportunity to build a portfolio of small proof-of-concept game prototypes over the course of the semester. Additionally, covers how to iterate on a single prototype through a semesterlong project in which students have an opportunity to work individually on a larger game design.

GAME 3800. Game Concept Development and Production. 4 Hours.
Offers student teams an opportunity to conceptualize, design, document, and develop a complete game, including content, level design, user interface, and game mechanics as specified in design documents. Offers a set of brainstorming techniques. Students segment the concepts into individual systems and prototype them in an iterative manner, formally iterating over the whole game to improve the player experience. Requires students to maintain a schedule and project management documents. Results in the presentation of the complete game for critique.

GAME 3899. Topics in Game Design. 4 Hours.
Offers a lecture or studio course in game design on a topic not regularly taught in a formal course. Topics may vary from offering to offering. May be repeated up to three times.

GAME 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GAME 4055. Motivational Game Design. 4 Hours.
Explores what motivations drive human behavior and how design can be used to motivate behavior in games. Offers students an opportunity to learn the main research models and findings about fun, enjoyment, and motivation, as well as to explore how design patterns facilitate these engaging qualities and how to apply this knowledge in practice through readings, lectures, autobiographical research, and the co-creation of a wiki of design lenses.

GAME 4155. Designing Imaginary Worlds. 4 Hours.
Offers students an opportunity to learn to conceive, design, and convey imaginary worlds across a wide range of media. The crafting of fictional worlds has become an important skill in the media landscape, whether for video and tabletop games, comic books, novels, film, or television. Analyzes existing works in diverse genres such as fantasy, science fiction, superhero, and supernatural worlds. Explores, through creative projects, the ways in which the use of different media are suited to portray different aspects of an imaginary world.

GAME 4355. Game Scripting. 4 Hours.
Offers students an opportunity to understand the basic principles of game engines and how to control games and game engines through relatively simple scripting techniques. Examines several different game engines, including those where scripting is visual and those where scripting is textual. Studies critical concepts, including the game loop and triggering/collision events. Offers students an opportunity to propose scripts to add to games and to work in teams to devise these scripts (pair programming) and the associated presentations (proposal and completed work). Students choose game engines and scripts to implement based on critical analysis of existing games and on their own aspirations for being innovative game designers.

GAME 4700. Game Design Capstone 1. 4 Hours.
Offers the first course in a two-semester capstone sequence. Offers students an opportunity to take on individual roles in a large-group project, creating a complete game from preproduction through implementation and testing. Students spend the first half of the first semester developing a proposal and testing ideas through simple prototypes, building on their skills from GAME 3700 and GAME 3800. Students then have an opportunity to spend the second half of the first semester, and all of the second semester, developing, play-testing, and iteratively refining a multi-level game.

GAME 4701. Game Design Capstone 2. 4 Hours.
Continues GAME 4700. Offers students an opportunity to continue developing, play-testing, and iteratively refining the multilevel game begun in GAME 4700.

GAME 4702. Directed Study. 1-4 Hours.
Provides study for the student whose unique academic needs or interests cannot adequately be satisfied in any of the scheduled courses of the department. May be repeated up to three times.

GAME 4703. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

GAME 4704. Internship. 4 Hours.
Provides students an opportunity for internship work. May be repeated without limit.

GAME 4706. Experiential Education Directed Study. 4 Hours.
Draws upon the student’s approved experiential activity and integrates it with study in the academic major. Restricted to those students who are using the course to fulfill their experiential education requirement. May be repeated without limit.
GSND 5110. Game Design and Analysis. 4 Hours.
Provides theoretical background and foundation for analyzing and designing games. Examines fundamental domains that are necessary to understand what games are and how they affect players, including but not limited to interface design, level design, narrative, learning, and culture. Presents relevant concepts and frameworks from a wide variety of disciplines—psychology, phenomenology, sociology, anthropology, media studies, affect theories, learning theories, and theories of motivation—for each domain. Explains the core elements of game design, introduces students to formal abstract design tools, explores several models of design process and iteration, and offers students an opportunity to practice game design in groups.

GSND 5111. Seminar for GSND 5110. 1 Hour.
Offers students an opportunity to discuss and analyze selected games, applying concepts from GSND 5110. Exposes students to a varied mix of AAA and indie titles and demonstrates how to analyze and appreciate them. Open to seniors; restricted to students in selected colleges.

GSND 5122. Business Models in the Game Industry. 1 Hour.
Examines the underlying business structure of the interactive digital entertainment industry and the characteristics of the various participants, notably developers and publishers. Seeks to deliver insight into key business models within the game industry and how the economic challenges interact. Explores the game business landscape across the industry spectrum, ranging from AAA, mobile, casual to indie development. Examines market strategies currently in practice and how they are linked with game analytics. Topics range from retail vs. online, free-to-play modes vs. pay-to-play, as well as basic monetization and distribution channels. Designed to serve as an overview of the various stakeholders in the industry and how they interact.

GSND 5130. Usability and Empirical User Research. 4 Hours.
Focuses on methods and methodologies from human-computer interaction (HCI) and their use in different applications, including apps, Web applications, games, and virtual worlds. Covers the basics of user-oriented evaluation, associated topics, and usability methods. Introduces the design process, usability heuristics, HCI paradigms, task models, and cognitive models. Examines quantitative and qualitative analysis of data. Offers students an opportunity to delve into experimental design, institutional-review-board approvals, ethics, research subject recruitment, and experiment implementations. Applies concepts through concrete projects, case examples, and exercises. Expects students to be running assignments continually and trying out different evaluation methods and methodologies.

GSND 6240. Exploratory Concept Design. 4 Hours.
Explores the process of designing new modalities of interaction utilizing novel uses of established technology, e.g., pervasive and affective technologies. Focuses on philosophy and practice of creating and evaluating experimental interactions. Recontextualizes gameplay concepts through permutations of basic elements such as controls, platforms, cameras, interfaces, etc. Leverages constraints as vehicles to push the boundaries of accepted design. Explores four key approaches to experimental interaction through course projects and assignments: discovering, examining, and exploring potential new technologies and interaction principles; rapidly designing and prototyping experimental interactions; pitching, justifying, and explaining designs and prototypes to others; and addressing new technologies and forms of interaction from a research perspective, focusing on their larger implications and potential impact on play.

GSND 6250. Spatial and Temporal Design. 4 Hours.
Explores the development and understanding of spaces used by people in 3D and 2D virtual environments. Uses an iterative process of making, criticizing, experiencing, and analyzing spatial form; compositional ideas for form making; and critical thinking. Offers students an opportunity to develop the arbitrary, yet necessary, mind-set needed to make assumptions about aesthetic spatial values and expected player behaviors. Analyzes the connection between spatial-aesthetic elements and their effects on players’ psyches. Experiments with how spaces, textures, shapes, and colors can support different synchronous moods. Explores how to shape spaces that fit the rational, emotional, and behavioral profile of different types of players. Applies concepts learned from architecture and game-level design to extend students’ creative and critical abilities.

GSND 6320. Psychology of Play. 4 Hours.
Explores theories of perception, motivation, needs, learning, goals, and belief systems as they pertain to games and play. Examines psychological principles, including visual and audio perception, emotions, behavior, personality, and the more recent scientific discoveries around psychological models explaining play behavior or motivation theories behind play. Introduces how players learn in and from games based on the relationship of play to learning theories. Forms a solid theoretical basis for a new segmentation tool—psychographics. Explores visual and cultural archetypes, digging into comics, movie sets, and cartoons to distillate what makes people tick in certain ways relating to universal theories of perception and gestalt theories. Applies the theories through critical analysis of play behavior and games.

GSND 6330. Game User Research. 4 Hours.
Focuses on topics of player psychology—cognition; memory; emotions; attention; and game-focused theories such as engagement, fun, user experience, player-need-satisfaction model, and flow. The development cycle of any game relies on the understanding of the players, the target market of the game product. Covers game usability engineering and game-specific evaluation methods, such as play testing, rapid iterative testing and evaluation (RITE), play-heuristic evaluation, and retrospective play reviews. Offers students an opportunity to learn how to analyze qualitative and quantitative data and to apply parametric and nonparametric statistical evaluation methods, qualitative data coding and analysis, and descriptive statistics. Requires students to apply visualization techniques of data and reporting.

GSND 6340. Advanced Game User Research. 4 Hours.
Builds on GSND 6330, covering the domain of psycho-physiological testing and more advanced statistics. Introduces theory and research in major areas of human psychology, including cognition, emotions, and attention. Studies the principles, theory, and applications of psycho-physiological assessment inside and outside interactive digital entertainment. Offers students an opportunity to understand the basics of eye tracking—eye movements, fixations, saccades. Applies methods of data collection, cleaning, and analysis for both physiological and eye-tracking data. Covers all issues of using such measurements, including validity of conclusions and confounding variables. Covers the process of triangulation and repotting in-depth along the entire process of the game production life cycle.
GSND 6350. Game Analytics. 4 Hours.
Introduces the topic of game analytics, defined as the process of discovering and communicating patterns in data with a goal of solving problems and developing predictions in user behavior supporting decision management, driving action, and/or improving game products. Covers the fundamental tools, methods, and principles of game analytics, including the knowledge-discovery process, data collection, feature extraction and selection, pattern recognition to aid in prediction and churn analysis, visualization, and reporting. Covers analytics across game forms, notably online games and delivery platforms. Presents analytical tools recommended during development and tools designed for ongoing maintenance of games.

GSND 6984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision. May be repeated up to four times.

GSND 7976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on chosen topics. May be repeated without limit.

GSND 7990. Thesis. 4 Hours.
Focuses on preparing a master’s thesis under faculty supervision.

GSND 7995. Games Project. 4 Hours.
Offers students an opportunity to obtain practical experience working on a project with a faculty member. Allows students to work with faculty in the program to develop their own project and apply the knowledge gained through the master’s courses.

GSND 7996. Thesis Continuation. 0 Hours.
Offers continued work on the thesis project.

General - CPS (GEN)

GEN 1890. Elective. 1-4 Hours.
Offers elective credit for science or technology courses taken at other academic institutions over seven years ago. May be repeated without limit.

GEN 5962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

General Engineering (GE)

GE 1000. Introduction to the Study of Engineering. 1 Hour.
Presents an introduction to the various disciplines of engineering and strategies for success in the classroom, within the profession, and within the University community. Provides an initial orientation to engineering cooperative education. Covers the support services provided by both college and University and explores the richness of our community’s diversity. Defines diversity, and offers students the opportunity to study and understand diverse cultures and communities in the academic environment. Oral presentations are required.

GE 1110. Engineering Design. 4 Hours.
Seeks to develop problem-solving skills used in engineering design, using case studies for a variety of engineering disciplines. Introduces students to the use of spreadsheet tools to solve engineering problems, including data reduction and visualization of data and functions. Design topics include problem formulation and specification, creativity, evaluation tools, patents, ergonomics, system design, manufacturing, ethics in engineering, and presentation techniques. Presents engineering graphics focusing on developing 3D visualization skills and computer-aided design (CAD) application. Students develop an original design solution to a technical problem as a term project. Requires students to have a laptop computer that meets the specifications of the College of Engineering.

GE 1111. Engineering Problem Solving and Computation. 4 Hours.
Uses a structured approach to solve engineering problems. Draws applications from a variety of engineering disciplines, which serve as a tool for introducing students to engineering analysis and design. Introduces a math application package for matrix applications and various real-life engineering problems. Includes the design of problem-solving algorithms using a high-level programming language. Requires students to have a laptop computer that meets the specifications of the College of Engineering.

GE 1201. Alternative Energy Technologies Abroad. 4 Hours.
Offers an interdisciplinary course that seeks to build an understanding of alternative energy systems and technologies and how they can impact the environment. Emphasizes how energy resources are being utilized currently in the United States and abroad and shows the need for new alternative energy technologies and their impact on sustainability. Introduces a variety of alternative/renewable energy technologies and their environmental impact. Lecturers include industry leaders in the field. Offers students an opportunity to visit companies to learn how these engineering technologies are being implemented. Aims to explain relevant alternative energy technologies in an interactive environment, where students engage in the field and examine their impact on society. May be repeated without limit.

GE 1202. Engineering Innovation and Discovery Abroad. 4 Hours.
Offers students an opportunity to apply engineering design principles to identify societal needs in the community abroad and propose real-life solutions that can be used to work with the local citizens to help improve their quality of life. Students actively engage in fieldwork with community members and help identify problems, societal needs, and the challenges to implementing technological solutions through innovation and social entrepreneurship. Project fieldwork includes, but is not limited to, local university peer partnerships; site visits with local families, businesses, and agricultural areas; and community service projects. May be repeated without limit.

GE 1210. Scientific Revolutions Abroad. 4 Hours.
Studies two revolutions in scientific thought—the Scientific Revolution of the seventeenth and eighteenth centuries and the computational revolution of the twentieth century. The Scientific Revolution gave scientists optimism that, in principle, they could understand everything about the world around them. In contrast, the revolutions in complexity, logic, computation, mathematics, and physics of the twentieth century put fundamental limits on what scientists could know and understand. Taught in Italy, this course explores the natural connections between the history of science taking place during the Italian Renaissance and scientific sites, including local museums, observatories, universities, laboratories, and archaeological sites. This material is contrasted with key results from chaos theory, computational complexity, logic, physics, quantum mechanics, and the theory of computation, all developed in the twentieth century.
GE 1501. Cornerstone of Engineering 1. 4 Hours.
Introduces students to the engineering design process and algorithmic thinking using a combination of lectures and hands-on projects and labs while encouraging critical thinking. Offers students an opportunity to develop creative problem-solving skills used in engineering design, to structure software, and to cultivate effective written and oral communication skills. Topics include the use of design and graphics communication software, spreadsheets, a high-level programming language, programmable microcontrollers as well as various electronic components, and 3-D printing. Requires students to develop an original design solution to a technical problem as a final term project. Requires students to have a laptop computer that meets the specifications of the College of Engineering.

GE 1502. Cornerstone of Engineering 2. 4 Hours.
Continues GE 1501 using a project-based approach under a unifying theme. Covers topics that introduce students to engineering analysis and design. Uses a math application package for matrix applications along with various real-life engineering problems solved using programming. Considers ethical reasoning in design and analysis, including ethical theories, professional codes, and emerging micro/macro issues in engineering. Introduces quantitative tools and ethical topics separately and weaves them into all design and problem-solving stages of the student projects. Covers 3-D assembly drawings and modeling, along with review and further work in design. Students work on open-ended design problems, developing working models and prototypes to demonstrate and present their designs. Requires students to have a laptop computer that meets the specifications of the College of Engineering.

GE 1990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GE 2000. Introduction to Engineering Co-op Education. 1 Hour.
Provides students preparation for the first co-op experience. Focuses on skills that provide a basis for successful co-op engagement including expectations and requirements, an introduction to professional credentials, résumé construction, self-assessment and goal setting, interviewing, professional and co-op ethics, issues of diversity in the workplace community, academic planning and decision making, and an introduction to career portfolios.

Explores principles of design that are found in nature. Studies evolutionary constraints in design, materials used in nature, structural designs that include hierarchy and multiscale components, methods of motion and how they evolved in nature, biological sensing structures, and ability to adapt. These natural design concepts are related to designs used in buildings, products, and machines. Offered in Oxford, England, a center for learning and evolutionary principles (from Darwin to Dawkins). Site visits include botanic gardens, the Natural History Museum, the Darwin collection, and Royal Veterinary College. A background in biology or engineering is not required; the course is intended for an interdisciplinary group of students (engineering, biology, architecture, product design, health sciences, innovation and entrepreneurship, anthropology) who are interested in exploring natural design.

GE 2361. Mathematical Methods for Engineers. 4 Hours.
Covers applications to applied mechanics, thermofluids, and dynamics/ control problems relevant to engineering. Topics include differential equations applied to modeling and characterization of processes, linear algebra used for multidimensional and complex system computations and modeling, and statistics and probability used for controls and signal analysis, among other applications. Introduces the foundational basis for approximate methods of engineering analysis, including its application to finite element analysis.

GE 2400. Limits on Scientific Knowledge: Chaos, Complexity, and Computability. 4 Hours.
Explores the principle of determinism, the belief that the future behavior of a system can be completely determined from its current state. This fundamental philosophy guided researchers from the ancient Greeks to Newton as they developed the laws of physics, chemistry, astronomy, and mathematics, which culminated in Newton’s laws of motion. Focuses on four important conceptual challenges, discovered during the twentieth century, which reduce the applicability of determinism and limit our ability to understand our world: chaos, complexity, uncertainty, and noncomputability. Discusses the dramatic effect these limits have had on diverse scientific disciplines and how scientists and engineers work to overcome them.

GE 2990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GE 3000. Professional Issues in Engineering. 1 Hour.
Provides students with an opportunity to reflect on both academic and co-op experiences in the context of planning for the senior year and beyond. Issues include professional and ethical issues, resolving ethical conflicts, awareness of engineers as professionals in a diverse world, strengthening decision-making skills, career portfolios, and lifelong learning needs, goals, and strategies. Students reflect upon issues of diversity from their experience in the University and in their cooperative education placements. Explores the role of different work and learning styles and diverse personal characteristics on the workplace and the classroom. Professional issues include impact of the cultural context, both in the United States and around the world, on the client, government relations, and the workplace.

Offers students an opportunity to obtain a sound scientific, technological, and economic understanding of our modern energy system and the challenge of energy sustainability. Covers principles of energy, work, and thermodynamics; technologies from supply and demand side, including extraction of primary energy, conversion into fuels and electricity, important energy end-uses, and energy losses; fossil, nuclear power plants, and renewable energy technologies (wind, solar, wave, hydro, geothermal, biofuels); transmission and distribution for electricity and fossil fuels; energy demand by buildings, transportation, and industry, emphasizing efficient technologies; sustainability concepts, including net energy/exergy analysis and life-cycle assessment, energy-related emissions, decentralized generation, smart grids, district heating, and net-zero energy facilities.

GE 3990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.
GE 4608. Nanotechnology in Engineering. 4 Hours.
Explores a wide range of new technologies based on, or influenced by, breakthroughs in nanoscience. Includes such nanotechnologies (the refinement of functional properties of materials, devices, or systems that are in at least one dimension smaller than 100 nm) as spintronics, quantum computing, carbon nanotube electronics, nanoparticle cancer remediation strategies, biomolecular electronics, and nanomachines. A general goal is the engineering of new or enhanced macroscopic properties from nanostructure or nanoscale materials and components. Offers students an opportunity to become well versed in this important burgeoning field through review of the scientific literature, classroom lecture, seminars by international leaders of nanotechnology, and student team projects.

GE 4892. Engineering Product Design and Prototyping Challenge Project. 4 Hours.
Offers students an opportunity to prepare detailed engineering designs and physical prototypes of technology-based products based on real-world specifications. Projects are carried out under the umbrella of the Generate organization within the Sherman Center for Engineering Entrepreneurship Education. Project proposals are developed in collaboration with the center director, including learning outcomes, project goals, and anticipated results/products. May be repeated up to nine times.

GE 4900. Career Management. 1 Hour.
Provides an interactive course designed to enhance an engineering student’s professional and career-related education through a series of classes taught by managers, engineers, and other professionals with industry experience. Topics include career services resources, developing skills to be an effective manager, the balance between personal and professional life, mentors, making career choices, time management vs. energy management, and others. May be repeated without limit.

GE 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GE 4993. Independent Study. 1-4 Hours.
Focuses on a subject that crosses traditional engineering boundaries. May be repeated without limit.

GE 5000. Special Topics in Engineering. 4 Hours.
Offers a course in which content is determined by the instructor. May be repeated up to three times.

GE 5010. Customer-Driven Technical Innovation for Engineers. 4 Hours.
Studies the role of engineering innovation in addressing customer needs in early start-ups and the need to conceive successful innovative engineering design as part of a commercialization strategy. Emphasizes understanding how engineering innovation can meet real technical market needs and how to gather the necessary, relevant technical information early in the innovation process to produce a successful engineering design. Uses a series of practical engineering design projects to demonstrate how students can assess the technical capabilities of the start-up in producing an innovative design, how to communicate with customers in an iterative engineering design process, and how to correspondingly design and innovate to meet customer technical requirements.

GE 5020. Engineering Product Design Methodology. 4 Hours.
Studies the iterative engineering design cycle of technology-intensive devices and tools with a focus on end-user technical specifications. Requires students to develop an engineering device or tool in a team-based workshop environment. Functional product concepts are generated by assessing technical needs of the intended user and refining the designs through testing with the end user. Focuses on methods of soliciting and documenting user technical feedback, relating that feedback to technical product requirements and specifications, and considering engineering manufacturing aspects. This course does not cover concepts in lean or rapid prototyping or methodologies relevant to services.

GE 5030. Iterative Product Prototyping for Engineers. 4 Hours.
Seeks to develop in-depth knowledge and experience in prototyping by focusing on engineering processes and instrumentation that are used in different industries. Studies the prototyping cycle, from initial process flow and sketching to prototype development to testing and analysis, with an emphasis on iteration. Analyzes how different kinds of engineering prototypes can address design and user-interface needs vs. functional needs, such as looks-like and works-like prototypes. Offers students an opportunity to obtain operating knowledge of methods including 3D printing, SolidWorks, off-the-shelf hardware-software interfaces, simulation, embedded systems, product testing, prototype analysis, and prototype iteration.

GE 5100. Product Development for Engineers. 4 Hours.
Focuses on the main processes needed to develop a complex, high-technology product. Emphasizes the most important techniques and approaches used in a startup environment. Seeks to benefit students of all engineering disciplines including computer science and biomedical, industrial, electrical, mechanical, computer, and chemical engineering. Includes a running practical project in which a new product is designed and executed through a series of small projects for each phase of the product development process. Topics include the product life cycle, new product development processes, project planning and management, new product idea generation, the systems approach to product development, design for manufacturing, market testing and launch, and escalation to manufacturing.

GET 1100. Introduction to Engineering and Technology. 3 Hours.
Analyzes the diversity, need, and applicability of engineering as the profession that solves technical problems and drives technological innovation. Discusses essential requirements to succeed academically in engineering and introduces useful tools to optimize academic performance, such as the use of computers to perform calculations and mathematics to communicate engineering ideas. Reviews simple concepts of science and mathematics in historical and quantitative context, and uses small projects and in-class demonstrations to acquaint students with engineering concepts behind common technological innovations. Discusses basic ideas for management of projects; techniques to formulate solutions to technical problems; and general structure for engineering design, manufacturing, and testing of products.
GET 1150. Foundations of Engineering Graphics and Design. 3 Hours. Offers students an opportunity to obtain basic engineering drafting and introductory design skills needed to function in a computer-aided drafting (CAD) environment. Covers the history of engineering hand drafting and the differences/similarities with respect to CAD tools used today. Discusses the basic steps of the engineering design process and how to apply these steps in small design projects where pictorial sketching and descriptive geometry (isometric and oblique drawings and projections) are used to communicate graphical solutions to proposed problems. Covers basic understanding of mechanical, electrical, and architectural layouts, and introduces basic dimensioning and tolerancing terms. Introduces the general features, capabilities, similarities, and differences among common engineering CAD software—such as SolidWorks, Autodesk AutoCAD, and PTC Creo—through introductory lab sessions.

GET 1990. Elective. 1-4 Hours. Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GET 2100. Computer Engineering Programming and Analysis. 3 Hours. Introduces the C++ programming language. Covers basic programming constructs and manipulation of data types including arrays, strings, and pointers. Offers students an opportunity to learn to isolate and fix common errors in C++ programs, to properly allocate/de-allocate procedures, and to apply object-oriented approaches to software problems in C++. Students use data structures of arrays, stacks, lists, trees, and graphs implemented using conventional programming techniques and class libraries. Students are asked to develop and write small-scale C++ programs using the skills covered during the lectures and practices in the laboratory.

GET 2200. Engineering Economy. 3 Hours. Studies the financial and economic concepts that are required to analyze engineering project financial performance, from the conceptual stage through the engineering and design stages. Examines time value of money, the tax consequences accruing relating to the project, as well as the advantages of utilizing financial leverage provided by various methods of raising required capital. Covers topics such as inflation, cost estimation, taxes and depreciation, decision trees, and risk and simulation. Stresses problem solving through case studies in order to enforce concepts and guidelines behind sound economic and financial decisions in engineering projects and enterprises.

GET 2990. Elective. 1-4 Hours. Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GET 3990. Elective. 1-4 Hours. Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GET 4840. Engineering Technology Capstone Project Preparation and Proposal. 2 Hours. Offers students an opportunity to apply the steps of the engineering design process and develop a comprehensive written engineering project proposal. Includes a review of the engineering design process from problem statement to prototype fabrication and testing. Working closely with the instructor, students are asked to identify a technological need of actual interest for local companies, communities, or students’ workplace and to follow the engineering design process. Students document the marketing, patent, and literature search for prior art, customer/engineering specifications, brainstorming process to generate feasible solutions, most viable solution selection process, and detailed labor and materials budget for actual execution of the solution to be completed in GET 4850.

GET 4850. Engineering Technology Capstone Project Execution. 4 Hours. Continues the design process initiated in GET 4840. Students implement the solution to the identified need/problem that they previously identified. This course is the culmination of the engineering technology academic curriculum, where students are expected to apply the knowledge and practice needed from a variety of domains in order to execute their plan of action and timeline of activities. The results of their work should culminate in the creation of an actual engineering system prototype along with a comprehensive final written report and oral presentation by team members.

GET 4950. Seminar. 1-4 Hours. Offers an in-depth study of selected topics.

GET 4955. Project. 1-4 Hours. Focuses on in-depth project in which a student conducts research or produces a product related to the student’s major field. May be repeated without limit.

GET 4983. Topics. 1-4 Hours. Covers special topics in general engineering technology. May be repeated without limit.

GET 4990. Elective. 1-4 Hours. Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GET 4991. Research. 1-4 Hours. Offers students an opportunity to conduct research under faculty supervision.

GET 4992. Directed Study. 1-4 Hours. Offers independent work under the direction of members of the department on a chosen topic.

GET 4993. Independent Study. 1-4 Hours. Offers independent work under the direction of members of the department on a chosen topic.

GET 4994. Internship. 1-4 Hours. Provides students with an opportunity for internship work.

GET 4995. Practicum. 1-4 Hours. Provides eligible students with an opportunity for practical experience.

GET 4996. Experiential Education Directed Study. 1-4 Hours. Draws upon the student’s approved experiential activity and integrates it with study in the academic major.

General Studies (GENS)

GENS 1101. Transitioning, Learning, and Connecting Seminar. 1 Hour. Designed to enhance academic success and help students transition to university life and academics. Uses a multimedia approach, diverse perspectives, and collaborative learning to challenge students to examine their assumptions and values by analyzing, synthesizing, and evaluating contemporary social issues and trends in popular culture. Emphasizes exploration of academic and career interests for student life-long success.

GENS 1102. Transitioning, Learning, and Connecting Seminar 2. 1 Hour. Continues the exploration of academic and career interest for life-long success. Focuses on research, argumentation, and oral presentations. Addresses the sophomore transition process to the destination colleges.
General Studies - CPS (GNS)

GNS 0050. Topics in General Studies. 0 Hours.
Offers a course covering topics in general studies. Topics are selected by the instructor and may vary from term to term. May be repeated without limit.

Geographic Information Systems - CPS (GIS)

GIS 5101. Introduction to Geographic Information Systems. 3 Hours.
Introduces the use of a geographic information system. Topics include applications of geographic information; spatial data collection; data accuracy and uncertainty; data visualization of cartographic principles; geographic analysis; and legal, economic, and ethical issues associated with the use of a geographic information system.

GIS 5102. Fundamentals of GIS Analysis. 3 Hours.
Explores the practical application of GIS to support geographic inquiry and decision making. Focuses on technical knowledge of the common tasks that a GIS analyst faces in applying GIS to a variety of spatial problems. Offers students an opportunity to gain hands-on experience with a leading commercial GIS software package.

GIS 5201. Advanced Spatial Analysis. 3 Hours.
Provides an in-depth evaluation of theoretical, mathematical, and computational foundations of GIS. Topics include spatial information theory, database theory, mathematical models of spatial objects, and GIS-based representation. Examines advanced concepts and techniques in raster-based GIS and high-level GIS modeling techniques.

GIS 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

GIS 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

GIS 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

GIS 6320. Use and Applications of Free and Open-Source GIS Desktop Software. 3 Hours.
Offers students an opportunity to become familiar with free open-sourced software (FOSS) GIS desktop applications (QGIS and GRASS) and implementations. This includes authoring and managing vector and raster data; performing cartographic output utilizing QGIS Desktop, QGIS Browser, and QGIS Print Composer; performing basic, intermediate, and advanced spatial analysis within QGIS and GRASS utilizing a variety of plug-ins and tools; creating geoprocessing models using the QGIS Graphical Modeler; and interacting with and managing spatial databases using QGIS DB Manager and PostGIS. The geospatial domain has seen an explosion in the availability of FOSS and data, so much so that geospatial intelligence use is encouraged by the United States Geospatial Intelligence Foundation (USGIF).

GIS 6340. GIS Customization. 3 Hours.
Offers an in-depth introduction to the customization of Esri ArcGIS using Python. Focuses on how Python is integrated into ArcGIS 10. Offers students an opportunity to gain a working knowledge of how to apply Python in ArcMap. Weekly assignments are designed to provide hands-on experience with ArcGIS, Modelbuilder, Python, geoprocessing, and ArcPy. Uses ESRI Virtual Campus classes to enhance the materials being explored in the text and exercises. Requires a basic understanding of ArcGIS.

GIS 6350. Planning a GIS Implementation. 3 Hours.
Emphasizes the process of planning a geographic information system (GIS) implementation so that the organization ends up with the “right” GIS. Focuses on understanding the planning process and the issues involved in preparing for the implementation of a GIS within a multiuser environment. GIS has the potential to benefit many different types of organizations in many different ways. Assignments seek to help students grasp the various stages of the process, including the understanding of organization strategy, needs assessments, capability definition, data design, system requirements, and organizational impacts. While the class uses enterprise-level GIS as the context for the planning process, the process discussed can also be applied to smaller-scale organizations and systems. Requires basic understanding of GIS and of basic information technology concepts.

GIS 6360. Spatial Databases. 3 Hours.
Offers students an opportunity to develop skills in acquiring and building spatial data and maintaining spatial databases. Analyzes fundamental theoretical knowledge about information systems and the unique demands created by geographic information. Includes data modeling and knowledge representation for spatial data, database schemas and models, and architectural principles for geographic information systems.

GIS 6370. Internet-Based GIS. 3 Hours.
Introduces the basic concepts associated with publishing spatial data and serving maps on the Internet. Examines the use of Internet mapping software, as well as the basics of designing and operating an effective map publishing and customization environment.

GIS 6380. Global Positioning Systems and Geographic Information Systems. 1 Hour.
Introduces both geographic information systems and global positioning systems technology, theory, and operation. Offers students an opportunity to gain hands-on experience collecting and integrating field positional data into a GIS, as well as learning how to prepare for and complete a field-based GPS survey.

GIS 6385. GIS/Cartography. 3 Hours.
Introduces the principles and concepts essential to thoughtful, informative, aesthetic, and effective map composition and layout. Topics include color theory, typography, data classification and symbology, cartographic design, critique, and production. Offers students an opportunity to focus on foundational cartographic concepts in order to improve their ability to create geographic visualizations that are able to communicate GIS information effectively.

GIS 6390. Business Applications of Geographic Information Systems. 3 Hours.
Explores the use of a geographic information system for business applications. Introduces spatial data analysis as it applies to sales, marketing, and demographic analysis; service and sales territories; call planning and routing; and reporting and presentation mapping. Offers students an opportunity to gain hands-on experience with the basic functionality of industry standard business mapping software.

GIS 6391. Healthcare Applications of Geographic Information Systems. 3 Hours.
Illustrates key applications, methods, and techniques of health incidence and management through the use of geographic information systems (GIS) software. Examines the uses and applications of GIS in the health industry as it is used by local agencies, such as public health units, and larger entities, such as the Center for Disease Control (CDC) and the World Health Organization (WHO). Offers students an opportunity to integrate GIS methods with a variety of situational tutorials, exploring issues such as the advantages and limitations of health data, culminating in a final course project.
German (GRMN)

**GRMN 1101. Elementary German 1. 4 Hours.**
Designed for students with very little or no prior knowledge of German. Provides a lively introduction to basic oral expression, listening comprehension, and elementary reading and writing. The audiolingual approach, using practical vocabulary drawn from realistic situations, aims at good pronunciation and ease in response. Each lesson incorporates helpful information about daily life in German. Laboratory practice complements class work, enables students to work aloud at their own speed, reinforces their acquisition of essential structures, and acquaints them with a vast library of audio-visual resources.

**GRMN 1102. Elementary German 2. 4 Hours.**
Continues GRMN 1101. Includes completion of basic grammatical usage, reading of contemporary German material, and increased stress on oral and aural skills.

**GRMN 1201. Elementary German 1—BSIB. 4 Hours.**
Designed to meet the special needs of international business students. Designed for students with very little or no prior knowledge of German. Provides a lively introduction to basic oral expression, listening comprehension, and elementary reading and writing. The audiolingual approach, using practical vocabulary drawn from realistic situations, aims at good pronunciation and ease in response. Each lesson incorporates helpful information about daily life in German. Laboratory practice complements class work, enables students to work aloud at their own speed, reinforces their acquisition of essential structures, and acquaints them with a vast library of audio-visual resources.

**GRMN 1202. Elementary German 2—BSIB. 4 Hours.**
Continues GRMN 1201. Designed to meet the special needs of international business students. Includes completion of basic grammatical usage, reading of contemporary German material, and increased stress on oral and aural skills.

**GRMN 1301. Elementary German Immersion 1. 4 Hours.**
Designed for students who are in a German-speaking country, this is an off-campus immersion course. Offers students an opportunity to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

**GRMN 1302. Elementary German Immersion 2. 4 Hours.**
Designed for students who are in a German-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

**GRMN 1990. Elective. 1-4 Hours.**
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

**GRMN 2101. Intermediate German 1. 4 Hours.**
Emphasizes further vocabulary building. Offers students an opportunity to master the fine points of grammar through written composition, prepared oral reports, and reading and discussion from contemporary German materials.

**GRMN 2102. Intermediate German 2. 4 Hours.**
Builds on GRMN 2101 and focuses on further development of vocabulary. Offers students an opportunity to continue to master grammar and conversation through written composition, prepared oral reports, and reading and discussion from contemporary German materials.
**GRMN 2151. Intermediate German for Business Purposes. 4 Hours.**
Designed for learners who possess the equivalent of one year of German study. Emphasizes communicating in a business environment by tailoring grammar and sentence pattern coverage, vocabulary, and cultural topics to the business setting. Combines contemporary business topics and intermediate business German. Offers students an opportunity to learn to communicate in a business setting in Germany, orally and in writing, as well as to better understand the current business culture in Germany. Students who do not meet course prerequisites may seek permission of instructor.

**GRMN 2201. Intermediate German 1—BSIB. 4 Hours.**
Designed to meet the special needs of international business students. Stresses more advanced German to promote effective self-expression through speaking and writing and to explore the idiomatic aspects of the language. Through progressive class discussions and oral and written commentaries, students analyze contemporary German texts. Practice includes watching German films, and participating in interviews in German.

**GRMN 2202. Intermediate German 2—BSIB. 4 Hours.**
Continues GRMN 2201. Designed to meet the special needs of international business students. Provides opportunities to expand vocabulary and develop flexibility in the four basic language skills. Topics include grammar review and continued exposure to modern texts and business language usage.

**GRMN 2301. Intermediate German Immersion 1. 4 Hours.**
Designed for students who are in a German-speaking country, this is an off-campus immersion course. Focuses on standard German. Continues development of grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

**GRMN 2302. Intermediate German Immersion 2. 4 Hours.**
Designed for students who are in a German-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

**GRMN 2900. Specialized Instruction in German. 1-4 Hours.**
Designed for individuals whose language skills are at the intermediate level and who seek specially focused language instruction. Such instruction might be the use of the language in specific settings, or it might be focused on specific conversational nuances of the language. Students must have at least an elementary level of competence in the language. May be repeated without limit.

**GRMN 2990. Elective. 1-4 Hours.**
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

**GRMN 3101. Advanced German 1. 4 Hours.**
Continues further development of vocabulary. Offers students an opportunity to continue to master grammar and conversation through advanced reading, composition, grammar review, and listening skills. Whenever possible, offers students an opportunity to engage in local community activities to enhance communication skills and cultural knowledge.

**GRMN 3102. Advanced German 2. 4 Hours.**
Builds on GRMN 3101 and continues further development of vocabulary. Offers students an opportunity to continue to master grammar and conversation through advanced reading, composition, grammar review, and listening skills. Whenever possible, offers students an opportunity to engage in local community activities to enhance communication skills and cultural knowledge.

**GRMN 3201. Advanced German 1—BSIB. 4 Hours.**
Designed to meet the special needs of international business students. Strives to develop facility in speaking and writing German and stresses active use of the language. Includes weekly composition assignments and grammar reviews as needed.

**GRMN 3202. Advanced German 2—BSIB. 4 Hours.**
Continues GRMN 3201. Offers advanced conversation and composition work for international business students. Is the final language course before students go abroad. Enhances and reinforces those practical language and communication skills students will encounter when they are abroad.

**GRMN 3301. Advanced German Immersion 1. 4 Hours.**
Designed for students who are in a German-speaking country, this is an off-campus immersion course. Focuses on standard German as well as the local dialect. Continues development of grammatical and conversational competence.

**GRMN 3302. Advanced German Immersion 2. 4 Hours.**
Designed for students who are in a German-speaking country, this is an off-campus immersion course. Focuses on standard German as well as the local dialect. Offers students an opportunity to continue to develop grammatical and conversational competence.

**GRMN 3800. Special Topics in German. 1-4 Hours.**
Focuses on a unique aspect of the German language. The specific topics are chosen to reflect current developments in the language and expressed student interests. Focuses on the use of the language for specific purposes or its use in specialized settings (e.g., media, business, health). Requires at least an intermediate level of skill in the language. May be repeated up to three times.

**GRMN 3900. Specialized Instruction in German. 1-4 Hours.**
Designed for students who are in a German-speaking country, this is an off-campus immersion course. Offers students an opportunity to continue to develop grammatical and conversational competence. Focuses on oral and aural skills that are enhanced by the immersion environment.

**GRMN 3990. Elective. 1-4 Hours.**
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

**GRMN 4201. Advanced Proficiency German 1—BSIB. 4 Hours.**
Designed to meet the special needs of international business students. Strives to develop facility in speaking and writing German and stresses active use of the language. Includes weekly composition assignments and grammar reviews as needed.

**GRMN 4202. Advanced Proficiency German 2—BSIB. 4 Hours.**
Designed to meet the special needs of international business students. Strives to develop facility in speaking and writing German and stresses active use of the language. Includes weekly composition assignments and grammar reviews as needed.

**GRMN 4800. Special Topics in German. 1-4 Hours.**
Focuses on a unique aspect of the German language. The specific topics are chosen to reflect current developments in the language and expressed student interests. Focuses on the use of the language for specific purposes or its use in specialized settings (e.g., media, business, health). Requires at least an advanced level of skill in the language. May be repeated up to four times.
GRMN 4990. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GRMN 4991. Research. 4 Hours.
Offers an opportunity to conduct research under faculty supervision. May be repeated without limit.

GRMN 4992. Directed Study. 1-4 Hours.
Offers students a way of going beyond work given in the regular curriculum; may also enable students to complete major or minor requirements in certain situations. Priority is given to language majors and to juniors and seniors. May be repeated without limit.

GRMN 4993. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated up to three times.

GRMN 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

GRMN 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic. Course content depends on instructor. May be repeated without limit.

GRMN 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GST 0941. Global Studies: GPACT South Africa. 30 Hours.
Offers students an opportunity to participate in an intensive three-week Global Partnership for Activism and Cross-Cultural Training (GPACT) program at Rhodes University, Grahamstown, South Africa. Covers the essentials of global citizenship and how to form a nongovernment organization to respond to local and global problems. Students work and live with South African university students.

GST 6000. Political Philosophy for Global Studies. 4 Hours.
Examines major philosophers throughout history who have tried to define, explain, and elaborate on concepts and issues such as human rights and conduct, state interference, and civilizational progress. These issues persist today in globalization. Studies source documents and original thinkers who provide a foundation for current discussions. Asks students to consider how these ideas can shed light on the agglomerated processes of globalization and whether globalization has affected these issues. Offers students an opportunity to develop more informed and weighted judgments on the multisided nature of political issues.

GST 6100. Globalization and Global Politics and Economics. 4 Hours.
Examines the multifaceted nature of politics and economics in an expanding global world. Analyzes the impact of globalization on political and economic systems, such as capitalism, democracy, socialism, nationalism, totalitarianism, and populism. Introduces students to the use of quantitative methods in the analysis of global relationships. Offers students an opportunity to use these tools to hypothesize the impact of future global trends on contemporary political and economic systems.

GST 6101. Global Literacy, Culture, and Community. 4 Hours.
Introduces basic theories of culture, identity, and communication. Topics may include race, ethnicity, social class, gender, national identity, and religion. Explores these theories and topics through an in-depth study of a particular aspect of culture within a chosen country. Introduces students to the use of qualitative methods in the analysis of culture and communication. Offers students an opportunity to use these tools to hypothesize the impact of future global trends on contemporary cultures and identities.

GST 6102. Global Corporate and Social Responsibility. 4 Hours.
Examines the social responsibilities of corporations and individuals in the global twenty-first century. Topics may include outsourcing, offshoring, international labor laws, global environmental responsibility, global human rights, global citizenship, and sustainable development. Focuses on the use of qualitative and quantitative methods in the analysis of current policies and practices of multinational corporations, nation-states, and international non-governmental organizations.

GST 6108. Introduction to Quantitative Research and Applied Statistics. 2 Hours.
Introduces quantitative methods and a practical guide to statistical application for social scientific research. Discusses the theory and methodology of statistics, strengths and weaknesses of quantitative data, correlation, hypothesis testing, and regression analysis. Exposes students through lectures and practical application with example problems to managing and organizing data and summarizing and representing data graphically.
GST 6109. Basic Field Research Methods. 4 Hours.
Focuses on research and analysis, which are a central part of scholarly learning. To understand the nature of how information is gathered, processed, and communicated, it is imperative that students familiarize themselves with and cultivate basic research methods used in the field of social sciences. Exposes students to the essentials of field research methods, covering various research methods as well as their applications, advantages and disadvantages, and limitations. Examines different types of studies and methods and seeks to help students prepare for field research work, effective online and library data retrieval, analyzing research data and information, and writing of a thesis paper.

GST 6110. Seminar in Global Training. 8 Hours.
Offers students an opportunity to prepare to engage in independent research, distance, and online learning, with a culminating experience in a select country or countries. Utilizes on-campus meetings or online with the professor to prepare and orient the student to the country or countries being studied. Students are then led by faculty to various global locations over two or three weeks. Through site visits, guest lectures, and on-the-ground experiences, students advance their own research questions and develop their own analyses. In a debriefing on-campus at Northeastern or online with the professor, the experience is customized to the individual professional development needs of each student. In general, each course seeks to provide students with an in-depth overview of that country’s politics, economics, history, society, and/or language.

GST 6200. The Funders. 4 Hours.
Focuses on the financial organizations and enabling institutions of globalization. Studies the actions of the holders of financial power—“the Funders”—such as the WTO, IMF, G8, and the World Bank.

GST 6210. The Developers. 4 Hours.
Focuses on the community-based groups and movements that shape popular opinion about and activism in response to living in a global world. Beginning with the social movement concept, the course examines the emergence of a global civil society that operates on a dynamic of advocacy and development mobilized by grassroots-based economic organizations and individuals.

GST 6220. Globalization of Emerging Economies. 4 Hours.
Examines the rising status and influence of countries categorized as “emerging economies” and whether this status is sufficient to make them a viable long-term challenge to U.S. political and economic power. Some are significant regional players. Collectively, they are seen as challenging U.S. hegemony in their region and beyond, and they have called for a larger role in global decision making for the developing world. Examines how these emerging economies become a potent force in the global economy and their impact on various stages of the international arena. Discussions may include a review of specific regional impacts, implications for international security, and effects on international aid policies.

GST 6300. Security and Terrorism. 4 Hours.
Examines the issues of security and terrorism in relation to globalization. Covers the objectives of terrorism and the implications for defining and implementing global security policy, monitoring and controlling weapons proliferation, and initiating acts of counterterrorism. Examines the impact and linkage of terrorism and security on economic development, human rights in counterterrorism, and counterintelligence activities.

GST 6310. Immigration and Labor. 4 Hours.
Examines the issues of immigration and labor in relation to globalization. Covers the changing role of blue- and white-collar labor in the global world and the impact of these changes on perceptions of work and labor. Explores outsourcing, offshoring, immigrant communities, citizenship, activism, and immigration in their global and historical contexts.

GST 6320. Peace and Conflict. 4 Hours.
Examines peace and conflict from a variety of vantage points: as the two interact and emerge from intrastate violence; terrorism; and such concerns as water scarcity, food security, cyber security, disarmament, and arms control.

GST 6321. Violence and Societies. 4 Hours.
Examines the interpersonal and structural characteristics, causes, and consequences of violence and hate from a sociological perspective. Focuses on individual acts of aggression to large-scale intergroup conflict with particular emphasis on ethnic and intercultural groups. Explores the effectiveness of interventions. Topics include international conflict, hate crimes, prejudice, and genocide.

GST 6322. Survey of the Field of Conflict Management. 4 Hours.
Covers basic theory and research in the conflict resolution field. Provides an overview of ways to analyze, understand, explain, and predict conflicts and the effectiveness of interventions designed to solve them, including reconciliation and follow-up. The content is applicable to individuals, groups, and organizations, nationally and internationally.

GST 6323. Intercultural Communication and Negotiation. 4 Hours.
Helps students acquire an opportunity to recognize and manage conflict between and among multiple cultures and ethnicities using verbal and nonverbal cues and to identify and apply effective culturally appropriate strategies through role-plays and simulations. The skills learned in this communication-based course may be applied to a diverse workforce or global communications at home or international settings abroad.

GST 6324. Divided Societies in the Modern World. 4 Hours.
Examines the importance of culture and ethnicity in understanding conflict. Provides an overview of key concepts, ideas, and debates in the field; causes; dynamics, and policy options for resolution of social conflict using comparative international case studies.

GST 6325. Group Dynamics, Conflict, and Multicultural Teams. 4 Hours.
Examines common problems within organizations and intervention techniques. As companies expand globally, reporting relationships may cross international boundaries and individuals increasingly work in international teams. Tensions associated with such interactions may increase. A central part of the course involves role-plays and evaluations of such interactions.

GST 6326. Peace and Conflict. 4 Hours.
Examines peace and conflict from a variety of vantage points: as the two interact and emerge from intrastate violence; terrorism; and such concerns as water scarcity, food security, cyber security, disarmament, and arms control.

GST 6327. Conflict and Postconflict Development. 4 Hours.
Focuses on peace planning and conflict prevention and the vital role that local and international NGOs and public/private partnerships are playing in slowly bringing conflict communities together. Presents case studies on reconciliation and confidence-building measures in societies and countries engaged in long-term conflict and how entities such as the media can hamper or facilitate resolution.
GST 6330. Global Issues: Religion, the State, and Society. 4 Hours.
Examines the relationship of religion, the state, and society in the global world. Examines the changing role of religion and religious institutions as they move to take on new roles that increasingly challenge state control, reshape societal and political values, and empower particular social movements.

GST 6340. Poverty and Wealth. 4 Hours.
Examines models of economic growth and the underlying theories of development, which shape efforts in both developed and developing countries. Introduces the use of economic indicators and measurements of development with reference to situations that have led to economic crises and subsequent responses by governments and institutions. Examines the predominant policy responses of rich and poor countries to the challenges of development, including issues of international assistance and recent trends in poverty reduction and participatory development.

GST 6350. Global Economics of Food and Agriculture. 4 Hours.
Designed to provide students with a broad-based understanding of the global food system, while assessing its performance in terms of satisfying world food needs. Examines international dimensions of food system performance, including global trade and international aid; supply and demand trends and their implications for global food security; food and agricultural trade policies; ethics and safety regulations; and specific national food systems. Also examines specific commodity chains and their impact on economic development.

GST 6360. Nuclear Nonproliferation. 4 Hours.
Examines the history and development of all forms of nuclear weapons from World War II to the present. Decades after the invention of nuclear weapons, the issue of proliferation continues to occupy a significant position in both U.S. and global political discussions. Traces the history of arms control efforts; the role of science and technology; the impact of international organizations set up to monitor and regulate nuclear weapons; and the proliferation of nuclear weapons and their impact on international relations.

GST 6400. Global Focus: Healthcare and Biotechnology. 4 Hours.
Examines the intersection of healthcare and biotechnology. Begins with an overview of the healthcare and biotechnology fields. Considers how both fields are evolving in the rapidly advancing world of global medicine. Concludes with a discussion on the new ethics and business of global medicine as it concerns capitalism, global pandemics, and poverty.

GST 6410. Global Education in the Internet Age. 4 Hours.
Examines education and information technology and their emerging mutuality in the global world. Focuses on the role of information technology in making education more accessible to nontraditional students. Considers education as information technology pushes new subjects to be considered for learning. Ends with a discussion on possible future trends of education and information technology working together and the impact such will have on the next generation of students and industry.

GST 6420. Global Focus: Media and Communication Technology. 4 Hours.
Examines media and communication technology and its informing impact on social structure, state leadership, and political change. Considers the new roles for media and communication technology, including the rise of satellite television, Internet broadcasting, hand-held communication devices, and amateur media productions. Encourages students to conduct case studies of real-world examples as they consider the intersection of media and communication technology in future economic, societal, and political applications.

GST 6430. Leadership and Management. 4 Hours.
Examines leadership and management and the changes to both of growing global realities. Considers the evolving understanding of how leadership and management are evaluated when cross-cultural, cross-border, and increasingly complex human and economic transactions take place. Examines real-world examples of changing leadership demands and the economic realities that increasingly drive managerial innovation.

GST 6440. Global Focus: Resources and Markets. 4 Hours.
Examines how emerging market economies and natural resource exporters pursue development in light of constraints. Emphasizes issues of environmental conservation and human rights and how emerging powers work to influence the rules of the game. Explores both the internal and external efforts toward liberalizing emerging market economies. Introduces issues of foreign direct investment (FDI), outsourcing/offshoring, the existence of informal/parallel markets, and recent trends of microfinance and remittances.

GST 6500. Global Hot Spots: China and India. 4 Hours.
Focuses on two emerging economic heavyweights in the global economy: China and India. Emphasizes examining the reasons for each country's ascendancy, the impact their rise is having on their neighbors and the world, and the potential opportunity each presents for causing major shifts in global political, economic, and social headquartering.

GST 6501. Regional Studies: East Asia. 4 Hours.
Examines regional stability and cooperation, efforts to foster democracy and human rights, and policies that have led toward increased trade and rapid economic prosperity. Explores pressures on traditional societies confronting globalization, changing roles of women, demands for improved education, along with challenges from transnational crime such as money laundering, trafficking in persons, and narcotics smuggling.

GST 6502. Regional Studies: Middle East. 4 Hours.
Examines the Middle East from historical, sociological, political, and economic perspectives. Traces the origins and ongoing efforts toward a two-state solution to the Palestinian-Israeli conflict. Explores ongoing efforts across the region for political and economic reform, the growth of civil society, and the strain on traditional societies in an increasingly globalized world. Studies the roots of sectarian conflicts, the problem of terrorism, and the proliferation of conventional weapons as well as weapons of mass destruction.

GST 6503. Regional Studies: Sub-Saharan Africa. 4 Hours.
Examines issues in Sub-Saharan Africa surrounding democratic governance, civil society, and regional cooperation; the role of economic growth and development; efforts in conflict prevention, mitigation and resolution; challenges in the fields of health, agriculture, energy, education, and the role of women; and the problem of transnational crimes such as narcotics smuggling, the arms trade, and trafficking in persons.

GST 6504. Regional Studies: Europe. 4 Hours.
Covers Europe in the postwar era from political, economic, and security dimensions. Explores the role of modern NATO; the challenges and prospects for increasing regional integration, both within and beyond the European Union; the problems facing postcommunist states; and Europe's efforts to build global support for democracy, human rights, civil society, economic prosperity, and security.

GST 6505. Regional Studies: Southwest and Central Asia. 4 Hours.
Focuses on countries of Central Asia as well as the subcontinent. Explores economic development, political transition, education, security, health, environmental challenges, religion, and the changing role of women in this region.
GST 6506. Regional Studies: Latin America. 4 Hours.
Covers all of Central and South America and the Caribbean. Explores economic development in the poorest regions; managing rapid growth elsewhere; and approaches to challenges including democratization, rule of law, civil society, health, narcotics, environment, and regional economic integration.

GST 6510. Global Hot Spots: Eastern Europe and the Middle East. 4 Hours.
Focuses on eastern Europe and the Middle East and their rapid experiences of cultural and social change. Examines some of the major reasons for rapid change in these areas. Covers the creation of new political, social, and economic actors and their intertwining linkages. Social movements and the backlash they have experienced from the state form an important part of the course.

GST 6520. Global Hot Spots: Africa and the Caribbean. 4 Hours.
Focuses on Africa and the Caribbean and brings together two key cultural areas of the African diaspora. Examines some of the major political, social, and economic reasons for the largely forced migration of millions of Africans to North, South, and Central America. Analyzes the creation of new types of Afro-Caribbean culture, language, and societal groupings that came from the diaspora and the impact these have on today’s political and economic systems in both areas.

GST 6530. Global Hot Spots: Europe and North Africa. 4 Hours.
Offers students an opportunity to better understand the origins and contemporary practice of Islam in North Africa and in Europe; investigate the dynamics of North Africa as a multicultural society—Arab, Berber, African, and European; consider the complex relationship between local North African economies and European economic trends; and identify the promises and problems involved in modernization in the postcolonial African/Islamic/Arab worlds.

GST 6540. Politics of the European Union. 4 Hours.
Explores various political, economic, and social aspects of creation and functioning of the European Union. Introduces the politics, structure of governance, institutional design, and various policies of the European Union. Begins with a historical overview of the European integration process and surveys various theories of integration. Separate sessions cover particular topics, such as history and evolution of the EU integration, major institutions, interinstitutional dynamics of governance, and role member states. The second part of the course deals with current key policy issues, such as environment, enlargement, immigration, EU citizenship, crime prevention and terrorism, monetary union, CFSP, euro scepticism, and democratic deficit.

GST 6550. U.S. Foreign Policy. 4 Hours.
Examines the U.S. role in the world by focusing on the dynamics of power in the international system. Explores the theoretical foundations, historical contexts, and domestic sources of past and present U.S. foreign policy choices. Case materials and topics may include humanitarian intervention, nuclear proliferation, the global economy, tensions in the Middle East, and bilateral relations between the United States and such nations as China, Russia, Cuba, or Colombia. Debates the efficacy and ethics of U.S. global power and the future of the U.S.-dominated liberal world order.

GST 6560. Multilateral Diplomacy. 4 Hours.
Studies how nations, nongovernmental organizations, multinational organizations, and other international actors advance their agendas in global and regional forums. Using an issues-based case study and applied approach, offers students an opportunity to explore how members promote diplomatic initiatives and engage in collaboration, coalition building, and negotiation within the context of multilateral organizations.

GST 6580. Opportunities in International Consulting. 4 Hours.
Explores international business across countries and sectors. Constitutes a first step in introducing students to concepts that cover various aspects of the private sector’s role in international relations. Uses consultancy case studies and other readings.

GST 6590. Public Diplomacy. 4 Hours.
Examines how governments communicate directly with foreign publics for the purpose of improving image, advocating policy, and shaping public opinion. Explores radio and television broadcasting across borders, cultural programming, educational exchange programs, visitor programs, libraries and language institutes, and the impact of social media. Case studies illustrate topics such as global media and international journalism, propaganda, media in democracies and totalitarian states, media influence on foreign policy, the digital divide, intellectual property, and privacy.

GST 6600. The Practice of Diplomacy. 4 Hours.
Explores the practice and process of diplomacy and the work of foreign ministries, embassies, and consulates. Introduces students to representation, reporting, negotiation, intercultural contacts, and consular affairs, as well as interaction with the media, the private sector, and civil society. Offers students an opportunity to obtain a knowledge base and develop professional skills important to the diplomatic profession, including policy analysis, written and oral communication, and negotiation. Students use extensive simulations, role-playing, and case studies.

GST 6610. Sustainable Development. 4 Hours.
Examines the basic tools of policy analysis in the area of sustainable development. Introduces various techniques used by states, NGOs, and private corporations trying to create viable policy. These may include game theory, cost-benefit analysis, and critical mass models. Utilizes global case studies to analyze current policy and consider political viability of development programs. At the conclusion of the course, students are required to produce policy recommendations and a policy memo.

GST 6700. Global Health Perspectives, Politics, and Experiences in International Development. 4 Hours.
Examines the linkages between health and development that can only be understood within the broader context of sociopolitical and economic factors. Begins with the recognition that poverty plays a central role in many preventable diseases. With the development of nations have come improvements in health. In the landscape of globalization and international development, there has emerged a vast international health regime. Focuses on these linkages in the context of this international political economy of health. Examines key aspects including the concepts and architecture of global health, the global burden and epidemiology of disease, health and development of nations, and political-economic determinants of health and development. Uses a variety of analytical perspectives including political, legal, economic, and epidemiological.
GST 6710. Critical Issues and Challenges in the Practice of Global Health. 4 Hours.
Examines the critical issues in global health. Focuses on roles of different actors in the delivery of healthcare services, healthcare delivery systems, key initiatives and strategies to meet the burden of major diseases, planning and managing national and global health programs, emerging medical health technologies, pharmaceutical polices, marketization of healthcare, the human resources for health, etc. Begins by recognizing that, despite improvements in health across the world over the last half century, vast challenges remain for a majority of people in developing countries. Analyzes the cutting-edge issues and knowledge that are at the forefront of the global health policy agenda today. Uses a practical and policy-analytical approach with illustrative case-based analysis and extensive coverage of material.

GST 6720. Emerging Infectious Diseases and Health Impacts of Social and Environmental Changes. 4 Hours.
Examines topics such as the health consequences of ecological change, extreme weather events, water-related health impacts, proliferation and control of infectious diseases, and complex emergencies. Begins by noting that, as scientific evidence for a rapidly changing climate mounts, population health faces increasing risks because most diseases have environmental determinants. While in the last three decades more than thirty new diseases have emerged, old infectious diseases still persist and are reemerging with new strains resistant to known vaccines and medicines. Rapid travel, trade, urbanization, and westernization contribute to the rise in noncommunicable disease. Civil, economic, and political disruptions also pose severe challenges to the public health preparedness and capacities of nations to respond to complex health emergencies.

GST 6730. Health and Human Rights and Ethical Issues in Global Health Futures. 4 Hours.
Explores how politics, economic concerns, law, and ethics interact to shape healthcare policy decision making and implementation of healthcare programs through the human rights framework. Begins by noting that the United Nations' universal human rights framework asserts that all persons have a right to the "enjoyment of the highest attainable standard of physical and mental health." In reality, however, vast inequalities exist within and across nations. As Leonard Fleck asks in his book, Just Caring (2009), in providing healthcare, "who lives, who pays, who decides?" Topics include the right to health and healthcare, prioritization of health resources, health disparities and inequalities, corruption, ethics in research, responsibility for individual and public health, genetics and bioethics in emerging medical technologies, and health for the twenty-first century.

GST 6740. Human Rights. 4 Hours.
Introduces students to the concept of international human rights. Focuses on the role of global, regional, and national institutions to protect human rights as well as create and enforce human rights law. Explores the role of nongovernmental organizations and the media in fact-finding and publicizing human rights violations, along with current issues and case studies.

GST 6810. International Higher Education. 4 Hours.
Examines the phenomenon of global student mobility and internationalization of both campuses and curricula. Looks at historical landmarks in student and faculty exchanges, government-sponsored programs, recruiting practices, and the development of cross-cultural competencies. This is an introductory course.

GST 6820. Managing Study Abroad. 4 Hours.
Focuses on the experience of American students, faculty, and their home institutions as they travel overseas for educational purposes. Begins with historical foundations such as “Junior Year Abroad” and continues to the present day, exploring trends in enhancing cross-cultural learning, faculty-led programs, service-learning, and experiential programs.

GST 6830. Managing International Students. 4 Hours.
Explores how increasing numbers of international students from diverse countries can best be managed to increase campus internationalization, avoid clustering, provide rich experiences for domestic students, and cope with cultural adaptation.

GST 6840. The Business of International Education. 4 Hours.
Explores the role of third-party study-abroad providers, recruiters, program developers, and nonprofit organizations dedicated to student and faculty exchanges and their growing relationship with U.S. university campuses. Examines the financial costs and benefits inherent in offering a growing range of international programs.

GST 6850. Immigration and Legal Issues in International Higher Education. 4 Hours.
Focuses on the necessary legal knowledge for managers running international student offices on campuses. Covers visa and immigration law from the U.S. perspective. Includes legal knowledge study-abroad staff need—such as crisis management, insurance, physical and mental health issues, and liability problems—as staff assist both American students who travel in increasing numbers to nontraditional destinations and international students who come to their campuses.

GST 6920. Case Study in Global Studies. 4 Hours.
Offers an integrative, summative course for the master's degree that builds on the understanding and concepts of global studies learned throughout the program. The curriculum draws heavily upon learning outcomes and acquired skills from both the global studies core courses and advanced electives in the concentration. Throughout the course, the instructor leads students through a step-by-step process of researching and writing a well-defined project, from the initial construction of a research question through the final stages of editing and revision. Course assignments may include group projects and individual presentations. At the conclusion of the course, students should have finished a portfolio piece capable of demonstrating their application of concepts and methods learned throughout their studies.

GST 6938. Global Studies: Politics and Economics. 4 Hours.
Provides an in-depth overview of politics and economics in the country of study. Exposes students directly to economic and political systems. Offers students an opportunity to visit government and private institutions, such as high schools, hospitals, non-governmental organizations, and businesses, and to participate in dialogues with students and faculty at universities in the country of study. Facilitates students, through faculty mentoring and field research, as they conduct independent research. Emphasizes independent work of students advancing their own research questions, as well as writing their own analysis and critiques of readings and their research overall.

GST 6939. Global: History and Society. 4 Hours.
Offers students an in-depth overview of history and society in the country of study. Allows students to visit historical and cultural sites and other public institutions as well as to participate in dialogues with students and faculty at universities in the country of study. Facilitates students, through faculty mentoring and field research, as they conduct independent research. Emphasizes independent work of students advancing their own research questions, as well as writing their own analysis and critiques of readings and their research overall.
GST 6961. Internship. 1-6 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

GST 6962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions. May be repeated without limit.

GST 6964. Co-op. 0 Hours.
Provides eligible students with an opportunity for work experience.

GST 6966. Practicum. 1-4 Hours.
Provides eligible students with an opportunity for practical experience.

GST 6970. Seminar. 1-4 Hours.
Offers an in-depth study of selected topics.

GST 6980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

GST 6983. Topics. 1-4 Hours.
Covers special topics in global studies. May be repeated without limit.

GST 6995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student's major field. May be repeated without limit.

GST 7961. Internship. 1-4 Hours.
Provides students with an opportunity for internship work. May be repeated without limit.

GST 7962. Elective. 1-4 Hours.
Offers elective credit for courses taken at other academic institutions.

GST 7976. Directed Study. 1-4 Hours.
Offers students an opportunity to carry out an individual reading and research project under the supervision of a faculty member. The directed study format allows for the in-depth analysis of a particular topic not covered in-depth or the study of a subject not typically covered in the curriculum. A directed study proposal must be approved by the faculty sponsor, division head, and dean of academic affairs.

GST 7978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

GST 7980. Capstone. 1-4 Hours.
Offers students an opportunity to integrate their course work, knowledge, and experiences into a capstone project.

GST 7983. Topics. 1-4 Hours.
Covers special topics in global studies. May be repeated without limit.

GST 7990. Thesis. 1-8 Hours.
Offers thesis supervision by members of the department.

GST 7994. Thesis Continuation—PT. 0 Hours.
Offers continuing thesis supervision by members of the department.

GST 7995. Project. 1-4 Hours.
Focuses on in-depth project in which a student conducts research or produces a product related to the student's major field. May be repeated without limit.

GST 7996. Thesis Continuation. 0 Hours.
Offers continuing thesis supervision by members of the department.

Graduate Engineering - CPS (GSE)

GSE 0902. Robotics: Fundamentals. 6.8 Hours.
Introduces teachers of grades 6–12 to the principles of engineering design and to the foundations of engineering on applied sciences and mathematics. Outlines the design process, examines input factors, and uses case studies for implementation. Stresses the importance of solid scientific foundations as well as creativity, optimization, safety, ethics, aesthetics, reliability, durability, serviceability, cost, and market acceptability. The engineering design steps include the development and use of design methodologies, formulation of design problem statements and specifications, consideration of alternative solutions, feasibility considerations, and detailed system descriptions. This hands-on course is aligned with the Massachusetts Science and Technology/Engineering Framework.

GSE 0903. Robotics: Engineering Technology in Practice. 6.8 Hours.
Offers students an opportunity to complete a practical implementation working with middle school students from the local school district who design and build robotic devices. The course provides an enrichment opportunity for children in a laboratory environment involving participating teachers who practice concepts and techniques learned in GSE 0902.

GSE 0904. Robotics: Engineering Technology in Practice. 8.7 Hours.
Offers participants an opportunity to complete a practical implementation working with middle school students from the local school district who design and build robotic devices. Provides an enrichment opportunity for children in a laboratory environment involving participating teachers, who practice concepts and techniques learned in the associated course.

GSE 5976. Directed Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

GSE 5978. Independent Study. 1-4 Hours.
Offers independent work under the direction of members of the department on a chosen topic.

GSE 5984. Research. 1-4 Hours.
Offers students an opportunity to conduct research under faculty supervision.

GSE 6501. From Science to Engineering: Preengineering Design. 4 Hours.
Introduces teachers of grades 6–12 to the principles of engineering design and to the foundations of engineering on applied sciences and mathematics. The design process is outlined, input factors are examined, and implementation takes place with case studies. Stresses the importance of solid scientific foundations as well as creativity, optimization, safety, ethics, aesthetics, reliability, durability, serviceability, cost, and market acceptability. The engineering design steps include the development and use of design methodologies, formulation of design problem statements and specifications, consideration of alternative solutions, feasibility considerations, and detailed system descriptions. This is a hands-on course, aligned with the Massachusetts Science and Technology/Engineering Curriculum Framework.

GSE 6502. Robotics: Fundamentals. 4 Hours.
